AT THE COUNCIL CHAMBER, WHITEHALL

THIS 23RD DAY OF OCTOBER, 1906.

PRESENT :

THE RIGHT HONOURABLE DAVID LLOYD GEORGE, M.P

The Board of Trade are pleased to appoint the following gentlemen, viz —

Sir ALFRED BATEMAN, K.C.M.G., Chairman,
Mr. A. WILSON FOX, C.B., Board of Trade,
Mr. CHARLES A. HARRIS, C.B., C.M.G., Colonial Office,
The Rt. Hon. Sir JAMES KITSON, Bart., M.P.,*
Mr. ALGERNON LAW, Foreign Office,
Mr. MALCOLM RAMSAY, C.B., Treasury,
Sir SWIRE SMITH, and
Mr. SAMUEL J. WARING

to be a Committee to enquire and report as to the nature and extent of the benefit accruing to British Arts, Industries and Trade, from the participation of this country in Great International Exhibitions, whether the results have been such as to warrant His Majesty's Government in giving financial support to similar exhibitions in future ; and, if so, what steps if any, are desirable in order to secure the maximum advantage from any public money expended on this object.

The Board are further pleased to appoint Mr. U. F. WINTOUR to be Secretary to the Committee.

(Signed) D. LLOYD GEORGE.

Whitehall, 2nd November, 1906.

The Board of Trade are pleased to appoint Sir ISIDORE SPIELMANN to be an additional member of the Committee appointed to enquire and report as to the nature and extent of the benefit accruing to British Arts, Industries, and Trade from the participation of this country in Great International Exhibitions.

(Signed) D. LLOYD GEORGE.

* Since created Lord Airedale.

REPORT

To the Right Hon. DAVID LLOYD-GEORGE, M.P., President of the Board of Trade.

SIR,

In accordance with the instructions contained in your Minute of the 23rd of October 1906, we have given our careful consideration to the question of British participation in Great International Exhibitions, and have now the honour to make the following Report with regard thereto.

The terms of our reference were :

Terms of Reference.

"To enquire and report as to the nature and extent of the benefit accruing to British Arts, Industries, and Trade from the participation of this country in Great International Exhibitions ; whether the results have been such as to warrant His Majesty's Government in giving financial support to similar exhibitions in future ; and, if so, what steps, if any, are desirable in order to secure the maximum advantage from any public money expended on this object."

Meetings held Witnesses examined.

Since the date of our appointment we have held 30 meetings, and have examined fifty-six witnesses. In the course of our enquiry we have had the advantage of hearing the opinions of a number of gentlemen who have had practical experience in connection with the organisation and preparation of British exhibits at Great International Exhibitions in the past, and we have also endeavoured, as far as possible, to ascertain the views held by manufacturers and traders in each of the principal industries of this country with regard to the questions referred to us.

With this object a form of questions was prepared and sent with a circular letter to some of the leading firms in each of the principal industries in the United Kingdom asking for their views as to the value of Great International Exhibitions as a means of increasing their trade with foreign countries, and also for any observations or suggestions which they might have to offer generally with regard to the questions covered by our terms of reference. Six hundred firms in all were consulted in this manner. In the greater number of cases the firms were asked whether they desired to supplement the information contained in their written reply, by giving evidence before the Committee, and a number of manufacturers and traders subsequently availed themselves of the opportunity thus afforded to them.

Chambers of Commerce consulted.

The leading Chambers of Commerce were also invited, at an early stage of our enquiry, to nominate representatives to give evidence before the Committee, and valuable information has, as a result, been furnished to us by the London, Manchester, Bradford and Blackburn Chambers of Commerce.

Copies of the circular lists of questions addressed to those bodies, and also to individual manufacturers and traders, will be found in the Appendix to this Report.

Reports from H.M. Representatives abroad.

In addition to the information thus obtained from the persons principally interested in exhibition matters in the United Kingdom, reports have also been furnished to us by H.M. Representatives in Austria-Hungary, Belgium, France, Germany, Italy, Switzerland, the United States of America, and Japan, with regard to the participation of those countries in Great International Exhibitions, and in the case of France the written information furnished to us was further supplemented by the personal evidence of H.M. Commercial Attaché at Paris, who specially visited London for that purpose.

Copies of the circular enquiry addressed through the Foreign Office to H.M. Representatives abroad and of the Reports received from them will be found in the Appendix to this Report.

PART I.—GENERAL EFFECT OF EXHIBITIONS ON BRITISH ARTS, INDUSTRIES AND TRADE.

The connection of this country with International Exhibitions began with the Great Exhibition of 1851 in London. Whether the commercial results of this Exhibition were altogether favourable to Great Britain has since been questioned; but the example set by ourselves was immediately followed by our neighbours, and since 1851 International Exhibitions have been held at close intervals in all the important countries of the world.

Meaning of the term International Exhibition.

The term "International Exhibition" admits of more than one interpretation. In its strictest sense the expression may be held to mean an Exhibition officially initiated and organised by, or under the auspices of, the Government of the country in which it is held, and in which other countries are officially invited to participate by the originating Power. To this class belong the Exhibitions at London in 1851, at Paris in 1900, and at St. Louis in 1904.

In a broader sense the term has been applied to Exhibitions which, while not organised by Government and not subsidised from public funds, derive their claim to an international character mainly from the fact that they are open to the products of more than one nation.

Again there have been international Exhibitions confined to the exhibits of various nations in a particular industry; but for the present purpose an exhaustive classification seems unnecessary. We have interpreted the reference as applying primarily to the great International Exhibitions which properly deserve the term, and which are not confined to the products of any particular industry.

The first question with which we are called upon to deal, under our terms of reference, is the nature and extent of the benefit accruing to British arts, industries and trade from the participation of this country in great International Exhibitions.

It will, in our opinion, be more convenient in dealing with this section of our enquiry if we reverse the order of this question and deal first with the more important aspect of Exhibitions—*i.e.*, their relation to British trade.

Number of interests involved.

Owing to the enormous growth of the manufacturing industries of the world in recent years, and the constant development of new and, in many cases, highly specialised industries, the interests which have to be taken into account in considering the effect which any particular form of enterprise may have upon British trade as a whole are very numerous and varied. Thus Exhibitions which possibly offer no special advantages to manufacturers of heavy goods, such as steam locomotives or marine engines, may be of very real value in pushing the sale of motor-cars, and a form of advertisement which may be of comparatively little use as a whole to highly organised industries, such as the cotton or woollen industries, may be of considerable importance to the trades which they supply.

The varying conditions of industrial development in different countries have also an important bearing upon the conclusions which may be formed on this subject, and an exhibition which may offer special advantages as an advertisement for one trade may prove to be of little or no value to another, owing to the highly developed state of that industry in the country in which the exhibition is held. Thus a manufacturer of agricultural machinery, who could expect but little profit from exhibiting his goods at an Exhibition in the United States of America, might derive benefit through showing them in Russia, and a maker of aniline dyes, who might be reluctant, for the same reason, to exhibit his products at Berlin, might be willing to show them at St. Louis or Chicago.

It is further a matter of considerable difficulty in forming an estimate of the effect which Exhibitions have had on any particular trade, to distinguish between the direct commercial results in the shape of increased orders which may be obtained as the result of exhibiting by individual firms, and the indirect benefit which they, in common with other manufacturers, may derive from the general advertisement which is afforded by a national display of this character.

Numerous other considerations, such, for instance, as the educational value of exhibitions and their effect upon the general, commercial and political relations of the participating countries, have also to be taken into account before it is possible to decide how far the official participation of this country (which may be held to imply financial assistance from public funds) has been justified by the results.

obtained; but before commenting in any detail upon these aspects of the problem, it will perhaps be convenient to describe briefly, as it appears to us, the general attitude of manufacturers in this country with regard to Exhibitions as a means of directly increasing their business.

A.—The Direct Effect of Exhibitions on Trade.

Reluctance of many manufacturers to exhibit at recent Exhibitions.

There can be no doubt, generally speaking, that from the personal point of view, Great International Exhibitions are not universally regarded with favour by manufacturers in this country. Increasing difficulty has been experienced in organising a representative display of British manufactures at all the Great International Exhibitions in which this country has taken part in recent years, and in many instances it has only been owing to the exercise of considerable pressure on the part of individual members of the organising body that the leading firms in certain industries have been induced to participate.

This reluctance to exhibit has undoubtedly increased considerably in recent years, and would appear to be attributable to a variety of causes.

Exhibitions have lost their novelty

In the first place it should be observed that since the middle of the last century, when the first of these great International Exhibitions was inaugurated in London, in the year 1851, Exhibitions have been held with increasing frequency, and their novelty has to a large extent worn off.

Other kinds of advertisement improved.

Considerable progress has been made of recent years in the art of advertising, and the advertisement afforded by displaying goods at an International Exhibition is consequently regarded by many as being of less importance than formerly, particularly when regard is had to the very great changes which have taken place in the character of the Exhibitions themselves. It is suggested that owing to the immense size to which modern Exhibitions, such as those at Paris in 1900 or at St. Louis in 1904, have attained, individual exhibits which do not form part of a large and striking national display are liable to pass unnoticed by the majority of visitors, and that in any case they cannot hope to attract the same degree of attention as was possible in earlier days when Exhibitions were more of a novelty, and were more strictly confined to the display of manufactured articles and objects of art.

Unsuitable surroundings.

Another consideration which appears to weigh with manufacturers of standing is the unbusinesslike and undignified manner in which they are apt to be mixed up with (*a*) what they call "fakers"—*i.e.*, the paltry dealers in cheap articles of ornament and amusement which do not represent British industry; and (*b*) the general element of popular amusement which has become part of the life of the modern Exhibition. There is an opinion that Exhibitions are nowadays promoted and kept open less with a view to the furtherance of trade interests than with the object of attracting visitors and achieving financial success from the receipt of gate-money. The number of side shows and other entertainments has, in consequence, increased to a very great extent at recent Exhibitions, and it is thought by many that this has resulted in attracting, as visitors to the Exhibition, pleasure-seekers rather than serious students or possible customers. There is no doubt that, in the opinion of many manufacturers, the changes to which we have alluded have materially diminished the value of exhibiting as a means of obtaining direct orders for their goods.

Decrease in the value of Awards.

There appears also to be a very general feeling that the value of the awards obtained by successful exhibitors at these Exhibitions has largely decreased owing to the frequency with which Exhibitions are now held, and also owing to the indiscriminate manner in which awards are often bestowed. Many firms, it is true, still attach considerable importance to awards, both as a general advertisement and as affording a useful guarantee of the superiority of their goods in tendering for contracts and the like; but the belief is undoubtedly gaining ground that buyers at the present day rely more and more on their own judgment in making their purchases, and that awards are consequently of considerably less value than was formerly the case. Awards, it is pointed out, have at most of the recent Exhibitions been granted to so large a number of Exhibitors that they cannot possibly carry the same weight as in earlier years when they were less lavishly bestowed, and when the distinction of a "Grand Prix" carried with it the reputation of being among the first manufacturers of the world in the particular line for which it was

awarded. It is not, in our opinion, necessary for us to deal in detail with the criticisms which have been made with regard to the manner in which awards have been granted at recent Exhibitions. Justly or unjustly, an impression prevails that they no longer furnish a true criterion of the actual merit of the goods, and there is no doubt that the reluctance with which many have taken part in Exhibitions of recent years is largely due to this fact.

Great trouble and expense involved.

In almost all cases the manufacturers, whose views we have obtained, draw special attention to the trouble and cost which the preparation and display of a creditable exhibit entail under modern conditions. The replies received to the circular enquiry which we issued to manufacturers in different trades show indeed that this is one of the principal considerations by which firms have been influenced in deciding not to exhibit.

Considerable difficulty, it should be borne in mind, is often experienced in following up the advertisement afforded by an Exhibition, owing to the heavy and in many instances prohibitive tariff of the country in which it is held, and, in such cases, the cost of preparing an effective Exhibit is usually out of all proportion to the direct results obtained.

Manufacturers are often too busy to exhibit.

The state of trade during the time immediately preceding an Exhibition also appears to be an important factor with firms in determining whether they shall take part in an Exhibition or not. The preparation of an important exhibit involves the pre-occupation of the principals, the chief manager, the chief scientific director, or other important members of the staff, and it therefore interferes seriously with the current direction and management of a business. Manufacturers who already have a large amount of work on hand are, not unnaturally, reluctant to incur an undue amount of trouble and expense in preparing exhibits which may possibly bring them in little or no direct gain, and in cases where the installation of an exhibit necessitates the constant presence of a skilled assistant it is often impossible for firms to take part in an Exhibition, even if they wish to do so.

Large sums of capital often locked up in unsaleable exhibits.

Again, considerable sums of capital are often locked up for a comparatively long period in exhibits, which, having been specially made for exhibition, are in many instances of a more or less unsaleable nature, and, when trade is brisk, this no doubt constitutes, for firms of limited means, a serious objection to exhibiting.

Danger of being copied.

A further objection to exhibiting which has been frequently advanced by the manufacturers whom we have consulted, is that they are liable to suffer serious disadvantage owing to their goods being copied at Exhibitions by their foreign rivals.

It seems likely that at the earlier Exhibitions a considerable amount of trade was lost to British manufacturers in this manner, and it is probable that in the case of certain classes of goods, and particularly in certain branches of the textile industry, to which we shall presently refer in greater detail, this objection is still of some weight. At the present day, however, we are not disposed to think that there is any greater danger of goods being copied at an Exhibition than there is of their being copied from the specimens which are usually on view in the showrooms of the manufacturers or their agents, or from actual samples which may be purchased on the open market. It must be borne in mind that at the present day the facilities for keeping in touch with new inventions or developments in other countries are very much greater than in the days of earlier Exhibitions, and that the opportunities for obtaining information with regard to new designs or new ideas in any particular branch of trade are by no means confined to Exhibitions. Since the Great Exhibition of London in 1851, at which, it is said, considerable harm was done to British manufacturers through their goods being copied by foreign rivals, many new ways of exploiting invention have been devised. Scientific societies have been established, such for instance as the Iron and Steel Institute, the Institutions of Mechanical and Electrical Engineers, and the Society of Chemical Industries, at which papers are read giving full details of new inventions, or new methods of manufacture, and these papers are widely reproduced in the special trade journals both of this and other countries.

The evidence which we have obtained does not at any rate tend to show that the danger is one which need be seriously taken into account, and it must always be remembered that, if, in some instances, exhibitors have experienced disadvantage through having their goods copied, they, in turn, do not fail to benefit, by themselves inspecting the exhibits of their competitors.

In the case of certain trades, it has been pointed out to us, the result of having goods copied is not necessarily unsatisfactory. Articles and styles are popularised through being made and advertised by a greater number of manufacturers, and the exhibitor, who, at the present day, can rarely hope to monopolise the market, gets the benefit of a larger demand for his goods.

Attitude of different trades towards Exhibitions.

Having briefly reviewed some of the principal objections to Exhibitions which have been put forward by the witnesses whom we have examined, we may now proceed to consider how far they represent the views of the commercial community as a whole—and to what extent they are likely to affect the participation of this country in any future Exhibitions.

One of the most striking facts which has been revealed by our enquiry is the unwillingness of the majority of manufacturers in almost every branch of the textile industries to take part in Exhibitions. Special reasons, to which we shall presently refer, may no doubt be found for the lack of support which is accorded to Exhibitions by the textile industries, but the broad principles by which their attitude on this question is governed will also be found to apply to most of the other great staple industries of this country, and may be explained briefly as follows :

Exhibitions mainly useful in the case of Novelties, Applied Arts, and Specialities of general consumption.

Exhibitions are mainly useful as a means of establishing the reputation of new and unknown firms or in pushing the sale of novelties, or articles which depend for a ready sale upon an attractive appearance as well as upon the actual merits of their composition or wearing qualities. In the case of almost all industries which are generally classed under the heading of applied arts, the productions of which, in order to be appreciated, require to be actually inspected by the customer, there is little doubt that valuable results may be obtained by exhibiting at Great International Exhibitions. Striking novelties or specialities of general consumption may also be advantageously brought to the notice of possible buyers by being displayed at Exhibitions. Products for which there is an extensive, though possibly undeveloped, demand in the neighbourhood of any given Exhibition are also especially benefited by this form of advertisement, and instances are not wanting to show that a valuable trade may often be built up in this manner.

They are generally of little use to the great staple Industries.

As a general rule it may be said that the articles produced by the great staple industries of this country, such for instance as yarns, piece goods, chemicals, and the greater majority of iron and steel goods, do not fall under this category. These industries are for the most part highly organised, and in many cases divided into a number of special trades, each of which performs a separate process in the manufacture of the same article. Thus in the manufacture of woollen goods, the combing, spinning, weaving and dyeing are often carried on in separate establishments, and none of the firms which devote themselves to those processes have any interest in showing their products. Again, the great staple industries have already established their connection in the markets with which they deal and the temporary advertisement afforded by Exhibitions is not of sufficient direct benefit to compensate them for the expense incurred, or for the dislocation of the regular routine of their business which the preparation and display of an effective Exhibit entails. The sources of supply for the goods which these industries produce are, moreover, at the present day well known to buyers in every part of the world, and the industries themselves are so well established that they do not probably benefit by a general advertisement, such as that afforded by an Exhibition, to the same extent as industries which have been founded more recently, and which consequently have more headway to make before they can gain a hold upon the world's markets.

Special reasons in the case of the Textile Industries.

In the case of the textile industries, it must be borne in mind that the bulk of the export trade in this country is in the hands of merchants, and that the manufacturers themselves, as a general rule, have no direct relations with the ultimate consumers of their goods. The demand for certain classes of textiles is, moreover, largely influenced by fashion. Dress goods exhibited in the spring would, in many cases, be out of fashion by the following winter, and if new patterns or designs which had been prepared in advance were exhibited before they were placed on the market, there would be a considerable danger of their being copied in some cheaper material, with the result that the market for those particular goods would be spoilt.

Difficulty of obtaining evidence as to actual sales effected through Exhibitions.

We have already alluded to the difficulty of distinguishing between the direct commercial results which may be obtained as the results of exhibiting by individual firms in the shape of increased orders, and the indirect benefit which they may derive from the general advertisement afforded by an Exhibition. This difficulty is experienced also by the firms themselves, and it is therefore impossible to obtain anything like an accurate return of the actual sales which may be directly attributed to the exhibition of any particular class of goods at a given Exhibition. In the absence of any reliable statistical information upon which to base our conclusions, we are not able to specify with confidence the precise trades which have benefited most by exhibiting at International Exhibitions.

Certain trades appear to obtain direct orders more readily than others.

From the evidence which we have heard, however, it seems probable that except in the case of striking novelties, from the exhibition of which satisfactory returns may be obtained in almost every class of goods, the trades which have derived the most direct benefit from exhibiting are the furniture, china, earthenware, glass, goldsmiths' and silversmiths', jewellers', gun, ammunition and, subject to the reservation in the next paragraph, the machinery and engineering trades. Individual firms have also obtained good results by exhibiting such articles as photographs, special kinds of paper, books and bookbinding, scientific instruments, blotting paper, sanitary fittings, cotton bags, ladies' apparel, electro-plate and cutlery, flexible metallic tubing, brass and copper tubes and metals, preserved food and sauces, biscuits, soap, and silicate of soda. Thus a manufacturer of cotton bags for packing flour, salt, sugar and the like is able to attribute direct increase of business of considerable importance to the fact of his having exhibited his goods at Paris in 1900. A manufacturer in gauge-glasses for showing the water level in boilers states that his firm obtained a large increase of business after exhibiting at Paris, Chicago and St. Louis; and a firm of furniture manufacturers state that they have increased their business with America and Canada threefold as the result of exhibiting their goods at St. Louis in 1904.

In the case of the machinery and engineering trades, the direct results obtained by exhibiting have occasionally been of considerable importance, but this remark, it should be observed, does not apply to specialities for which there is a very limited demand, or to very heavy goods, such as large marine engines, locomotive engines, or certain classes of machine tools. As an example of the benefit which may be derived from exhibiting certain classes of machinery, it may be mentioned that we were informed by one firm of engineers and merchants that they had themselves purchased and sold one hundred metal shaping machines as the result of having seen them at the Liège Exhibition, 1905, and that they had also seen at the Gas Exhibition at Olympia, two years ago, a tube-bending machine, of which they had since purchased and sold fifty. The same firm states that at the Engineering Exhibition in Newcastle in 1893 their attention was drawn to an exhibit by a firm with whom they had not previously done business, and that as a result they had made large purchases from that firm.

Numerous examples might be quoted, but enough has perhaps been said to show that direct results of considerable importance may be obtained by the exhibition of goods of widely different natures, and that if there are many trades to which Exhibitions are of little direct value, there are a number of others which may benefit materially thereby.

Direct results largely dependent on employment of capable agent.

To a large extent, it would appear, the amount of direct benefit which may be derived from exhibiting by any particular firm is dependent on whether that firm is represented at the Exhibition by an efficient agent. In many cases, it is said, the attendants in charge of the stalls at an Exhibition are unable to describe the goods exhibited in a correct or intelligible manner, and in others their technical knowledge is often thrown away owing to their inability to speak any language but their own. The point is one to which far greater attention appears to have been paid by foreign than by British exhibitors, and we cannot but think that if all exhibitors were able to keep an active and capable representative in constant attendance at their respective stands during the Exhibition the amount of direct business done might be largely increased.

B.—The Indirect Effect of Exhibitions on Trade.

Indirect advantages of Exhibitions.

Turning now to the question of the indirect advantages of Exhibitions, as opposed to that of direct pecuniary gain resulting from increased orders, we find that the evidence as a whole is strongly in favour of the continued participation of this country in all really important Exhibitions.

Advertising a necessity for the individual and for the nation.

Even those trades which as a whole are most unwilling to take part in Exhibitions themselves, are of opinion that the manufactures and arts of this country should be well represented at all really great Exhibitions, and a number of firms who from the nature of their exhibits can expect little or no direct return to compensate them for their outlay, still continue to exhibit at fairly frequent intervals. In doing this many have no doubt been influenced by the fear that they might lose their place in the trade if they failed to be represented at exhibitions when their competitors were showing; but there are on the other hand not a few who regard their expenditure on Exhibitions in the light of a necessary item in their general scheme of advertisement, and who spend a thousand or five hundred pounds upon an exhibit at Paris or St. Louis in the same way as they would upon hoardings or upon advertising in the papers. It must, however, be recognised that the exhibitors who are actuated by the former motive are probably the more numerous, and that it is in the necessity of keeping pace with foreign competitors that the chief argument is to be found in favour of the continued participation of Great Britain in all important Exhibitions. In our opinion, the same causes which render it necessary for invidual firms to spend large sums of money on advertisements in order to maintain their position in a particular trade, also render it imperative that every effort should be made at the present day to maintain and improve the reputation of British manufactures as a whole. Experience has shown that even in the case of firms with an established reputation and world-wide connections, attempts to discontinue advertising have usually been followed by a diminution in the sales effected, and we cannot but think that the neglect by Great Britain of one of the most important forms of national advertisement would be equally detrimental to her interests as a manufacturing country.

This idea of a national advertisement appears to direct attention to a special form of exhibit, the value of which has been specially commended to our notice in the course of our inquiry, viz., a collective exhibit of the trade of particular districts of the United Kingdom, which may thus react not only on the whole trade of the particular district but also (especially when the exhibits cover several districts) on the general trade of the country at large. A collection of Manchester goods or Bradford goods or of ironware from Wolverhampton, when carefully selected on collective lines from all the best manufacturers within those districts, may give an object-lesson of the trade of that particular district which cannot possibly be otherwise obtained, and it has been suggested to us that such an object-lesson has more effect than anything else in attracting orders from other countries to the area of the industry so represented.

Exhibitions stimulate invention and promote knowledge.

Another aspect of Exhibitions to which we think considerable importance should be attached is the effect which they have in encouraging national emulation and in stimulating individual Exhibitors to improve their productions. Several witnesses, indeed, whom we have heard are of opinion that it is in the opportunity which Exhibitions afford to individual manufacturers of comparing their productions with those of other countries that the chief value of Exhibitions lies. It is probable that the mere fact of preparing an exhibit which is to compete with the productions of rival manufacturers from all parts of the world is of itself of considerable value in stimulating invention and raising the standard of work on the part of those responsible for it, but we think that even greater benefit is often derived by the subsequent comparison of results at the Exhibition itself. In this manner the individual manufacturer is able to ascertain whether he is improving his position, merely maintaining his ground, or being displaced by his rivals. New light may often be thrown upon his work by inspecting the methods employed in other countries, and the ideas thus gained may eventually be of importance to the development of the industry in which he is engaged.

Instances in which industries have benefited by knowledge gained at Exhibitions.

Interesting examples of the effects which particular Exhibitions have had on the development of different industries will be found in the evidence of Sir William Preece, K.C.B., Mr. Bennett Brough, and other witnesses, which is given in the Appendix to this Report. It is, in the opinion of Sir William Preece, to Exhibitions

and in particular to the Paris Exhibition of 1881, that many of the most important developments of the electrical industry may be attributed, including several improvements adopted by the Telegraph Department of H.M. Post Office. The exhibition at Paris of certain high-speed tool steel by an American firm is said by Mr. Bennett Brough to have contributed in a large degree to the development of what has since become a British industry of great magnitude, and an Exhibit by the Courrières Colliery Company, at whose mines the death-rate from falls of the roof was abnormally low, has since led to considerable improvement in the methods of timbering employed by the colliery managers in this country, and to a consequent decrease in the death-rate from accidents of this nature.

Exhibitions are also of general educational value.

Exhibitions are also of considerable educational value apart from the opportunities which they afford to individual manufacturers for inspecting goods of a particular class. Exhibits illustrative of Education, Social Economy, Geography, Exploration and the like are almost invariably included in the Sections of all the participating countries, and afford valuable information as to the progress of other nations.

It is said that much of the progress which has been made in the technical and industrial education both of our own and other nations is attributable to Exhibitions, and evidence is not wanting to show that this fact is fully appreciated by the Governments of other countries. In the case of France and Germany one of the objects to which grants of Government money have been devoted is the despatch of workmen's missions to study the progress made by foreign countries in various branches of industry. Similar arrangements, it is understood, are also made by other countries, but no such missions appear to have been officially organised by H.M. Government.

In the case of the Paris Exhibitions of 1867 and 1878, an organisation was formed by the Society of Arts for the purpose of facilitating visits of artizans to the Exhibitions, and interesting reports on the results of these visits were subsequently published by that body. No assistance, however, appears to have been given to these undertakings from the official grants at the disposal of the Royal Commissioners for either of those Exhibitions.

Political considerations.

Finally, the political considerations which attach to any particular Exhibition may often be more potent than anything else in determining the action of the British Government in participating in an Exhibition. We would refer to the evidence of Sir Henry Austin Lee, where he observes that if there were another Exhibition in Paris at the present moment it would be practically impossible for the British nation not to take a leading part in it. Moreover, the mere mingling of nations in a great World's Fair may have an untold effect upon the future relations of the countries of the world. People see something of one another; they understand better one another's methods; they interchange ideas. A strong opinion was indicated in a great deal of the evidence that came before us, that even if there were no commercial value, and if there were no educational value to be derived from Exhibitions, the political considerations involved would very often of themselves justify an expenditure of public money

C.—The Effect of Exhibitions upon Art.

Having dealt in some detail with the direct and indirect effect of exhibition upon British trade, we may now refer briefly to the manner in which British art has been affected by the participation of this country in great International Exhibitions.

As regards the direct commercial benefit accruing to artists from the exhibition of their works, it should be observed that, before the Brussels Exhibition of 1897, British Art Sections usually consisted of works of art which were largely borrowed from private owners. These "loan collections" were consequently of little direct benefit to the artists except in the matter of awards.

Since the Brussels Exhibition of 1897, however, the tendency has been to make the British Art Section, as far as possible, representative of the time, and in recent years an increasing number* of works of art has been exhibited by the artists themselves. Prior to the St. Louis Exhibition of 1904, hardly any sales appear to have been effected in the British Art Sections, but at St. Louis the sales of British works of art realized the sum of £7,000, and at the exhibition at Christchurch in New Zealand, recently closed, they realized £17,000. These figures are interesting as illustrating the opportunity which exhibitions afford to artists, under favourable conditions, of disposing of their works.

It should be borne in mind that there was at one time an undoubted tendency on the part of foreign critics to underestimate the value of the work of modern British artists. Evidence is however not wanting to show that of late years there has been a growing appreciation of British art in foreign countries, and this result, it is said, is largely due to the excellence of the display which has been made in British Art Sections at recent exhibitions. As a result of these displays commissions have occasionally been obtained by British artists and their works have been acquired for the picture galleries of the Luxembourg at Paris, and for the galleries of Berlin, Düsseldorf, Munich and other places.

It is not only in the productions which are usually classed under the heading of pure art that Great Britain has of late years advanced her position in the eyes of the world. The applied art of this country as represented by the whole range of craftsmanship, and the artistic designs displayed in the potteries, furniture and metal work that have been exhibited in the British sections of the various International Exhibitions have not only won the highest diplomas, but have received the warm commendations of foreign critics.

As in the case of manufactures, however, it is impossible to gauge the success or failure of any given exhibit merely by the value of the sales effected. The new reputations made, the prejudices removed, and the lessons that have been taught and learnt have also to be taken into account.

The educational advantages afforded to the artists and to the public by an international display of this character are obviously of great importance, and it is probable that the indirect gain resulting therefrom far outweighs the direct value of the orders obtained.

At the present day, even art cannot be wholly freed from the necessity for advertisement, and there is little doubt that, for all objects which require to be seen by the purchaser in order to be appreciated, there are few forms of advertisement which can be more advantageously employed than exhibiting at great International Exhibitions.

It must be remembered that the Art Section is always one of the principal attractions at an exhibition, and that its success or failure has an important influence on the results obtained by the British Section as a whole.

It is generally admitted that the British Art Sections at the Brussels Exhibition in 1897, at Paris in 1900, and at St. Louis in 1904 were superior in artistic merit to those of other foreign countries, and from the evidence which we have heard as to the effect which these displays produced upon the minds of visitors to the exhibitions, we think that it is of the greatest importance to the success of British Sections in future that this excellence should be maintained.

D.—General Conclusions to Part I.

It will be seen, from the brief review which we have given under the three broad headings into which this section of our Report is divided, that no definite statement of general application can be made as to the nature and extent of the benefit accruing to British arts and industries as a whole from the participation of this country in great International Exhibitions.

---

* Note.—The number of artists who sent works to the Brussels Exhibition in 1897 was 259. At Paris in 1900 there were 282, and at St. Louis in 1904 there were 501. No less than 511 artists were represented by their own works at the Christchurch Exhibition in New Zealand which has just been closed.

If we regard Exhibitions solely as a means of directly increasing the trade of ndividuals, there are serious objections to the expenditure on this object of large sums of money from public funds.

The evidence with which we have dealt under Section A of the foregoing summary shows that there is considerable conflict of opinion as to the benefits of exhibiting from this point of view, and that while there are some trades which probably derive great advantage from the support afforded by the official participation of H.M. Government in great International Exhibitions, there are many others of equal importance which derive no benefit whatever.

On the other hand, it has been shown that there are several considerations other than that of the direct pecuniary gain to individuals which have to be taken into account before it is possible to decide how far the official participation of this country has been justified by the results obtained. These considerations, which involve the general benefit of the country as a whole, point to the conclusion that the expenditure of public money on Exhibitions has not been without warrant, and that it cannot be discontinued.

The extent of the benefit resulting to any particular industry from the display of its manufactures at Exhibitions cannot be measured by the amount of direct orders received by individual exhibitors, nor can the value of the instruction which may be derived from an international competition of this nature be estimated in terms of pounds, shillings and pence. Even though the official participation of this country in great Exhibitions may not at first sight appear to bear direct results commensurate with the expenditure involved, it is probable that value for the money is ultimately obtained through the indirect advantages to which we have alluded.

To a large extent the question which we have to decide is not whether it pays to exhibit, but whether under modern conditions we can afford not to exhibit. We think that the evidence which we have obtained affords convincing proof that the answer to this question is in the negative.

The question as to how far the prosperity of this and other countries might be affected if Exhibitions were abolished altogether does not seem to us to be one which we can profitably discuss. There are, no doubt, a number of manufacturers who would be glad to be spared the trouble and expense of exhibiting if they could be sure that their competitors would also refrain from taking part in Exhibitions, and the interesting reports on the participation of other countries in Great International Exhibitions, which we print as an Appendix on pp. 29–64, show that this feeling is not confined to Exhibitors in this country. It will be seen from the Report by Sir Francis Oppenheimer, H.M. Consul-General at Frankfort, in particular, that there is a considerable feeling of disappointment among German Exhibitors with the results which have been obtained by the participation of Germany at recent Exhibitions, and there is also evidence of a similar attitude with regard to Exhibitions on the part of manufacturers in Austria and Switzerland. On the other hand it would seem from the information furnished by H.M. Commercial Attachés at Berlin, and from the reports of H.M. Representatives in certain other countries, notably in France, the United States of America, Belgium, and Japan that a high opinion of the value of Exhibitions as a means of promoting industrial development is held by the majority of Foreign Governments, and there is therefore little likelihood of anything in the nature of a general withdrawal from Exhibitions on the part of other countries. We are on the whole disposed to think that the view which has hitherto been taken with regard to Exhibitions by the majority of Foreign Governments is correct, and that even though the immediate results may in some instances be disappointing, the systematic and complete representation of a nation's industries at great International Exhibitions cannot fail to be ultimately of material advantage to the commercial development of that country.

Whatever may be the view taken on this question, however, there seems little doubt as to the part which is likely to be played in all future Exhibitions by the principal commercial competitors of this country. At all recent Exhibitions the displays made by France, Germany, and other foreign countries have been of increasing importance, and so long as this policy is continued, the representation of British arts and industries at the more important Exhibitions will remain a national necessity.

In this connection, however, we desire to point out that little, if any, advantage can be expected to be derived from Exhibitions at which this country is inadequately represented. There can be no profit either to the individual or to the nation as a whole in displaying inferior British exhibits by the side of the best productions of our commercial competitors, and the views which we have expressed as to the necessity for the representation of British arts and industries at great International Exhibitions must, therefore, be regarded as being conditional upon such representation being effective and complete.

In the next section of our Report we shall consider how far this condition has been fulfilled in the case of Exhibitions in which Great Britain has taken part in the past.

PART II.—PARTICIPATION OF GREAT BRITAIN IN PAST EXHIBITIONS.

A.—Grants made by H.M. Government.

The first International Exhibition abroad at which H.M. Government was officially represented, and for which a grant was made from the public funds, was held at New York in the year 1853. This Exhibition does not appear to have been of any considerable importance, and no information appears to be available which would show the grounds on which it was thought desirable that this country should participate in it.

Since that date, H.M. Government has been officially represented at no less than twenty-two Exhibitions which have been held either in foreign countries or in British Colonies, and has incurred a total expenditure of approximately £640,000 on this account during the last fifty-two years.

Several of these Exhibitions were of comparatively small importance, and the expenditure on some of them, such, for instance, as those at Antwerp in 1885 and 1894, appears to have been confined solely to the provision of a small allowance for the Consul in whose district the Exhibition was held.

In the case of other Exhibitions of somewhat greater importance, such, for instance, as those at Brussels in 1897 and at Milan in 1906, the formation of the British section was undertaken by a Committee which owed its origin to the initiative of the London Chamber of Commerce, and though the work of the Committee was assisted by grants of public money, no active part was taken in the organization of the British section by H.M. Government.

In other cases the task of organising the British Section was entrusted to a Government Department (*e.g.* the Science and Art Department) or to a Committee of Government Departments.

In the case of the more important Exhibitions, however, at which this country has been officially represented, the formation of the British section has usually been in the hands of a Royal Commission appointed temporarily for the purpose, and it is therefore with the success or failure of the British Sections at these Exhibitions that we are principally concerned.

A complete list of the Exhibitions in which Great Britain has participated officially, showing the expenditure incurred in each case by H.M. Government, will be found in the Appendix to this Report.

B.—General Review of Past Management.

Lack of definite policy with regard to Exhibitions.

The evidence obtainable with regard to the organization of the British sections at most of the Exhibitions in which this country has taken part, is for the most part of a very vague and uncertain nature. The information contained in the Official Reports is often incomplete, and it is difficult to form from them any clear idea as to the manner in which the grants were expended and the exhibits organized.

This lack of precision would appear to be due principally to the fact that the participation of this country in great International Exhibitions has never been governed by any continuous or clearly defined principles. In most cases, it would appear, the consent of H.M. Government to take part in Exhibitions has been based upon political motives, rather than upon any definite ideas as to the utility of the undertaking from the point of view of British trade. No continuous system has hitherto been adopted for the organization of British Exhibits at such Exhibitions, and no attempt seems to have been made to apply to one Exhibition the lessons derived from the success or failure of another.

In the Official Reports of most of the earlier Exhibitions, the expenditure is generally classed under a few broad headings of a very comprehensive nature, and it is difficult, in the absence of a more detailed analysis of the payments, to state in what manner or to what extent exhibitors were assisted from the grants at the disposal of the Organizing Body.

British participation mainly dependent on voluntary effort.

As a general rule, however, it may be said, that the assistance afforded by the Government to British Exhibitors has been confined to the provision of an organization which would enable them to display their goods if they desired to do so at their own expense. With but very few exceptions, the whole cost of the preparation, transport, insurance, installation, and decoration of the exhibits appears to have been borne by the exhibitors themselves, and few inducements were offered by the Organizing Body with a view to securing the co-operation of firms who were unwilling to exhibit for their own personal profit.

In this respect there is a very marked difference between the policy of Great Britain and that of other countries.

In the great majority of foreign countries, the formation of the national exhibit has usually been undertaken directly by the Government as part of a clearly defined national policy, having for its object the systematic and complete representation of the arts and industries of the country. The Government, it may be said, renders itself responsible for the credit and reputation of the nation, and liberal inducements are offered to manufacturers to ensure that the country shall be represented by its best productions.

The representation of the British industries at Exhibitions, on the other hand, has generally been mainly dependent upon the voluntary effort of individuals, and no sustained attempt appears to have been made to secure a really comprehensive display of the principal manufactures of the country at successive Exhibitions.

No Department permanently responsible for Exhibition work.

To a large extent this would appear to be due to the system, which has hitherto been followed, of appointing a different Commission to deal with each Exhibition, and to the fact that no one Department or other authority has been permanently responsible for the work of organization. No machinery, other than a general exchange of views between the Treasury, the Foreign Office, the Colonial Office and the Board of Trade, has hitherto existed for determining whether the participation of Great Britain in any given Exhibition is desirable or the reverse, and the decision to participate has therefore usually been taken without any organised attempt being made to ascertain the nature or extent of the support which was likely to be accorded to the undertaking by manufacturers in different trades.

Delay in appointing Royal Commissions.

Owing to the absence of any permanent authority to advise upon such matters, considerable delay has usually taken place in appointing a Royal Commission. Much valuable time that might have been devoted to the preliminary work of organization has been wasted before a decision has been arrived at as to who shall undertake the work, and the exhibits of many manufacturers who would have been willing to take part in the Exhibition if they had been approached at a sufficiently early date, have thus been lost to the British section. In the same way considerable delay has often taken place in approaching the authorities of the Exhibition with regard to the allotment of space for the British section. Even when the Commission is finally appointed it is often found that, owing to the lack of preliminary investigations, no definite estimate can at once be made as to the amount of space which is likely to be required, and the negotiations with the Exhibition authorities are thus conducted at considerable disadvantage. By the time that the final application for space has been made, it is not infrequently found that the best positions in the Exhibition have already been allotted to other countries. The British Commissioners have no alternative but to

accept what they can get, and the British section, or at least many important parts of it, are relegated to an obscure and often unattractive portion of the Exhibition.

No continuity between one Commission and another.

One of the most striking facts revealed by an examination of the Official Reports of the Royal Commissions, which have acted on behalf of this country in the past, is the absence of continuity by which their work has been characterised. The participation of Great Britain in each successive Exhibition would appear to have been treated as if it were an entirely new problem, unconnected with those that had gone before, and little, if any, attempt seems to have been made to apply to one Exhibition the lessons derived from another.

To a large extent this has been due to the fact that there has been no Department responsible for preserving the records of successive Commissions. When the work of a Commission is wound up, all the information which it has collected is lost. Lists of manufacturers, forms, labels and books of reference, which would be of inestimable value to succeeding Commissions, are either destroyed or dispersed among the libraries of various public departments. The work of organisation has therefore been begun anew by each Commission, in comparative ignorance of the methods adopted by its predecessors. Information may, it is true, be got together by dint of laborious researches at the British Museum, at the South Kensington Museum, at the Record Office or other departments, but by the time this is done much valuable time has been lost, and it is often too late to profit by the instruction which might have been derived from it if available at the outset.

No continuity in appointment of Executive Officers

The same lack of continuity that has characterised the appointment of Royal Commissions in the past is also noticeable in the selection of the executive officers. In the case of all the more important Exhibitions in which this country has taken part, the greater part of the active work of organization has been performed by the Secretary to the Royal Commission. This officer has, in most cases, acted as the Commissioner-General at the Exhibition itself, and upon the completion of all the preliminary work of collecting, classifying and despatching the exhibits from this country, has usually taken charge of the work of installation, decoration, and general management of the British section. The work which he is called upon to perform is work of a highly specialised nature, requiring not only energy and application, but careful training and previous experience. It is of course, in theory, the Royal Commission which is ultimately responsible for the organization of the British section. In practice, however, its functions are to a large extent of an advisory nature, and though much useful work is undoubtedly performed by the more active of its members, in enlisting the support of exhibitors and in settling generally the broad principles upon which the British section shall be managed, it is the Secretary and Commissioner-General who superintends all the practical work of organization. It is, in fact, mainly upon this one officer that the success or failure of the national display as a whole depends. In these circumstances it is not a little surprising to find that in no two of the more important Exhibitions in which this country has taken part since 1878 has the post of Secretary and Commissioner-General been filled by the same man.

It is not within our province to criticise the work which has been performed by the individual officers who have held that post in the past. Having regard to the disabilities under which they were placed, owing to their lack of experience and the absence of continuity with previous Exhibitions, we consider that their work has as a rule been admirably performed, but we feel it necessary to deal in some detail with the criticisms which have been made by the witnesses whom we have examined, upon the administration of British sections at certain of the more recent Exhibitions. We desire, however, to point out that our observations in this connection are not in any way intended to reflect upon the energy and zeal of the officers primarily responsible for their management, but upon the system which has rendered it necessary for them to carry out their work under such manifest disadvantages.

Great Britain inadequately represented at past Exhibitions

From the evidence which we have heard, there appears to be little doubt that, taken as a whole, the British sections at all the more recent Exhibitions have not afforded an adequate and satisfactory representation of the nation's industries. With the exception of the Art Exhibits, which at recent Exhibitions have undoubtedly attained a high degree of excellence, the goods exhibited in the British sections would appear to have been of very uneven quality. Many of the more important industries of this country, if represented at all, were represented by firms of minor importance. The exhibits of many of these firms were often creditable to themselves, but it cannot be said that they were representative of the best productions of the country or that they compared as a whole favourably with the exhibits of other countries.

Failure to secure the best firms.

It is felt by many manufacturers that insufficient attention has been paid by Royal Commissions in the past to the question as to which firms were in a position to furnish creditable and representative exhibits and which were not. No system of selection, such as that which prevails in many foreign countries, has been adopted with a view to ensuring that only the best examples in every department of industry shall be represented at the Exhibition, and except in a few notable instances no sustained attempt appears to have been made to secure a complete and effective display of each individual trade as a whole. In many foreign countries this object is usually attained by the formation of collective exhibits for each industry or branch of industry. By this means a complete collection of the best and most representative specimens is made for each class of manufactures, the goods are then carefully arranged and harmoniously grouped together in the form of a single exhibit illustrative of the trade to which they belong. In this manner a symmetrical appearance is obtained, space is saved, and duplication of exhibits is avoided.

Collective Exhibits.

Except in the case of the St. Louis Exhibition, this system has never been tried on an extensive scale in this country. Attempts have from time to time been made to form collective exhibits of this nature, but they have usually been abandoned owing, it is said, to the difficulty of inducing British manufacturers to enter into any form of combination or to submit to any restriction of their independence. As an illustration of this contention, it will perhaps be useful to quote the following passage from the Report of the Royal Commission for the International Exhibition which was held at Paris in the year 1900.

"As a rule, a British manufacturer will only exhibit if he can select his own goods, and display them in his own way and in his own show case. He is impatient of advice; he will not submit to dictation; he will not share a show case with others; nor will he join with others to adopt a uniform plan of arrangement. In many instances he regards his exhibit as of much more importance as an advertisement and a competition with rivals at home than as a comparison of his productions with those of other countries. For these reasons it is exceedingly difficult to organise collective exhibits. We were strongly impressed from the beginning with the advantages which such exhibits possess. They save space: they avoid the duplication of similar objects, and in the case of many industries they ensure a higher level of excellence than any single firm can hope to obtain. We endeavoured to persuade exhibitors to adopt the principle, but our efforts met with so little success that we had to abandon the attempt. In the few instances in which our recommendations were accepted—notably by the Bradford and Huddersfield Chambers of Commerce, the Alkali Manufacturers Association, the Redditch manufacturers of needles and fish-hooks, and others—the result amply justified our expectations; but, with few exceptions, the objection to combination, arising out of trade rivalry, proved too strong, and the experiment was tried on too limited a scale to have an appreciable effect on the section as a whole. We are none the less convinced that the best hope for the future lies in this direction, and that well-organised collective exhibits formed, perhaps, under the aupices of local municipalities or chambers of commerce, coupled with symmetrical arrangement, would afford the best means of displaying British industries in their true proportion. It is, however, essential that the preparation of such exhibits should be begun in ample time, and one of the difficulties of the task lies in prevailing upon men of business to consider the subject and take the necessary steps two years or more in advance."

It is probably true that the tendency of British manufacturers is towards individualism rather than collectivism in such matters, and that considerable difficulty is experienced in obtaining collective displays from many branches of industry.

In our opinion, however, the difficulty is not one which need be regarded as insuperable. To a large extent the success or failure of such attempts would appear to be dependent upon the amount of personal effort made by the organizing body and upon the degree of influence which individual members of that body possess with the trades in question. In this connection we desire to draw especial attention to the evidence relating to the formation of the Collective Chemical Exhibit at the St. Louis Exhibition which will be found in the Appendix to this report. In this case, four gentlemen acting as a sub-committee of the Royal Commission, formed a collective exhibit which has since been universally admitted to have been one of the finest displays which has ever been made by any country at any Exhibition. We have heard evidence from manufacturers who took part in that exhibit, and we think that there is little doubt that its success was due almost wholly to the personal efforts of the gentlemen by whom it was organized. We are unable, upon the evidence before us, to see any reason why similar success should not be achieved in the case of other industries.

It is of course essential that the Organizing Committee should be not only well acquainted with the industries to be represented, but also should have full knowledge of the firms engaged in those industries, and it is therefore necessary that careful attention should in the first instance be paid to the selection of men who are both able and willing to perform the work properly.

Inadequate organization for obtaining Exhibitors.

To some extent, no doubt, the inferiority of the British Exhibits as compared with those of certain foreign countries, is due to the fact that in Great Britain, little

if any direct pecuniary aid is given to the exhibitors by H.M. Government, whereas in many foreign countries a large proportion of the expenses which participation in an Exhibition involves is borne by the Government.

To a far greater extent, however, we think, the question is one of organization. The evidence of manufacturers in this country shows that, in many cases at least, the steps which were taken by the Organizing Body to obtain their co-operation were of a somewhat perfunctory nature. It is said that little information of practical use was contained in the circulars inviting them to exhibit, and that even after application for space had been made to the Royal Commission, considerable difficulty was experienced in obtaining particulars as to its probable cost, position, lighting, surroundings, &c.

In this connection we desire to point out that satisfactory results are rarely obtained by the issue of a circular invitation to exhibitors unless that step is followed up by active canvassing. How much can be accomplished by careful organization is shown by the case of the chemical exhibit at St. Louis, to which we have just referred. We cannot but think that if guidance were sought from the methods adopted by the organizers of that exhibit, a far better and more complete representation of the nation's industries might be obtained.

Inadequate Space for the British Section.

We have already alluded in a preceding paragraph to the delay which has usually taken place in appointing Royal Commissions in the past, and to the consequent disadvantage at which they were placed in negotiating for space with the Exhibition Authorities. It has been pointed out that in this manner the space allotted to the British section has often been inadequate and badly placed. The question is one to which our attention has been repeatedly drawn by the witnesses whose evidence we have heard. In some cases intending exhibitors have had no knowledge, until their goods were actually ready to be shipped, of the amount of space they were likely to obtain. The exhibits of important industries have eventually had to be placed in out-of-the-way positions, and in others they have been so crowded together that the individual exhibits failed to attract the proper amount of attention, if, indeed, they were not overlooked altogether.

Increased cost of Insurance owing to delay.

It should also be pointed out that, owing to the late date at which the organization of British sections has been begun, the cost of insuring the exhibits has been materially increased. By the time that British exhibitors are in a position to negotiate for the insurance of their goods, large risks have already been accepted by many of the insurance companies on the goods of exhibitors in other countries, and the rates of premium have consequently risen.

Except in the case of the St. Louis Exhibition, practically the whole of the cost of exhibiting, including insurance, has been borne by the exhibitors themselves. Large sums have, however, been spent out of Government grants in the past for the insurance of the Fine Art Section, and it is probable that a considerable saving might be effected under this heading, if the Royal Commission or other Organizing Body were in a position to effect the insurance at an earlier date.

Difficulties of Installation.

A further point upon which criticisms have been made in connection with the organization of British sections at International Exhibitions in the past, is that of the difficulty which has been experienced by exhibitors in installing their exhibits on the space assigned to them. Owing to the unusual demand for labour which is created by the inauguration of a great exhibition, considerable difficulty is experienced in obtaining capable workmen to assist in the erection of the exhibits. In many cases exhibits of a highly intricate and delicate nature have to be set up by workmen, who have had no previous experience of the goods, and who are unable to understand the instructions given to them. At such times, it is pointed out, exorbitant charges are made both for materials and labour, and the installation of the exhibits is consequently attended with very heavy expense.

A lack of organization in the arrangements for the delivery of the goods in the exhibition buildings has also been a source of difficulty. Goods intended for one section of the building are frequently delivered in another, often at a considerable distance from their destination, and in the absence of an adequate supply of labour, considerable delay is entailed in getting them into their proper position.

To some extent no doubt such difficulties are unavoidable during the initial stages of an exhibition, and no amount of foresight would probably suffice to prevent their occurrence in individual cases. There appears however to be a very general feeling among British exhibitors that they were usually at a greater disadvantage in this respect than exhibitors of other nationalities, and that

greater facilities might have been obtained for them by the organisers of the British section.

It has been suggested to us by some of the witnesses whom we have examined, that in the matter of installation the object which the British Commission might properly seek to attain, should be to provide the requisite amount of labour and other necessary facilities to exhibitors at cost price.

It is said that in the case of certain of the foreign sections at recent exhibitions, practically the whole of the work of installation was carried out by workmen who were specially sent there for the purpose by the Government of the country from which the exhibits came. All the necessary materials were taken with them, and the work was therefore carried out in complete independence of the local contractors and workmen.

It is thought that if arrangements could be made on these lines by the organisers of the British section, the trouble of exhibiting would be materially diminished, and that a considerable saving of money would be effected.

Lack of uniformity in grouping and decoration.

Another important point to which our attention has been directed by most of the witnesses whom we have examined, is the lack of any uniform system of grouping and decorating the British exhibits, so as to secure a harmonious and attractive appearance of the section as a whole. In this respect it is generally admitted that British sections at most recent Exhibitions have compared very unfavourably with those of other countries. In the latter, as a rule, the exhibits are arranged by the Government organization in such a manner as to form a complete national exhibit of a striking and decorative character. The show cases are usually of a uniform pattern, and a general scheme of decoration is adhered to for the whole of the exhibits. In the British sections, on the other hand, no considered plan would as a rule appear to have been adopted in allotting the space to exhibitors of different classes of goods. Artistic pottery has been exhibited side by side with trouser stretchers, scientific instruments have been placed next to the exhibit of a theatrical wig-maker, and glassware of a highly decorative character has been surrounded by pyramids of empty bottles and syphons. In this manner the uneven quality of many of the exhibits has been accentuated and the general effect of the section spoilt.

The decoration of the exhibits, moreover, appears to have been left almost entirely to the exhibitors themselves. Each exhibitor has provided his own show case and has decorated his stand in the manner that pleased him best.

To a large extent no doubt the same causes which render it difficult to induce manufacturers to take part in a collective exhibit, also render it difficult to arrange for a uniform and systematic scheme of grouping and decorating individual exhibits. We think, however, that, if sufficient trouble were taken to acquaint exhibitors beforehand with the nature of the arrangement and decoration proposed, much might be done to reconcile conflicting interests, and a far greater degree of uniformity might be attained.

Royal Pavilions.

One of the principal features of the British sections at the more important International Exhibitions in which H.M. Government has taken part, has been the Royal Pavilion, or headquarters of the Commissioner-General. It is in this building that the offices of the executive staff are usually located, and that official entertainments to the representatives of the foreign governments and to the exhibition authorities are held.

In the case of the Paris Exhibition of 1900 the Royal Pavilion was a copy of an old Jacobean house at Bradford-on-Avon, and at St. Louis it was a reproduction of the Orangery of the Royal Palace of Kensington, which was built by Sir Christopher Wren at the beginning of the eighteenth century.

There is no doubt that these buildings, which were most artistically decorated and furnished, formed a very important and striking feature of the British section. At the same time the reports of the Royal Commission for those Exhibitions, show that a very large proportion of the official grant was spent upon this one item, and the question may not unnaturally be asked whether the expenditure was justified by the results obtained.

After careful consideration of the evidence before us we are disposed to think that a portion at least of the cost* of these buildings might more usefully have been

* The cost of the Royal Pavilion at the Paris Exhibition was about £23,000, and in the case of the St. Louis Exhibition no less a sum than £31,829 was spent upon the Pavilion and the gardens by which it was surrounded. At the close of the Exhibition the buildings were sold, in the first case to the contractor by whom they were put up, and in the second to the St. Louis University. In neither instance, however, did they realise more than about £200.

spent in the provision of additional facilities for exhibitors, in the formation of collective exhibits, or in some more directly remunerative manner. While fully appreciating the value of such buildings, both from an educational point of view, and also as a form of national advertisement, we think that the expenditure incurred on them was probably greater than was actually necessary, and that equally satisfactory results might have been obtained by the erection of attractive and striking buildings of a far less substantial and expensive character.

General Management and Supervision of Exhibits.

A considerable amount of criticism has also been directed during the course of our enquiry to the general management and supervision of Britith sections. The views of witnesses are necessarily somewhat diverse on this question, according as individual exhibitors were fortunate or the reverse in regard to such matters as the allotment of space, the position of their exhibit, awards and other matters of a like nature. There seems, however, to be a very general feeling that the executive officers to whom the management of British sections has been entrusted in the past, have to some extent failed to get into proper touch with the exhibitors, or to appreciate their grievances. It should be borne in mind, that owing to differences of language and custom, the difficulties of the exhibitor in a strange land are often considerable. They are especially so in the case of exhibitors who have had no previous experience of the country. The regulations of the exhibition authorities often appear unnecessarily strict and vexatious to persons who have no knowledge of the difficulties with which the administration and control of a great exhibition are attended. It may happen that these regulations are not always uniformly enforced, and the feeling of resentment which they provoke is not unnaturally accentuated when the officials to whom the interests of British exhibitors are entrusted are less successful than the representatives of other countries in securing their relaxation. It has been said that responsible members of the British staff have not been personally accessible to exhibitors who have found themselves in difficulty, and instances have been quoted in which facilities, which exhibitors were unable to obtain from the headquarters of the British section, have subsequently been obtained by direct application to the exhibition authorities or by the aid of the officials in charge of foreign sections.

There is of course a not unnatural tendency on the part of exhibitors to magnify the gravity of their personal grievances. They are perhaps unduly inclined to attribute to lack of organization difficulties which were in fact either accidental or unavoidable. At the same time it must be admitted on reviewing the evidence which we have heard that the organization of the British sections at most of the great Exhibitions of recent years has not worked as smoothly as could be desired. When, however, we take into consideration the lack of continuity and the entire absence of system by which British participation in International Exhibitions has been characterized hitherto, we cannot but wonder that it has worked as well as it has.

C.—Comparison with Foreign Methods.

It may perhaps now be useful to describe briefly the methods adopted by some of the principal foreign countries for the organization of their exhibits at great International Exhibitions.

Broadly speaking, the methods of organization employed by the majority of foreign countries are based upon one of two distinct systems. Each of these two systems is of course subject to modification as regards matters of detail in different countries,* but for the purpose of this Report it will be sufficient to describe briefly their general characteristics and essential differences.

The first system to which we shall refer is one which would appear to have reached its highest state of development in France. The principal feature of this system is that practically the whole of the work of organisation is performed by a Committee of the exhibitors themselves. At the more important exhibitions at which the French Government is officially represented, this Committee is nominally under the control of a Commissioner-General appointed by the Ministry of Commerce. All the active work of preliminary investigation and organising the exhibits is, however, undertaken by the Committee, and practically the whole of the cost of the French section, with the exception of exhibits of an unremunerative nature, such as Education, Art, Social Economy and the like, is borne by them.

*Note.—Further particulars relating to the methods adopted by other countries will be found in the Reports by H.M. Representatives abroad, which are published in Appendix C.

The Committee, of which the full official title is the *Comite Français des Expositions à l'Etranger*, was established about twenty years ago, and was officially recognised by the French Government as an "*établissement d'utilité publique*" in 1901. The Committee has now about 2,200 members. It is open only to manufacturers who have obtained a high award at an exhibition, or who have acted as members of a jury at an exhibition or of an exhibition committee. The Committee acts in the interests of French exhibitors only and derives no profit from the work which it performs. It is controlled by a Council, which is elected by the Committee in general meeting every three years. The Council is divided into four Committees, which form the executive of the Society, and is further assisted by a Judicial Council composed of lawyers and barristers, who act in an honorary capacity as the legal advisors of the Society.

The functions of the Executive Committees are divided in the following manner :—

(1) *Committee for Propaganda.*—Recruiting new members, collecting subscriptions and donations, &c.

(2) *Committee of Enquiry and Preliminary Organization.*—The study of projected exhibitions, enquiries, and preliminary negotiations with the promoters of the exhibition or other competent authority.

(3) *Committee for Entertainments and Receptions.*—Organization of receptions, banquets and entertainments of every description.

(4) *Committee for Accounts and Publications.*—General management, finance, accounts and publications.

The decision as to whether the Committee shall take part in any exhibition rests with the Council, and is based upon the report made by the Committee of Enquiry and Preliminary Organization. If, upon the report of that Committee, it is decided to take part in an exhibition, a Special Committee is formed to undertake the work of forming a French section from members of the Society who are willing to exhibit, and the organization is thus retained in the hands of the actual exhibitors themselves.

The best example of the second system of organization to which we desire to draw attention is, perhaps, afforded by Germany. Under the German system the entire organization, preparation and supervision of the German sections is in the hands of a single official, nominated by the Imperial Chancellor and appointed by H.M. the Emperor. Large sums of money are granted by the Imperial Government to defray the cost of preparing and organizing the exhibits, and these sums are placed in the hands of the Imperial Commissioner with full responsibility.

Liberal assistance is given to German exhibitors from the Government Grant towards the cost of transport, insurance, installation and decoration, and the Commissioner is thus enabled to refuse all exhibits which are neither characteristic of German production, nor representative of the best work of the country. The principle of selection is rigidly adhered to ; collective exhibits are formed wherever possible ; and neither trouble nor expense is spared to ensure that the representation of German arts and industries is effective and complete.

After careful consideration of the evidence before us, we are not disposed to think that either of the systems to which we have alluded could usefully be adopted in this country. To a large extent the success or failure of a particular system of organisation must depend upon the national character and upon the customs of the country. The tendency of British manufacurers, as a whole, would appear to be towards individual rather than collective effort, and we therefore doubt whether a system of organisation, such as that which exists in France, would prove satisfactory in this country.

In the same way we doubt whether direct Government control, such as prevails in Germany, would be acceptable to the majority of British exhibitors. It has usually been one of the guiding principles of British policy in the past, that the Government should only do those things for the public advantage which the public is unable to do for itself. This policy has perhaps created a greater spirit of independence among British manufacturers than is to be found among manufacturers in most other countries, and it is probable that many of them would be inclined to resent, as being unnecessarily interfering, any attempt to introduce a system of direct Government control on German lines.

D.—General Conclusions to Part II.

We have now given a brief summary of most of the principal points to which our attention has been drawn in connection with the participation of Great Britain in past exhibitions. We have seen that owing to the lack of any clearly defined policy with regard to exhibitions, no continuous system has been followed in the past.

No adequate machinery has existed hitherto for determining whether the participation of this country in any given exhibition was desirable or the reverse, and the decision of H.M. Government to take part in an exhibition has therefore been taken at too late a date to permit of proper preparation being made for the organization of the British section.

Owing to the lack of continuity between one Commission and another the participation of Great Britain in each successive exhibition has been treated as if it were an entirely new problem, and no consecutive or clearly defined course of action has been followed with a view to securing the complete and effective representation of the national industries.

In the first part of our Report we have dealt in some detail with the reasons which render it difficult to obtain exhibits from many of the most important trades in this country. In the second part we have shown the inadequacy of the steps taken to overcome that difficulty, and the consequent failure to secure the co-operation of many of the best firms.

We have also shown how the natural reluctance of many manufacturers to incur the trouble and expense of exhibiting has been increased by the difficulties which they have had to encounter in connection with the space allotted to them, and with the installation, decoration and supervision of their exhibits.

As the result we find that, except in the art section, the British exhibits at all recent exhibitions have failed to afford an adequate and satisfactory representation of the nation's industries, and that though the advertisement derived by the exhibitors may in individual cases have been good, the advertisement derived from the British section by the nation as a whole has not been proportionate to the expenditure incurred.

In the preceding section we have expressed the opinion that none of the systems adopted by the Governments of other countries could usefully be employed in Great Britain. In the next part of this Report we shall indicate the steps which should, in our view, be taken in order to remedy the defects to which we have drawn attention.

PART III.—RECOMMENDATIONS.

It is, in our opinion, of the first importance that an improved machinery should be set up which will secure, first, a more prompt consideration of invitations to participate in exhibitions, and, second, a more effective representation of this country at any exhibition in which His Majesty's Government may decide to take part.

To obtain these objects it is essential that, before everything else, the Government should provide in future for continuity of organisation from exhibition to exhibition.

A.—Nucleus of Permanent Organisation.

The manner in which this continuity should be provided must to some extent depend upon the frequency with which it is to be expected that Great Britain will in future participate in International Exhibitions.

As to this no hard and fast rules can be laid down. We assume that participation will usually be confined in the future, as in the past, to International Exhibitions of the first importance, officially promoted by the Government of the State concerned and held, if not in the Capital, then in the industrial centre of the country.

For purely commercial purposes it would probably be sufficient if Great Britain were to participate in such exhibitions at intervals of from five to ten years. The fact cannot, however, be ignored that in many cases the governing considerations are political, and that His Majesty's Government could not invariably confine its appearance at International Exhibitions within the limits thus indicated.

We are of opinion that in order to effect the continuity of organisation to which we have referred it is necessary to appoint a permanent official whose duty it should be to collect full information respecting past exhibitions, and to evolve a proper system for application in the future.

We do not consider that the proper performance of this work necessitates the creation of a separate Department. On the other hand, we think that His Majesty's Government will be invited to take part in exhibitions of considerable importance with sufficient frequency to provide practically continuous employment for, at any rate, one official of standing.

The duties of such an official would be to preserve and make available for ready reference the records of past exhibitions; to organise a proper system of correspondence and management; to keep himself informed, as he could readily do, partly from study of the reports of His Majesty's representatives abroad, and partly from enquiries of his own, as to the nature and probable importance of exhibitions contemplated in the future; and to keep in touch with the principal manufacturers and traders in each industry, and also with Chambers of Commerce and other trade associations in the United Kingdom. He should also be expected to provide information for the use of the India Office and the Colonial Office in the event of its being required by the Governments of India or of any of the Colonies.

He would thus, when an invitation was received, be in a position to furnish without loss of time many of the materials necessary to enable His Majesty's Government to come to a decision; and would be able to advise as to the amount of support likely to be given by the commercial community, and as to the cost and form of participation in any given case. Finally, when an invitation had been accepted he would take an active part in the organisation and management of the British section.

The necessity for creating a separate Department for these purposes would, in our opinion, be avoided if such an official were attached to a large Department already existing (and the Board of Trade would appear to be the natural Department), from which it would be possible for him to draw in ordinary times such clerical assistance as he might require.

We think, however, that if continuity of organisation is to be adequately maintained, the officer in question should be primarily responsible for the proper management of any exhibition and that his standing should therefore be such as to eliminate any danger of his being placed in an unduly subordinate position.

In these circumstances, we recommend that a special officer—of approximately the rank known as Principal Clerk—should be attached to one of the departments of the Board of Trade as the officer specially concerned with exhibition work, and that he should be primarily responsible for the proper organisation, conduct, and winding up of all exhibitions. He would draw for clerical assistance upon the general staff of the Department, or on such other sources as the Board of Trade might arrange.

Assuming that such a man were appointed, the next point to which we wish to direct attention is that of the great advantage which may be gained by making it a rule to consult the Advisory Committee to the Board of Trade on Commercial Intelligence in regard to participation in all future exhibitions. This Committee is in every way a body suitable to advise with wisdom on such matters. It is largely composed of influential representatives from the principal trading centres of the United Kingdom, and its members also include representatives of the Foreign

Office, the Colonial Office, the India Office and of the principal groups of Self-governing Colonies. Not only would its advice on special points affecting commerce and organisation be valuable, but its influence with leading Chambers of Commerce and business men would carry very great weight in making any endeavour to secure their co-operation for the organisation of a British section. It is possible that this body might appoint a Permanent Sub-Committee to deal with exhibition work, and in this way the Government would secure a standing, though unpaid Committee, which would be of great assistance in securing that continuity which we consider essential.

B.—Method of Dealing with Invitations and Preliminary Arrangements.

Having thus settled the nucleus of a proper organisation, it may be well to indicate the course which it appears to us desirable to follow in dealing with invitations to participate in International Exhibitions.

Usually such invitations will be received either at the Foreign Office or at the Colonial Office. Under the present system it rests with the Secretaries of State for these Departments to advise as to whether and to what extent there are diplomatic or political reasons why an invitation should be accepted. Again, it rests with the President of the Board of Trade to advise as to the commercial aspect of any given case. The final decision whether an invitation should be accepted rests with the Treasury.

We do not, of course, suggest any change in the relations or responsibilities of the various Departments as thus defined; but we believe that the process of considering invitations to exhibitions would be greatly facilitated were there a special officer of the kind suggested above to whom ready reference could be made by any of the Departments concerned, and whose functions would be at this stage purely advisory.

When the Government has finally decided to take part in an exhibition and to assign a grant for that purpose, the next question to be considered is whether the proposed exhibition is of such importance that it is desirable to appoint a Royal Commission to manage the British section. We have taken a good deal of evidence as to the value of a Royal Commission in relation to exhibitions, and we consider that, for the more important International Exhibitions at least, the balance of evidence is undoubtedly in favour of their continuance as more suitable to British conditions than any other arrangement, provided that the Royal Commission in future takes its principles of organisation from the permanent officer whose appointment we have recommended.

There has been a good deal of criticism directed against the unbusinesslike methods of Royal Commissions, and their failure to act promptly and to get into proper touch with commercial men. It has been freely suggested to us that a greater number of good business men are required upon such Commissions. We think that in the past, owing to want of organisation and the consequent delay in getting to work, there has been a good deal of reason for the criticisms which have been directed against Royal Commissions as a system. On the other hand, it is generally admitted that the existence of a Royal Commission gives prestige to the British participation in any large exhibition, that on the whole it carries the confidence of the business world as regards unbiassed administration, and we consider that there is no other alternative which can usefully take its place.

We recommend, therefore, that for all really large exhibitions in which the Government decide to participate there should as a general rule be a Royal Commission, and that the permanent exhibition expert to whom we have referred should act as Secretary and Commissioner-General. Such Commissions have sometimes tended to be unwieldy, and we think that it will be advisable to avoid the appointment of such a large number of members on a Royal Commission as there have been occasionally in the past, and also to secure the representation of a larger proportion of commercial men.

In the case of less important Exhibitions, at which H.M. Government may desire to be officially represented, but for which the appointment of a Royal Commission is

considered unnecessary, we think that the organisation and management of British exhibits might properly be left to the Advisory Committee to the Board of Trade on Commercial Intelligence and the permament expert.

We consider that as soon as it has been decided to appoint a Royal Commission in any given case it would be desirable to submit the question of the selection of commercial members of the Commission to the Advisory Committee of the Board of Trade. We have no hesitation in suggesting that in this way the best commercial advice would be made available for the Royal Commission.

We cannot too much insist that the permanent expert whose appointment we have recommended should be the man who is to take the lead in the organisation of even the largest exhibition. We think it absolutely essential that he should at an early stage of the preparations for the exhibition visit the exhibition ground and superintend the details of organisation on the spot; and that later, when the exhibition is opened, he should be there to control the staff and to give the exhibitors any assistance they may require and also the benefit of his experience and advice.

C.—Certain General Principles of Management.

It is not, in our opinion, possible to lay down any hard and fast rules as to how the money granted by Government for participation in any exhibition should be spent.

It may, however, be stated as a general principle that any grants of money made by the Government should be primarily devoted to the proper organisation and administration of the British Section, and that the assistance afforded to exhibitors out of Government money should not take the form of a direct subsidy.

The amount of assistance to be given to exhibitors must depend largely upon the varying conditions and circumstances of each case. In the case of exhibitions at a great distance, such as those at St. Louis, it will probably be found necessary, in order to secure a representative national display, to give a greater amount of assistance than for exhibitions at Paris or Vienna. In special cases of this nature, it may be necessary to pay a part at any rate of the cost of freight and insurance as well as of installation, decoration and supervision. As a general rule, however, we think that the aim of the Government should be to provide improved organisation rather than an increase of financial assistance.

Economies would, in our opinion, be effected if the expenditure on Exhibitions were subjected to a stricter financial control than has been the case in the past. It is perhaps outside our province to determine the mode in which this control should be exercised, but we venture to indicate two alternatives. Either an estimate of the proposed expenditure of any grant should be submitted to the Treasury for their information and approval, under specified heads, as for instance (a) salaries and wages, (b) office accommodation, (c) erection of buildings, (d) decoration of British section, and (e) entertaining; or a representative of the Treasury should be invariably added to the body—be it Commission or Committee—responsible for the expenditure.

We now desire to refer specifically to one or two points of administration to which we think that the attention of the permanent expert should be specially directed.

1. *Space for British Section.*—The requisite amount of space in a suitable position should be secured for the British Section at the earliest possible date, and steps should be taken to ensure that exhibitors are informed as soon as possible of the amount of space available, its position, lighting and general characteristics.

2. *Insurance.*—The preliminary arrangements for the organisation of the British Section should be completed with the least possible delay, in order that the insurance of exhibits may be effected before the market has become adversely affected by the acceptance of risks of foreign exhibits.

3. *Installation of Exhibits.*—Provision should be made for an adequate supply of labour to be available for British exhibitors at a reasonable charge, and every effort should be made to minimise as far as possible the trouble and expense, of which complaint has so frequently been made. It will be for the consideration of the permanent expert whether this object may best be attained by the establishment of a bureau for the supply of locally-engaged workmen at the exhibition, or by

engaging a sufficient staff of workmen in this country to undertake the whole work of installation in complete independence of the local contractors and workmen.

4. *Decoration of British Section.*—It is, in our opinion, essential that the decoration of the British Section should be left in the hands of an expert adviser, to be undertaken as one general scheme. Care should, however, be taken to acquaint exhibitors beforehand with the nature of the proposed scheme, and every effort should be made to secure uniformity of showcases and decoration without interfering unduly with the wishes of individuals. We think that much may be done to reconcile conflicting interests if the work is undertaken early enough, and if individual exhibitors are tactfully approached.

5. *National Pavilion.*—We recommend that in so far as the rules and regulations of the exhibition permit, the aim of the British Commission should be to erect an attractive building of architectural merit, but of less costly and durable materials than heretofore.

6. *Supervision of Exhibits.*—It is in our opinion advisable that the members of the executive staff in charge of the British Section should have a good knowledge of at least French or one other European language. It should further be the duty of the Commissioner-General to ensure that there are sufficient number of officers attached to the British Commission, who are conversant with the language of the country in which the exhibition is held. These officers should be available, as far as possible, to assist exhibitors in any difficulties which may arise, owing to their inability to speak the language.

7. *Entertainments.*—We consider that a proper system of social entertainment, within reasonable limits, is a necessary accompaniment to the work of any British Commission.

We have now dealt with all the more important points to which our attention has been directed in the course of our enquiry. To a large extent, of course, the manner in which the administration and management of British Sections shall be carried out in future must be dependent upon circumstances of time and place. We have, therefore, confined ourselves to laying down certain broad principles of action which we consider to be of universal application, and which are, in our opinion, essential if Great Britain is to be represented at International Exhibitions in a manner worthy of her reputation as a manufacturing country.

We are satisfied that if effect is given to the recommendations which we have made much of the difficulty which has been experienced hitherto in obtaining creditable exhibits will be removed, and a considerable saving of public money be effected.

In conclusion we desire to place on record the obligations we are under to our Secretary, Mr. U. F. Wintour, for the zeal and ability he has displayed in our service and for the efficient manner in which he has discharged the duties imposed on him by our Inquiry.

APPENDIX A.

CIRCULAR LISTS OF QUESTIONS ISSUED BY THE INTERNATIONAL EXHIBITIONS COMMITTEE.

Circular No. 1.

1. What has been your experience in connection with exhibitions?

2. Have you formed any opinion as to their effect on—

(a) the manufacturing and exporting trades of this country;
(b) British arts;
(c) the general commercial relations between the countries concerned?

3. If so, which, in your opinion, are the particular industries, or classes of industry, that have chiefly benefited by exhibitions, and in what way have they benefited?

4. Do you consider that the interests of any industry or classes of industry are adversely affected by exhibitions? If so, which are the industries, and in what way are they affected?

5. Do you consider that the direct commercial results obtained by the official participation of this country in International Exhibitions have been such as to warrant His Majesty's Government in giving grants for the organisation of British exhibits in the future?

6. Do you consider that equally satisfactory results could have been obtained by private enterprise?

7. Assuming that public money is, in any case, granted for the organisation of official exhibits, do you consider that the grant should be made subject to any special conditions as regards

(a) the accommodation and facilities offered by the exhibition authorities;
(b) the number and quality of exhibits offered by British firms?

8. Can you state briefly what have been the methods employed by the British Government in organising exhibits for International Exhibitions?

9. How do British methods compare with those of other countries, notably those of

(a) Germany;
(b) France;
(c) the United States;
(d) Austria-Hungary;
(e) Belgium;
(f) Italy;
(g) Switzerland;

10. What, in your opinion, have been the chief causes of success or failure of British exhibits in the past, and in what way do you think that the defects, if any, could be remedied in future?

11. Do you consider that any, and, if so, which of the methods employed by foreign countries could usefully be adopted for the organisation of British exhibits?

12. Do you consider that the appointment of a Royal Commission constitutes a satisfactory method of dealing with the organisation and preparation of British exhibits, or, if not, what alternative machinery would you suggest?

Circular No. 2.

(Issued to Chambers of Commerce and Manufacturers only).

1. Have you / your firm ever exhibited at any great International Exhibitions abroad, and, if so, what were the Exhibitions, and where were they held?

2. What was the nature of the goods exhibited by you, and what approximately was their value?

3. Have you had any increase of business with foreign countries which you can directly attribute to the exhibition of your goods and their inspection by visitors at such Exhibitions?

4. Have you ever experienced any actual disadvantage from exhibiting at such Exhibitions, either from having your goods copied by foreign competitors, or in any other manner?

5. Do you attach any considerable value, as a means of developing your business, to the awards which you have obtained at Exhibitions, and, if so, for what reason?

6. Have you ever been induced to buy from British or foreign manufacturers to any considerable extent, as the result of having inspected their goods at any Exhibition?

7. Can you specify any definite points on which you have derived instruction or knowledge from visiting Exhibitions, *e.g.*, methods of manufacture, economy in manufacture, or opportunity to purchase improved machinery and the like?

8. If you have refrained from exhibiting your goods at great International Exhibitions in the past, or have discontinued exhibiting, what, briefly were the reasons by which you were actuated?

9. If disinclined to exhibit from a business point of view, would you, with the object of ensuring that British manufacturers were creditably represented among the exhibits of other countries, be willing to exhibit at great International Exhibitions in future, provided that some permanent organisation were available which would minimise the trouble and cost to individual exhibitors?

10. Are you of opinion that this country should hold aloof from International Exhibitions generally, or do you consider it indispensable that an effective display of British machinery, manufactures and works of art should be made at such Exhibitions?

11. Have you any observations to make (a) upon the organisation of British exhibits at International Exhibitions with which you have been acquainted in the past, or (b) with regard to any improvement which could be made in the organisation of British exhibits in future?

APPENDIX B.

Circular Enquiry sent through the Foreign Office to H.M. Representatives Abroad.

The President of the Board of Trade has appointed a Committee, consisting of representatives of the Treasury, Foreign Office, Colonial Office and Board of Trade, together with four gentlemen possessing special commercial experience, to make inquiries and report with reference to the participation of this country in great International Exhibitions.

The terms of reference to the Committee are:—

> "To inquire and report as to the nature and extent of the benefit accruing to British arts, industries and trade, from the participation of this country in great International Exhibitions; whether the results have been such as to warrant His Majesty's Government in giving financial support to similar exhibitions in future, and, if so, what steps, if any, are desirable in order to secure the maximum advantage from any public money expended on this object."

For the purposes of this inquiry, the Committee are desirous of obtaining information with regard to the policy pursued by the principal commercial competitors of the United Kingdom, and particularly by the Governments of Austria-Hungary, Belgium, France, Germany, Italy, Switzerland the United States of America, and Japan.

The Committee are especially desirous of obtaining a full report with regard to the methods adopted by the Governments of the countries mentioned in regard to :—

(*a.*) The official organisation and preparation of exhibits for International Exhibitions abroad.

(*b.*) The subsidising of individual or private undertakings working on the same lines.

Information should be furnished with regard to the following points in particular :—

(1.) On what principle does the .....* Government act in regard to accepting invitations to participate officially in International Exhibitions ?

(2.) In what exhibition during the past twenty years has that Government taken part ?

(3.) What has been the total amount granted by the .....* Government in each case for the purpose of participation, and for the organisation and preparation of an official exhibit, and what was the amount actually spent ?

(4.) By what body or organisation were the grants expended in each case ?

(5.) What was the constitution of such bodies and by whom were they appointed ?

(6.) By what rules were they governed in allocating the grants to the various heads of expenditure, and what was the amount allocated to each principal industry or group of industries ?

(7.) What was the constitution of the Executive Staff to which the organisation and preparation of the exhibits was entrusted ?

(8.) What was the cost of the pavillion at each exhibition, and what price was obtained for it at the close of the exhibition ?

(9.) What were the methods employed by the Executive Staff in obtaining exhibits from each industry, and what were the rules governing the acceptance of such exhibits ?

* Insert name of Country.

(10.) Did the Executive Staff exercise any right of selection in regard to the exhibits offered, or were all persons desirous of exhibiting treated on an equality irrespective of the quality or suitability of their goods; in other words, was the exhibit organised by the Executive Staff, what is known as a "collective exhibit," that is to say, a *selected* exhibit, organised solely with a view to showing what was best in each branch of the industry, or were similar goods of varying degrees of quality, workmanship and finish accepted for inclusion in the exhibit from any persons or firms who desired to be represented?

(11.) If a collective exhibit, were the names of the owners or manufacturers displayed in such a manner as to make it clear by whom each article was contributed?

(12.) What were the arrangements made with the owners of the goods in regard to—

(*a.* Packing

(*b.*) Transport and insurance,

(*c.*) Installation and maintenance in repair,

(*d.*) The representation of individual firms whose goods were included in the official exhibit,

(*e.*) Sale of goods during the exhibition,

(*f.*) Re-packing and returning goods after the close of the exhibition?

(13.) By whom was the cost of these operations borne, and what, if any, was the proportion borne by the owner of the goods?

(14.) By what principles were the organising staff guided in allocating the space at their disposal—

(*a.*) To each group of exhibits,

(*b.*) To the goods of individual exhibitors?

(15.) What was the total number of .....* exhibitors in each group, and how did the awards gained by them compare with those gained by exhibitors of other nationalities in the same groups?

(16.) Are .....* manufacturers generally willing or reluctant to take part in International Exhibitions?

(17.) What are the reasons generally put forth—

(*a.*) In favour of, or

(*b.*) Against exhibiting at International Exhibitions?

(18.) What are the opinions of British merchants or of British Chambers of Commerce in foreign countries with regard to the local effect of exhibitions on British trade and prestige?

(19.) Is it proposed to hold any great International Exhibition in.....* in the near future, and if so, where is the Exhibition to be held?

N.B.—Full details should be furnished under this question of any proposals for an Exhibition in which it is likely that this country will be invited to participate. Copies of the regulations governing the admission of foreign exhibits and any other information of interest to intending exhibitors should be forwarded.

* Insert name of Country.

APPENDIX C.

Reports by H.M. Representatives Abroad

I.—AUSTRIA-HUNGARY.

With reference to the Embassy Note of January 31st last, the Imperial and Royal Ministry of Foreign Affairs has the honour to send the following replies to the schedule of questions communicated by the Embassy regarding official participation in Foreign Exhibitions. This reply is based on information supplied by the Ministry of Commerce. It must be pointed out that it has not been found possible to furnish categorical replies to the various queries, partly because statistical data regarding Exhibitions are not kept in Austria, and partly because the enquiries are in many instances not applicable to the conditions existing in this country.

No permanent organisation exists in Austria, as it does in France, for the purpose of preparation for and participation in International Exhibitions held abroad. Consequently the question of participation and of the manner in which it is so accomplished must be decided in each individual case. There is, however, a Department of the Ministry of Commerce, within the competency of which fall all questions regarding Exhibitions, so that the Ministry of Commerce is in a position to exert its influence in the matter of participation in foreign Exhibitions and in questions connected with such participation.

As regards the possible methods of participation in foreign Exhibitions a distinction must, in the first place, be drawn between State-organised participation and participation undertaken by some Corporation, such as a Chamber of Commerce and Industry, a Society of Commerce, or a Committee formed for the special purpose of the Exhibition. It is naturally in the former of these two cases that the Minister of Commerce exercises the greater degree of control; in the latter he is only in a position to bring indirect influence to bear, by including representatives of his department in the Commission dealing with the Exhibition. In the former case the money required for participation in the Exhibition is provided by the State, whereas in the case of enterprises organised by Committees or other bodies desirous of participating in the Exhibition the necessary funds are raised by means of subscription, and the State grants a certain subsidy, the amount of which depends upon how much has been collected by subscription Also other public factors, such as Provincial and Communal Representative bodies often devote considerable sums to the purpose of participating in Exhibitions.

The official participation of Austria in a foreign Exhibition can naturally only occur when an invitation to that effect has been received by the Austrian Government from the country where the Exhibition is being held.

Since 1890 Austria has taken part in the following Exhibitions held abroad:—

£12,500. In 1893—The Chicago World Exhibition. Credit 300.000 kronen.

£125,000. In 1900—Paris World Exhibition. Credit 3,000,000 kronen.

£250. In 1901—Austrian Export Exhibition in Denmark and Sweden at Copenhagen. Credit 6,000 kronen.

About £1,458. In 1901—International Exhibition at Glasgow. Credit 35,000 kronen.

About £1,083. In 1902 and 1903—Exhibition of Clothing Industry at St. Petersburgh. Credit 26,000 kronen.

About £5,185. In 1902—Austrian Exhibition of Industrial Art in London. Credit 124,450 kronen.

In 1902—International Industrial Art Exhibition in Turin. Credit 40,000 kronen. About £1,666.

In 1903—The "Children's World" Exhibition in St. Petersburgh. Credit 20,000 kronen. About £833.

In 1904—International World Exhibition at St. Louis. Credit 1,100,000 kronen. About £45,833.

In 1906—International Exhibition held at Milan. Credit 200,000 kronen. About £8,333.

In 1906—International Exhibition at Bucharest. Credit 50,000 kronen. About £2,083.

In 1906—Austrian Exhibition at Earl's Court, London. Credit 500,000 kronen. About £20,830

At the Exhibitions at Chicago in 1893, at St. Louis in 1904, and at Milan in 1905 Austria's participation was organised by the State, whilst in the case of the other Exhibitions its participation was arranged by private enterprise and promoted by the above-mentioned State subsidies.

The Composition of the Committees was very various in the different cases, but the chief Trading and Industrial Corporations were invariably represented in the Committees. These bodies were formed partly by means of nomination of the members by the Minister of Commerce and partly by way of co-optation. In the case of official participation the Minister of Commerce appointed a Commissioner-General, who was charged with the preparations for the Exhibition and with the duties of representation at the place where the Exhibition is being held. In the case of private participation in foreign Exhibitions these duties usually devolved on the Presidential Bureau of the Commission.

For the purpose of encouraging people engaged in various branches of industry to take part in the Exhibition, it has always been found necessary to institute a propaganda, with the object of demonstrating to individual exhibitors the commercial importance of their co-operation.

The various conditions required for participation were laid down in a list of specially drawn up regulations which were taken as a basis in deciding as to the admission of the various exhibitors.

With regard to the inquiry as to whether collective exhibits were formed or whether the various exhibitors displayed their own articles, it must be pointed out that the practice on this point has always varied in the case of different Exhibitions and different branches of industry. It is, therefore, difficult to lay down any uniform principle on this subject. This observation also applies to Query No. 11 (as to whether in the case of a collective exhibit the names of the exhibitors of the various objects are given). The practice on this point has been different in different cases, deference being shown to the wishes of the exhibitors. The exhibitor has always had to bear the costs of packing, transport, insurance, installation, representation of the various firms, repacking and sending back the exhibits. Recently an attempt was made to establish at the Exhibitions so-called Commercial Enquiry Offices, whose business it was to assist the various exhibitors by their advice and help in commercial questions. The results of this experiment cannot, however, be described as having been very successful, and the selection by the various exhibitors of their own representatives would probably be found more advantageous.

The sale of articles during the Exhibition is naturally permitted, but as a rule they may not be

removed from the Exhibition Hall before the close of the Exhibition. In many cases the exhibitor is obliged to cede a portion of the purchase price (10 per cent. for example) to the management of the Exhibition.

No fixed principles can be given regarding the question of the allocation of space mentioned in Question 14.

As regards the number of awards gained at the various Exhibitions and the proportion of Austrians gaining awards to that of the successful competitors of other nations, it is suggested that information on these points may be best obtained from the Reports published by the Commissions of the Exhibitions in question. These Reports are no doubt at the disposal of the British Government.

As regards the participation of exhibitors it cannot be denied that the fact of there having been in recent years such a large number of the most various kinds of Exhibitions has aroused a certain feeling of tiredness among exhibitors.

The principal argument in favour of participation in International Exhibitions is to be found in the circumstance that they offer a favourable opportunity for directing the attention of foreign countries to special industries and branches of industry. The principal arguments against participation are the great expense involved and the fact that many industries attain the same object, perhaps more successfully, by means of agents and permanent representatives.

Finally, as regards the enquiry as to whether there are any International Exhibitions contemplated in the immediate future, the Ministry of Commerce points out that in the coming year the Imperial Jubilee Exhibition (Kaiser-Jubiläums-Ausstellung) will be held in Vienna, which will include an International Section for the Army and Navy. The Ministry of Commerce also mentions that in 1910 the inauguration of an International Game-Shooting Exhibition (Jagd-Ausstellung) is also contemplated.

Further details as to these Exhibition schemes are not yet available. They will, however, be communicated in due course to the British Embassy.

Vienna, March 8th, 1907.

APPENDIX C.

Reports by H.M. Representatives Abroad

II.—BELGIUM.

As considerable interest appears to be shown by Belgian traders in International Exhibitions, both at home and abroad, it has been for some time past the object of the Belgian Government to participate somewhat largely in such exhibitions, and much care has been taken in laying down the lines on which such participation shall be exercised, and great trouble has been spent on the choice of their representatives on the boards and organising bodies of such exhibitions.

The method of representation in all exhibitions, whether in Belgium itself or in a foreign country, is in the first instance the same—*i.e.*, the Government begins by appointing through the Minister of Industry a "Commissaire-General," who is chosen as being a person of weight and influence, and who is directly responsible to the Government, with power to appoint all his subordinate officers. So important is this office considered that, in the case of an exhibition in a foreign country, the "Commissaire" is ranked higher than the local consular officer. A copy of the rules drawn up by the Minister of Industry is appended hereto, defining the duties and powers of these "Commissaires Généraux." (See Annex A.)

In Belgium itself, International Exhibitions have as a rule been promoted by limited companies, but, if the patronage of the Government is granted, as in the case of the Liège Exhibition held in 1905, and the forthcoming Brussels Exhibition, not only is the "Commissaire" appointed by the Government, but the Jury or Prize Committee are also their nominees.

With regard, however, to foreign International Exhibitions, in which the Government are desirous of organising a Belgian section, it is necessary before nominating a "Commissaire," to procure the requisite funds, and to do this, two distinct methods are employed. Either the Government introduces a Bill into Parliament, or contributions are gathered from the funds at the disposal of the different Departments of the State who supervise those industries which would be represented. The first of these methods is rarely resorted to, as the process is somewhat lengthy, especially if the Bill is opposed by any section of the House, the latter being therefore generally adopted, except in such cases as those of very large schemes, when the funds at the disposal of the various Departments are not sufficient for this purpose.

The advantages which the Government is able to hold out to intending exhibitors in exhibitions under State patronage are of considerable importance, for, in Belgium, the railways being under the control of the State, if not actually State owned, special rates can be quoted for the carriage of exhibits and materials intended for the Exhibition. Sometimes the larger exhibitors receive free passes on the Belgian railroads, and return fares are quoted for goods intended for exhibition at the same price as that usually charged for single fares. Then also the correspondence of the Government "Commissaire" is franked by the stamp of the Minister of Industry. Frequently, too, the Customs authorities receive orders to pass all goods, being *bonâ-fide* exhibits, free of duty across the frontier.

The necessary funds having been procured, the Ministry of Industry appoints the "Commissaire Général," whose first step is to nominate his officers as follows:—

1. A secretary (Secrétaire-général).
2. A treasurer (Secrétaire-trésorier).
3. Several assistant-secretaries.
4. An architect.
5. A "Directeur du service de la Manutention," and
6. Several "Attachés au service de la Manutention."

The duties of these officers may be defined as follows:—

The "secretary" is the chief adviser of the "Commissaire," and as a rule he is appointed on the advice of the Government as having had former experience in the organising of exhibitions. He is in charge of the correspondence of the "Commissaire."

The "treasurer" has the control of the accounts of the exhibition, or section, as the case may be, but he cannot sign cheques, except they are countersigned by the "Commissaire," nor has he any direct control over the expenditure.

The "assistant-secretaries" carry on the correspondence under the supervision of the secretary.

The "architect" is appointed to draw up plans of the exhibition buildings, and to watch their erection on behalf of the "Commissaire," for which service he receives a nominal salary.

The "Directeur du service de la Manutention" superintends the arrangement of the exhibits, and is assisted by his "attachés."

None of the above officers, with the exception of the architect, receive any remuneration for their services, their expenses alone being defrayed out of the funds at the disposal of the "Commissaire."

Patronage Committee

This body of officers, which is known as the "Commissariat Général," having been duly nominated, the next step is the formation of a so-called "Patronage Committee." This committee is made up of influential persons all over the country, whose object is to encourage the people of the district in which they live to take part in the exhibition.

From the members of this committee, who number several hundreds, smaller committees are formed with the object of advising the "Commissaire" as to the commercial value of intended exhibits as well as the classifying of them. Such sub-committees must necessarily include a certain amount of persons who are experts in the class of exhibits they have to deal with.

It would seem at first sight that some considerable difficulty would be experienced in getting together suitable persons for this purpose, but the secret of the success invariably attained in this respect is no doubt in no small part due to the fact that it is well known that at the end of an exhibition the Government distributes a large number of civil decorations to all those who have in any way contributed to its success.

Circulation of Catalogues.

After the "Commissariat Général" and "Patronage Committee" have been formed, the "Commissaire" issues, under the auspices of the Government, a preliminary catalogue setting forth the rules of the exhibition and the different groups under which exhibits may be made. The prices charged for the spaces to be let in the exhibition or section building are also quoted, as well as a list of all the officers and members of the committees. This catalogue generally attains a large circulation throughout the country, as, not only is it distributed widely by the "Patronage Committee," but circulation by post in franked wrappers is permitted by the Government within the limits of Belgian territory.

As examples of these catalogues hereto are appended:—

1. The catalogue of the Liège Exhibition, being an example of the style of catalogue usually issued for International Exhibitions held in Belgium itself. (Annex B.)
2. The catalogue of the Belgian section of the Bordeaux International Exhibition (which is now being held), being an example of a catalogue issued in connection with the Belgian section of an exhibition held in a foreign country. (Annex C.)

The catalogue of each exhibition must necessarily differ in some respects from any other, but these two examples may be taken as fair illustrations of such catalogues.

International Exhibitions in which Belgium has taken part.

The Belgian Government has, during the past twenty years, taken part in the following International Exhibitions in foreign countries:—

London	1889
Paris	1889
Barcelona	1889
Melbourne	1890
Paris	1890
Guatemala	1897
Paris	1900
Turin	1902
St. Louis	1904
Paris	1904
Milan	1906
Tourcoing	1906

Bordeaux International Exhibitions

To this list it is now possible to add the International Exhibition at Bordeaux which commenced last April.

It has not been found possible to obtain particulars of the total amount contributed by the Belgian Government to the financing of the above exhibitions, except in the case of the Bordeaux Maritime Exhibition, in which its liability is estimated at 202,020 francs (upwards of £8,080). In event, however, of all the space in the Pavilion of the Belgian section being taken up, the amount which the Government will have to pay at the conclusion of the Exhibition will be 127,000 francs (£5,080), and this may even be considerably reduced, as certain space on the terrace and grounds surrounding the Pavilion can be let on a profit-sharing system to catering companies and others.

In this same exhibition the cost of the Pavilion was estimated at 70,000 francs; it is to be a replica of the "Stein" at Antwerp, an old fortified building in which the "Inquisition," when Belgium was under Spanish rule, was conducted. The contract for the construction of this building, which was to be made from moulds taken from the original, includes the clause that the materials used in its construction shall, at the end of the exhibition, when the building is demolished, become the property of the contractor, thus avoiding the difficulty of finding a purchaser or otherwise disposing of them. It would appear that this clause is usually inserted in such contracts by the "Commissaire."

Collective Exhibits.

As regards "collective exhibits," they are, in so far as can be ascertained, arranged and organised entirely by the groups of manufacturers themselves. It is not, however, their practice in such cases to display the names of the different owners.

Packing of Exhibits.

At the conclusion of an exhibition the owner, as a rule, has to supply his own staff and materials for the packing of his exhibits, but some company-promoted exhibitions have in a few cases made other arrangements.

Insurance.

The exhibits are always insured by the exhibitor, if at all; only the buildings erected by the Government being insured by the officials.

Transport.

The conditions under which the exhibitor receives transport facilities must naturally depend much on the situation of the exhibition, but the "Commissaire Général" has it in his power to make any special arrangements he may think fit to reduce the expense of carriage of exhibits, such as the chartering of special cargo boats or special trains.

Sale of Exhibits.

As regards the conditions under which goods may be sold during an exhibition, the "Commissaire" is empowered in special cases to give permission for the removal of an exhibit immediately after sale, though the exhibition is not over, but this permission is rarely sought or granted. There are, however, in nearly all exhibitions stalls in which fancy articles are exposed for sale which may be removed immediately by the purchaser, but space for such stalls is only allotted on the condition that, at no time during the exhibition shall the stock be allowed to run out.

As a rule, a tax of not more than 10 per cent. is levied on all exhibits sold during the exhibition, whether such exhibits are removed before or after the close of the exhibition. In all cases the exhibitors are required to agree to the removal of their goods within a fixed time after the conclusion of the exhibition—generally one month.

Support Belgian Manufacturers.

Up to the present, when the Belgian Government have decided to organise, on the invitation of a foreign Government, a Belgian section, they have always obtained the support of Belgian manufacturers, and all the International Exhibitions which have of recent years been organised in this country have been equally well supported.

Views of British Manufacturers.

With the exception of one or two isolated cases, there are no British manufacturers whose interests are entirely confined to Belgium itself, but many British firms have agents in this country, and these agents have naturally every reason to welcome a local exhibition as producing a good advertisement, free of expense to themselves, for the goods of the firms they represent; but should these agents have to incur part of the expense of participation in such exhibitions, it is possible that they would take a very different view of the matter.

On inquiring of the British Chamber of Commerce in Brussels, it has been ascertained that with the exception of really important exhibitions (such as that in Paris in 1904) British merchants are not favourable to participation on the grounds of the multiplicity of such exhibitions, and the consequent expense, and were it not for the necessity of competing with local firms in order to hold their own in the world's markets, they would not, it is suggested, be represented.

Brussels Exhibition of 1910.

It is proposed to hold an International Exhibition in Brussels in 1910, for the promotion of which a company has been formed under the patronage of the Belgian Government, to which the British Chamber of Commerce has stated it is distinctly favourable, several of its members having indeed subscribed to the guarantee fund, which amounts to over two and a half millions.

The proposals of the promoters of this exhibition are not sufficiently advanced to permit of details being given with any fullness or accuracy, but it is evident that the intention of both the company promoting the scheme and the Belgian Government is, that this exhibition shall rank high amongst the great International Exhibitions of the world.

WALTER MONTGOMERY.

APPENDIX C.

II.—BELGIUM—*continued.*

Annex A. to Report on International Exhibitions.

(In Sir A. Hardinge's No. 33 Commercial, of 8th May, 1907.)

Reglement d'attributions des Commissariats du Gouvernement près les Expositions à l'Etranger.

Le Ministre de l'Industrie et du Travail,

Considérant qu'il convient de déterminer par une réglementation générale les attributions des Commissariats du Gouvernement institués auprès des Expositions officielles ou officiellement reconnues organisées à l'Etranger,

Arrête :

Article Premier.—Le Commissaire Général représente le gouvernement auprès des autorités de l'Exposition.

Art. 2.—Le Commissaire Général est chargé d'organiser la participation belge à l'Exposition. Il prend toutes les dispositions et assure l'exécution des mesures nécessaires à cet effet.

Il arrête et soumet à l'approbation du Ministre de l'Industrie et du Travail ; le budget général des dépenses, le plan des installations et de la décoration générale, le règlement général et le règlement du Jury.

Il ordonne la publication des catalogues et, éventuellement, celle des rapports des jurés.

Art. 3.—Tous les services du Commissariat sont placés sous l'autorité et la direction du Commissariat Général. Celui-ci répartit entre les divers secrétaires la besogne administrative et les travaux du secrétariat.

Il nomme les employés et gens de service, il détermine leur titre et leurs attributions et fixe leur traitement.

La nomination des agents dont la rémunération mensuelle excède 150 francs est autorisée, au préalable, par le Ministre, sur proposition écrite.

Aucune récompense pécuniaire ne peut être allouée sans l'approbation écrite du Ministre.

Art. 4.—La correspondance relative aux dispositions d'ensemble et aux mesures d'exécution est signée par le Commissaire Général et le Secrétaire Général du Commissariat.

Art. 5.—Les registres de comptabilité sont tenus sous la direction d'un trésorier ou d'un des secrétaires désigné par le Commissaire Général ; celui-ci est responsable envers le Gouvernement.

Les pièces justificatives des dépenses sont dressées ou vérifiées par le trésorier ou le secrétaire en faisant fonctions ; elles sont contresignées par lui et signées par le Commissaire Général.

Art. 6.—Aucune dépense supérieure à mille francs ne peut être engagée sans l'approbation du Ministre. Il en est de même des dépenses fractionnées afférentes à un même objet, dont le total atteint ce chiffre.

Chaque trimestre, un relevé général des dépenses est adressé au Gouvernement.

Art. 7.—Le Commissaire Général prépare et dirige les opérations du Jury des récompenses. Les membres belges sont nommés par le Gouvernement.

Art. 8.—Le Commissaire Général présente au Gouvernement les propositions pour l'octroi des distinctions honorifiques belges et étrangères, à décerner à l'occasion de l'Exposition.

Les négociations avec les représentants des Gouvernements étrangers en vue de l'échange des décorations, ne peuvent se faire qu'avec l'approbation écrite du Ministre.

Art. 9.—Lorsqu'il est institué une Commission de patronage pour favoriser et encourager la participation des producteurs belges, les rapports de cette commission avec le Commissaire Général du Gouvernement, dans l'accomplissement de leur mission respective, sont déterminés par un arrêté spécial.

Art. 10.—Les fonctions de membre du Commissariat Général du Gouvernement sont gratuites.

Toutefois, des frais de représentation imputables sur le crédit général mis à la disposition du Commissaire Général, peuvent être alloués par décision écrite du Ministre.

En dehors des frais de représentation, aucune dépense afférente au Commissaire ou aux secrétaires ne peut être portée en compte sans autorisation préalable du Minisre.

Art. 12.—Sa mission terminée, le Commissaire Général veille à ce que les dossiers, documents et toutes les pièces de comptabilité et autres du Commissariat soient versées dans les archives du Ministère de l'Industrie et du Travail, ainsi que des collections, en plusieurs exemplaires, des catalogues de la section belge et des sections de tous les pays participant à l'Exposition.

Art. 12.—Pour toutes les questions qui ne tomberaient pas sous l'application des dispositions qui précèdent, le Commissaire Général en référera au Ministre.

Art. 13.—La Direction de l'Industrie est chargée de veiller à l'exécution des prescriptions du présent arrêté.

FRANCOTTE.

Bruxelles, le 10 juillet 1906.

APPENDIX C.

Reports by H.M. Representatives Abroad.

III.—FRANCE.

Lorsque le Gouvernement français est invité à participer officiellement à une exposition internationale étrangère, il n'obéit à aucune règle générale. Il accepte ou refuse suivant des considérations qui peuvent varier pour chaque espèce et notamment suivant l'importance présumée, l'intérêt économique ou politique de l'exposition.

Dans ces vingt dernières années, le Gouvernement français a participé officiellement aux expositions internationales suivantes, et a affecté à cette participation les sommes ci-après :—

Expositions.	Crédits alloués. Frs.	Dépenses réelles. Frs.
1886—Liverpool, exposition universelle	—	—
1888—Bruxelles, exposition universelle	6,000	6,000
1888—Barcelone, exposition universelle d'agriculture, industrie et beaux-arts	3	—
1888-1889—Melbourne, exposition universelle	43,972,34	39,918,81
1892—Vienne, exposition de la musique et du Théâtre	15,000	12,688,50
1893—Chicago, exposition universelle	2,130,000	2,026,198,53
1894—Anvers, exposition universelle	120,000	86,390
1895—Amsterdam, exposition	54,000	40,613,96
1897—Bruxelles, exposition	464,650	430,162,97
1901—Glasgow, exposition	—	—
1904—St. Louis, exposition universelle	578,500	566,160,08
1905—Liège, exposition universelle	278,000	277,575,15
1906—Milan, exposition internationale des transports et des arts décoratifs	310,000	277,976,28 à ce jour

Dans les expositions les plus importantes comme celles de St. Louis, de Liège, de Milan, les dépenses ont été faites par le Commissariat Général ; dans d'autres, comme celle de Bruxelles, en 1888, la subvention a été employée par le Comité organisateur.

Suivant une règle constante, les dépenses faites par le Commissariat Général sont ordonnancées par le Ministre compétent, le plus souvent par le Ministre de Commerce.

La répartition des crédits entre les diverses industries ou sections est établie dans chaque cas au mieux des intérêts nationaux ; mais il n'y a pas de règle uniforme pour cette répartition.

Dans les expositions de Glasgow, de St. Louis, de Liège, et de Milan, le soin d'organiser la section française a été confié au Comité français des expositions à l'étranger, société reconnue comme établissement d'utilité publique par décret du 12 juin, 1901, et dont le siège est à la Bourse de Commerce de Paris.

Ce Comité était chargé de recruter, d'admettre et d'installer les exposants sous le contrôle du Commissaire Général.

A Liège et à Milan, le Comité était chargé en outre, d'assurer la décoration générale de la section française et de supporter les frais de gardiennage.

Pour faire face à ses dépenses, le Comité recevait une subvention du Gouvernement et était autorisé à solliciter le concours des municipalités, des Chambres de Commerce et des associations.

Les Comités d'admission et d'installation étaient composés de membres désignés à St. Louis par le Comité français des expositions à l'étranger avec l'agrément du Commissaire Général et nommés à Liège et à Milan par le Commissaire Général sur la presentation du Comité français.

Les membres de ces Comités ne pouvaient être choisis que parmi les exposants.

Les demandes d'admission étaient soumises par classe à l'examen de ces Comités.

Quand les expositions collectives étaient autorisées, il était généralement loisible aux propriétaires ou fabricants des produits ainsi réunis d'afficher leurs noms.

Pour le transport, des démarches étaient faites auprès des Compagnies de chemins de fer et de navigation afin d'obtenir l'application de tarifs de faveur aux envois des exposants.

L'assurance des produits et l'emmagasinage des caisses vides étaient assurés d'après les règlements généraux des expositions.

Les plans d'installation étaient soumis par les Comités d'installation au Comité d'organisation qui statuait sous le contrôle du Commissaire Général.

Les exposants étaient généralement responsables des dommages que leurs installations apportaient aux planchers, cloisons, etc., ainsi que des dégradations provenant d'un usage abusif.

La vente avec livraison immédiate des objets exposés ne pouvait généralement avoir lieu qu'avec l'autorisation écrite du Commissaire Général après avis du President du Comité d'organisation. Cette autorisation pouvait toujours être retirée à l'exposant qui devait, d'ailleurs, se conformer aux prescriptions du règlement général.

Aucun produit exposé dans les sections françaises ne pouvait être retiré avant la clôture de l'exposition sans l'autorisation écrite du Commissaire Général et après avis du Président du Comité d'organisation.

Le réemballage se faisait dans l'ordre prescrit par le Comité d'organisation.

Les frais de ces divers opérations furent suivant les cas, mise à la charge des exposants ou de l'exposition. A Liège, la manutention des colis (la reception dans l'enceinte de l'exposition, la mise à pied d'œuvre, l'enlèvement des caisses vides et emballages, la remise à pied d'œuvre des caisses vides et des emballages, l'enlèvement des colis re-emballés), était gratuite pour tous les colis de dimensions normales dont le poids ne dépassait pas 1,500 kgs. Pour les colis encombrants ou d'un poids supérieur à 1,500 kgs. l'exposant payait une taxe. Pour l'emmagasinage des caisses vides, une taxe était également établie par le règlement général.

La répartition des exposants français dans les divers groupes et les récompenses obtenues sont indiquées dans les rapports généraux des expositions.

Les fabricants français sont généralement favorables à la participation aux expositions étrangères. Ils tendent à s'y rendre de plus en plus nombreux : tandis que l'exposition de Chicago en 1893 ne comptait que 2,700 exposants français, celle de St. Louis, en 1904, en réunissait plus de 7,000.

Le chiffre des récompenses obtenues accusait une progression analogue. A Liège, plus de la moitié des récompenses ont été accordées à nos compatriotes : 864 grands prix sur 1662, 619 diplômes d'honneur et 1,318 médailles d'or.

Il est question d'organiser en France une exposition internationale de l'automobilisme et des sports et une exposition internationale de la vie ouvrière.

Pour chacune de ces expositions, une commission spéciale a été nommée par le Ministre du Commerce ; ces deux commissions ont déjà tenu un certain nombre de séances, mais n'ont pas encore établi un projet définitif.

APPENDIX C.

Reports by H.M. Representatives Abroad.

IV.—GERMANY.

In answer to the questions contained in the Note from H.M.'s Embassy of January 23rd last, concerning Germany's participation in international exhibitions, the following remarks are submitted:—

Question 1.—Germany has so far only accepted invitations to such international exhibitions when the State issuing the invitation took the entire organisation in its own hands, or guaranteed the success of the undertaking by granting official subsidies.

Question 2.—Germany has taken part officially at the following exhibitions:—

In 1889 at Melbourne.
,, 1893 ,, Chicago.
,, 1900 ,, Paris.
,, 1904 ,, St. Louis.
,, 1906 ,, Milan.

Question 3.—The sums granted by the Imperial Government for the said exhibitions are shown in Appendix I. These sums were not exceeded; but, on the other hand, small amounts were generally saved out of the grants. Besides the sums granted by the Imperial Government there were also considerable sums granted by the separate States, especially in the case of the exhibitions of Chicago and St. Louis. For example, the Prussian Ministry of Education and the Ministry of Public Works contributed. There were also special allowances made in the Imperial Budget for the participation of separate Departments.

Questions 4 and 5.—The disposal of the general exhibition funds was placed in the hands of the Imperial Commissioner with full responsibility.

Question 6.—The application of the exhibition funds depended on the special objects aimed at in the exhibition. The amounts granted to individual groups of industry depended on this consideration. The principle followed was to make grants only to such branches of industry whose participation was desirable, and yet were not sufficiently interested in exportation to take upon themselves large expenditure. The question of the advisability of giving an impulse to the development of certain branches of industry was also considered.

Question 7.—The entire organisation, preparation, and carrying out of the German Section was put in the hands of a single official nominated by the Imperial Chancellor and approved of by His Majesty the Emperor. The exception to this was at the Milan Exhibition in 1906, where the organisation in Germany was handed over to a central Commission, whose members looked after the separate exhibition groups, and the Commissioner himself simply represented the exhibitors, directed the jury, and represented the Government officially. This exceptional proceeding was considered desirable on account of the small extent of the exhibition, and because, with the exception of a few groups, it was a purely official exhibition.

Question 8.—About 600,000 marks (£30,000) were spent on the German pavilion in Chicago, about 1,000,000 marks (£50,000) on the one in Paris, and 1,400,000 marks (£70,000) on that at St. Louis. The German pavilion in Chicago was built of solid material, and was left as a present to the authorities of the South Park in which the exhibition took place, on the condition that it should always be kept in proper order. The German pavilions in Paris and St. Louis were not built to last for any length of time, and they were pulled down after the exhibitions were over. The building firm received simultaneously the order to put up the building and to demolish it afterwards. The solid interior fittings of the German pavilion in St. Louis, consisting of tapestry, floors, paintings on the ceilings, etc., were sold to American firms for about 110,000 marks (£5,500).

Questions 9 and 10.—In the choice of groups of exhibits, Germany's export interests were taken into consideration. Only such exhibits were accepted as could be easily included in the accommodation provided for the different sections without prejudice to the general impression created by them. As far as possible, collective exhibitions were formed, the choice of which was in the hands of a specially appointed committee. Exhibits which were neither characteristic of German production nor represented their best products were in all cases refused admittance. The principle followed was only to admit objects which might be expected to gain some recognition from the International jury.

Question 11.—In the case of collective exhibitions, the principle followed was to name the individual exhibitors taking part in them. Further particulars are to be found in the elaborate and detailed German catalogues. (See Appendix 2 and the enclosed printed matter.)

Questions 12 and 13.—The answers to these questions are to be found by referring to the official reports concerning the international exhibitions at Chicago and St. Louis, which contain detailed information on the subject.

Question 14.—For the answer to this question, see the official reports.

Question 15.—The number of the exhibitors at the various exhibitions in which Germany participated officially are given in Appendix 3. The percentages of the exhibitors gaining prizes only exist for the exhibition at Paris, and are to be found in the official report of the French General Commissioner (cf. Vol. 5, p. 204).

As an example, Germany received per 1,000 exhibitors:—

Grand Prizes.	Gold Medals.	Silver Medals.	Bronze Medals.
93	203	227	133

Question 16.—This cannot be answered in a complete manner. This depends on temporary economic conditions, and the expectations founded on the proposed participation. It will vary according to the general economic state of affairs, and will depend on the country of the exhibition and the nature of the groups of exhibiting industries.

Question 17.—The reasons for or against the participation in international exhibitions have often been discussed in public. It does not seem possible to give them within the limits of the answers to the questions asked.

Question 18.—It is not intended to hold an international exhibition in Germany in the immediate future. But, should such an exhibition be determined upon, Great Britain would naturally be requested to participate.

APPENDIX 1.

Expenditure on Exhibitions.

Names of Exhibitions.	Sums Granted by the Imperial Government.
International Jubilee Exhibition in Melbourne, 1888–1889.	250,000 Marks = £12,500.
International Exhibition in Chicago, 1893	3,600,000 Marks = £180,000.
International Exhibition in Paris, 1900	5,000,000 Marks = £250,000.
International Exhibition in St. Louis, 1904	3,500,000 Marks = £175,000.
International Exhibition in Milan, 1906	370,000 Marks = £18,500.
Total	12,720,000 Marks = £636,000.

APPENDIX 2.

Printed Matter Furnished.

Official report on the International Exhibition in Chicago, 1893, sent in by the Imperial Commissioner (2 vols.).

Official catalogue, Exhibition of the German Empire, International Exposition, St. Louis, 1904 (1 vol.).

Official report on the International Exhibition in St. Louis, 1904, sent in by the Imperial Commissioner (1 vol.).

Gentsch. The International Exhibition in Paris, 1900, and its results from a technical and economic point of view (1 vol.).

Official catalogue of the German Department of the International Exhibition at Milan, 1906 (1 vol.).

Milan, 1906	475

APPENDIX C.

Reports by H.M. Representatives Abroad.

IV.—GERMANY—*continued.*

Memorandum on German Participation in International Exhibitions.

The question of the material advantages to be derived by a nation from participation in International Exhibitions is one of great importance. In Germany opinions seem to have changed somewhat in recent years as to the actual benefits resulting therefrom, though the Imperial Government have always granted large sums for taking part in all such exhibitions abroad in the belief that a systematic and complete representation of their industrial resources would be of solid advantage to the general commercial development of the Empire. Though Germany participated, at great expense, in the Chicago, Paris, St. Louis, and Milan International Exhibitions, it is noticeable that there has never been any question of holding such a World's Exhibition within the territories of the German Empire.

The subject of the extent of the advantages to be obtained from such participation has to be considered both from the point of view of the Government and from that of the exhibitors. With regard to the Government, the general feeling at the present time is, undoubtedly, in favour of participating largely in all exhibitions to which foreign nations are admitted, though there are, occasionally, exceptions to this general policy, such as the recent refusal of the German Government to take part in the International Exhibition at Christchurch in New Zealand.

With regard to the future, however, one may confidently assert that no available opportunity will be lost of displaying abroad, whenever possible, extensive representative exhibits of German industry as a whole, and large sums are certain to be granted for such objects. The Imperial Government have always been careful to systematically organise all the German exhibits at International Exhibitions; they do not permit inferior goods to be shown. Indiscriminate participation, which might be detrimental to the German section at any exhibition, is not allowed, as it would be injurious to the interests of the Empire. The system that has been pursued in this respect will best be realised by a perusal of the enclosed copies of various memoranda, sent to the Foreign Office in recent years (see Enclosure No. 2) concerning German policy as regards the St. Louis Exhibition. The Memorandum on the organisation of the exhibits for the Paris Exhibition in 1900 is instructive.

The views of the exhibitors in late years seem to incline against exhibiting to the same extent as formerly at International Exhibitions. It appears from information obtained that the Government have often had considerable difficulty in persuading some of the more important German firms to participate, as the expense involved was great, and the advertisement of their goods unnecessary. It is said that orders have in some cases had to be given by the Government to certain firms in order to induce them to send exhibits of their manufactures. The general reasons put forward against such participation in International Exhibitions include the following, and are well illustrated in Consul-General Oppenheimer's Report (see Enclosure No. 3). The expense involved in making "show" exhibits and in renting space is out of all proportion to the orders obtained. The exhibits are visited rather by a sight-seeing public than by persons really understanding the technical and other improvements in the articles shown. This form of advertisement is not desired by the big firms, but it is often, in a way, forced upon them from fear of other small and less-known firms, making similar goods, depriving them of foreign orders. Small and unknown firms are enabled, on such occasions, to make a splendid show of goods, finished in an elaborate style for exhibition purposes, which may deceive customers as to the real quality and worth of their usual manufacturers. Moreover, new models cannot always be protected by patents. There is also a prevalent idea among the exhibiting public that the amount of foreign orders obtained from the fact of participation in International Exhibitions in late years has not been as large as might have been expected.

On the other hand the feeling of the manufacturers in favour of participation in all special exhibitions for a particular trade or industry (such as the 1902 Exhibition at Düsseldorf for German iron and steel products) is steadily growing; for it is felt that such places are chiefly frequented by persons really interested in and having a knowledge of the trade or industry in question, who consequently place many valuable orders with the exhibiting firms.

With regard to the opinion of British merchants in Germany on the local effect of exhibitions on British trade and prestige (Question No. 18 of the queries for the Exhibition Committee), it may be remarked that, except at Hamburg, there are hardly any such persons residing in the German Empire. Sir William Ward, H.B.M.'s Consul-General at Hamburg, states that local British firms are ceasing to participate in great exhibitions for the same reasons as those stated generally above, but that they advocate the exhibition of British products at special exhibitions of all kinds (see his Report, Enclosure No. 4). I would here call attention to Sir William Ward's recommendation (see page 3 of his Report) that a permanent exhibition of samples of British manufactures should be established at Hamburg. He thinks that such an institution would be likely to materially assist English commerce; and he further advises all British merchants doing business in any part of the world to employ local resident agents in that emporium of "oversea" trade in order to keep them informed as to foreign demands for all classes of goods. From my knowledge of this country I also endorse his suggestion.

A Report, received from Mr. Mulvany, at Düsseldorf, is also forwarded.

The general conclusions, founded on various data obtained, are as follows, with regard to British participation in foreign exhibitions.

(1) Participation in International Exhibitions is not always to be recommended from the exhibitor's point of view as financially profitable. But at the same time, from the Government point of view, one must always remember that non-participation, or participation on a small scale, may, if other competing nations show more extensive and picked exhibits, entail a serious loss on the nation as a whole if the result is that the visiting public is thereby led to transfer orders from former exhibiting firms to those of other nations.

(2) If British exhibits are sent to International Exhibitions, they should be representative of the resources of the United Kingdom, and ought to be systematically organised by competent authorities, as is done by the German Government. No inferior articles of smaller unknown firms should be admitted.

(3) British manufacturers should not fail to exhibit at all special exhibitions which are confined to one or more trades or industries; and, in this case, they should be careful to quote the prices of any articles exhibited at figures which include cost of carriage, etc., from Great Britain., *i.e.*, delivered in the country in which the exhibition is held, so that the buyer can at once compare the price of British products on the spot with those produced by local competing manufacturers.

William S. H. Gastrell.

Berlin, March 14, 1907.

Six Memoranda by Mr. Gastrell on Policy pursued by German Government with regard to Paris and St. Louis International Exhibitions.

Enclosure in Sir F. Lascelles' No. 97 Commercial of May 15, 1900.

Memorandum on German Exhibits at Paris Exhibition.

In view of the extraordinary care that has been taken by the German Government in collecting and arranging the German exhibits for the Paris Exhibition, it is most desirable that the British public should carefully study them, so as to obtain an accurate idea of the capabilities of the German industries at the present time. It will be remembered that the German Government voted no less a sum than £250,000 to be spent on providing at Paris a satisfactory representation of the Empire's industrial capacity. Great care was taken in organising local committees, to whom each article intended for exhibition at Paris had to be submitted and approved before being admitted actually to the German section of the Exhibition. The result is that a very high standard of goods in all branches of trade are now on show; all inferior goods, not first-rate quality, obtained no admittance. Therefore the present exhibits truly represent the best that Germany produces; and as at the Paris Exhibition, for the first time, the same kinds of products from different countries will be shown alongside one another, it is evident that a quite exceptional opportunity will now be afforded of making accurate comparisons of British and German similar products of all kinds.

It is for these reasons that it would be well could experts in the leading British trades be sent to Paris to take advantage of this chance of thoroughly examining the best specimens of German handiwork. It would be time well spent for technical men in the textile, iron, shipping, and chemical trades, for instance, to closely study German exhibits affecting their branches of industry. Electrical and mechanical engineers would also profit by such work at Paris. The expense of sending these technical delegates might be borne by different groups of manufacturers, or by the Chamber of Commerce, who would doubtless be amply rewarded for the outlay by the personal inspection and knowledge gained in a manner not often possible.

In the Prussian House of Deputies, in April, a resolution was unanimously passed, that the Government should defray the cost of sending to the Paris Exhibition a certain number of technical workmen to report on various subjects of interest to German industry and agriculture. It is also hoped that funds may be provided by societies and private persons (employers) for the same purpose. The Germans intend to utilise the opportunity of learning all they can about what other countries produce.

It is reported that the American agricultural machinery exhibited at Paris will, at the close of the Exhibition, go to Moscow. In order to anticipate possible damage to German makers of machinery from the American Exhibition in Russia, the "Society of German Industrialists" is trying to organise a German Exhibition in several Russian towns during the present summer. This incident serves to show the value attached by the German exporters to a proper representation actually in the foreign country of the articles which it is hoped to sell there.

Berlin, May 14th, 1900.

Enclosure in Sir F. Lascelles' No. 31 Commercial of Feb. 21, 1903.

Memorandum on Participation of Germany in the St. Louis Exhibition.

A recent article in the "Norddeutsche Zeitung" points out to the public the importance of a worthy and thoroughly representative exhibit of the capabilities of the German Empire at the coming St. Louis Exhibition. It further calls attention to the fact that, as at the late Paris Exhibition, similar classes of products will be grouped together in a scientific manner, and that consequently great care must be taken only to show in the German section really first-class articles. This object can only be attained by a certain amount of sacrifice and assistance on the part of the interested parties. The German Government therefore hopes, in view of the important German interests involved, that the requisite assistance to the authorities will be forthcoming.

This article shows that the greatest care will be taken, as on the last occasion of the German section at Paris, to only allow the best of every class of German manufacturers and products (so far as they are included in the scope of the St. Louis Exhibition) to be shown to the American public; it is quite evident that no inferior articles of any kind will be accepted as exhibits by the German Commissioner for the St. Louis Exhibition. It appears that he has sent out to various persons in German industries, institutions, etc., about 8,000 copies of papers concerning this Exhibition, including the forms of notification of a desire to exhibit, a programme of the Exhibition, and the list of the groups and classifications. In an accompanying letter he points out that a successful German representation at St. Louis will certainly help to improve German trade with the United States, and that the German good exhibited there will also indirectly be made much better known to all the central and South American countries who are also participating in this Exhibition, and from which many people will travel to visit it. Hence German markets will be extended all over the American Continent.

Exhibitors are told that they will not, as sometimes happened at the Chicago Exhibition, be unfortunate in their experiences as to orders received for goods, for since 1893, after the great crisis, an enormous prosperity has come about in America, which still continues.

Berlin, February 18th, 1903.

Enclosure in Sir F. Lascelles No. 46 Commercial of March 14, 1903.

Memorandum on Germany and the St. Louis Exhibition.

The President of the coming St. Louis Exhibition and former Governor of Missouri, Mr. D. R. Francis, has been visiting Berlin, and had the honour of being summoned by the German Emperor to an audience which lasted over an hour on the 9th instant. It is said that His Majesty expressed his great interest

in the undertaking, and promised to favour it by all possible means, and said how much importance he attached to a complete representation there of German school arrangements of all kinds, as also of art products of the Empire. After the audience Mr. Francis lunched with the German Commissioner to the Exhibition, Dr. Lewald. Many leading men were present, including the American Ambassador, several high German officials, and numerous prominent industrialists, more especially those interested in commercial relations with the United States. Mr. Francis was also recently entertained at dinner by Freiherr von Richthofen, Minister for Foreign Affairs, at which there were present several of the Prussian Ministers of State, besides other leading officials and private personages.

In the Press it is reported that the Prussian Minister of Commerce has held a meeting at his Ministry to consider the participation of the Rhenish-Westphalian iron industries in the Exhibition. It is said that the proposal was not very favourably received by the interested parties, and that they were against such a step, even after hearing Dr. Lewald give his reasons for such exhibits. That gentleman has opened offices in Berlin in connection with the work and correspondence concerning the Exhibition. He has, during February, visited Saxony, and held meetings at different industrial centres in order to urge the advisability of German industries exhibiting at St. Louis next year, both on "economic and political" grounds.

It may here be mentioned that the Saxon Government have named as their Special Commissioner to the Exhibition Herr von Nostiz-Wallwitz, now Secretary of the Saxon Legation in Berlin, who is at work in agreement with Dr. Lewald for the purposes of the Exhibition.

In a published account of an interview with Dr. Lewald, he is reported to have said that it was originally contemplated to have only exhibits of art, art products, and educational subjects, but that there had since been added the book trade, textiles, agricultural products, and provisions, and some exhibits of the steel industries and of machinery, the main idea being to develop German exportation. Manufacturers of furniture, and of art glass, porcelain, bronze, iron, gold and silver goods will have exhibits. He emphasised the importance of the textile branch being well represented in America. German agriculture would have many exhibits of all exported products, such as hops, seeds, barley for brewing purposes. The best kinds of German horses would also be shown. Wines and spirits would also be represented there. Complete sections, showing the German State methods of insurance for workmen, and of legislation for their protection would also be prepared. Finally, there was a project of a collective exhibit of machinery for making tools; the Solingen cutlery and arms industries would also figure.

It will thus be seen that the original plan for the participation of the German Empire in the St. Louis Exhibition is already being considerably enlarged, and that most of the more important German industries will probably be represented in some shape or another in America in 1904 in order to do all that is possible to further German commerce with the United States. That the original plan would eventually be enlarged was almost a certainty when the large grant of £125,000 to £150,000 altogether was made known in the 1903 Estimates, of which £75,000 are already inserted for the current year. As has already been pointed out previously, it is becoming more and more evident that Germany, backed by the Imperial Government with a lavish expenditure on the St. Louis Exhibition, is going to make a high bid for a larger American export trade to the United States at what is considered to be a favourable moment, seeing the present exceptional prosperity in North America.

Berlin, March 13th, 1903.

Enclosure in Sir F. Lascelles' No. 51 Commercial of March 19, 1903.

MEMORANDUM on Germany and the St. Louis Exhibition.

The Budget Commission of the Reichstag, on the 17th instant, sanctioned almost unanimously the total grant of £125,000 to £150,000 for the St. Louis Exhibition, and the insertion of £75,000 as a first instalment for 1903.

Count von Posadowsky, in the course of the discussion, remarked that the German exports to the United States were increasing, whereas those of other countries were decreasing, and he said that English art was preferred in America, and that, consequently, Germans must suit their productions to American tastes. There would be special openings for haberdashery, in which Great Britain's exportation was on the increase, and in silk goods, in which Switzerland was a competitor. There were difficulties as to the Customs clearance of exhibits, in connection with the duties, but every effort was being made for more favourable conditions. Exhibitors were not to show masses of general articles, but only special things, and those of the best quality only.

Dr. Lewald, Commissioner to the Exhibition, then spoke of the advantageous site obtained for the German section. He mentioned that the textile industry and the machine industries were still hesitating about exhibiting on account of the great expense involved. The makers of railway engines, however, had decided to participate. The chemical, paper, and porcelain industries, as also the manufacturers of arms, were all exhibiting.

In the Prussian House of Deputies the sum of £5,000 has already been granted as a first instalment towards the exhibits at the St. Louis Exhibition of Educational Methods and Apparatus in Prussia.

Enclosure in Sir F. Lascelles' No. 104 Commercial, May 8, 1903.

MEMORANDUM on Germany and the St. Louis Exhibition.

The German Press calls attention to the appointment of the British Commissioner for the St. Louis Exhibition, and to the fact that £30,000 has been granted as a part of the total to be spent in 1903-4 for the expenses of participation.

It points out that great efforts are going to be made in the United Kingdom to get people to take part in the Exhibition as much as possible, and that the Prince of Wales has been named President of the Commission. It presumes that he, or some other member of the Royal Family, will be England's chief representative at the opening ceremony. If not, Mr. Chamberlain or Lord Roberts are looked upon as likely persons to be sent on behalf of the British Government.

The "Borsen Courier" says that the great efforts being made in Great Britain to have adequate representation of British products ought to act as a further inducement to German industrialists to extensively

exhibit in order to get in touch, not only with the people of the United States, but also with those of British North America and of the South American States.

Sir William Ward, H.B.M.'s Consul-General at Hamburg, has now furnished me with the statement asked for on the reduced sea freights for German exhibitors destined for the St. Louis Exhibition, which is enclosed herewith. It will be seen therefrom that the reductions are very extensive, varying from 18 per cent. to 62 per cent., according to the various classes of goods. If these rates be considered jointly with the reduced freights on the Prussian State Railways (already reported on), it is clear that the intending exhibitors at the Exhibition are to be extraordinarily favoured in conditions of transport.

Berlin, May 7th, 1903.

Enclosure in Sir F. Lascelles' No. 209 Commercial of October 9, 1903.

MEMORANDUM on Germany and the St. Louis Exhibition.

An important statement has just appeared in the German Press in connection with German exhibits at the coming St. Louis Exhibition. It is to the effect that permission has been obtained from the management for exhibitors, especially of "Art Industrial" products, to sell duplicates of the goods at the stalls allotted for their display. The conditions attached to such sales must be sought for by each individual exhibitor. A fee calculated at a certain percentage on the gross proceeds is to go to the Exhibition Authorities; these will be fixed according to the nature and character of the goods.

The Press notices on the subject, of which a copy is enclosed herewith, further state that persons desirous of making use of this privilege should communicate as soon as possible with the Imperial Commissioner for the Exhibition in order that he may be able to make the necessary arrangements with the Exhibition Authorities.

It is to be presumed that similar privileges have also been obtained by the British Government from the Government of the United States. No information is given here of the nature of the above-mentioned "conditions of sale," nor would it be obtainable except by interested parties. It would, therefore, seem to be desirable in the interests of British trade that efforts should be made immediately at St. Louis to obtain this information.

I would call attention to another step, no doubt taken at the instigation of the Imperial Commissioner to the St. Louis Exhibition, recently taken by the two great steamship companies, the North German Lloyd and the Hamburg American Lines.

It appears that a reduction of 20 per cent. will be made for all exhibitors and their employees on the first class fares (including those on the express boats) between the ports of Hamburg and Bremen and that of New York, both on the outward and return voyages, on the condition that the former takes place between December 1st, 1903, and June 30th, 1904, and the latter begins on any date after August 1st, 1904, and, provided that the price thus obtained is not lower than the minimum charge for the particular steamer and voyage (which differs according to the time of year). No reductions, or only small ones, will be made for passengers booked at the lower rates. To obtain these privileges a certificate is required, which, presumably, is only issued by the Imperial Commissioner.

This active official has by a circular letter invited the manufacturers of motor-cars to take part in the Exhibition in Group 72; and it is stated that they are likely to largely participate.

Finally, it may be mentioned that, as is well known, the central "facade" of the Royal Palace of Charlottenburg is to be reproduced at St. Louis. The German Commissioner has further announced that the Emperor has authorised the use of some of his furniture, Gobelin tapestries, and silver table decorations to be used in decorating the "German House."

Berlin, October 10th, 1903.

Report by Consul-General Sir Francis Oppenheimer on Participation in International Exhibitions.

British Consulate-General,
Frankfort-am-Main,
16th February, 1907.

Sir,—I have the honour to acknowledge the receipt of your Excellency's despatch, dated February 4th, in connection with the information to be collected by the International Exhibitions Committee in England, and asking what are the opinions of British merchants in foreign countries with regard to the local effect of exhibitions on British trade and prestige; also asking for any observations which I should be able to make on the subject.

In reply I beg to state as follows:—

No British merchants of importance reside within the district of this Consulate-General. The opinion now submitted has been gathered from people connected with very important German houses, and, as far as I can judge, deserves every consideration, as, *mutatis mutandis*, it may be supposed to apply to British manufacturers also.

There can be no doubt that, generally speaking, the great international exhibitions are no longer regarded as blessings by manufacturers of standing. During recent years the aversion has greatly increased, and it has always required considerable pressure on the part of the Government to induce the leading firms in the various trades to participate in any one of the vast exhibitions, even after the Government had decided that Germany should be officially represented. In some cases the Government had to go so far as to place special orders with leading firms of manufacturers to ensure their participation; such orders may be regarded as subsidies.

The leaders of industry complain that the international exhibitions having developed into pleasure shows and fairs, the participation in these vast exhibitions causes considerable inconvenience, demands great financial sacrifices, and entails considerable risks.

The inconvenience is caused by the fact that current work has to be stopped, and the best men of the factory, engineers as well as workmen, are compelled to waste their time on show-pieces.

The financial sacrifice is caused by the fact that the pieces manufactured for the exhibition are mostly "ideal" pieces, for which customers are not easily found, but if found, certainly not at adequate prices. As an advertisement the cost bears no proportion to the result, as in most cases the cost falls most heavily on those who occupy so prominent a position in the trade that they do not require advertising on such a scale. The cost is so great, because these exhibitions are kept open without any regard to trade interests, and as long as possible to secure a financial success from the receipt of the gate-money. While the exhibition is open no article may be, as a rule, removed, and articles which can only be appreciated working must be kept working during the whole period.

The risk entailed concerns the publicity which is by "show models" given to the latest achievements, many of which cannot be protected by patents, but all of which are openly displayed. If old models were shown the purpose of the exhibition would be frustrated; the more recent the models are, the greater becomes also the temptation for pirates to copy. There is this risk also, that pieces sent to exhibitions are "finished" as no pieces are finished for ordinary trade purposes, so that if orders are placed in consequence of show-pieces, there must needs follow the discontent of buyers with the goods subsequently delivered, which do not look as neat as the ones shown, though from a working point of view they are in every way as good (*e.g.*, chassis of automobiles). It is said that more especially mushroom firms resort to this trick of exaggerated finish to attract customers, and their mode of procedure compels other firms to do the same.

If some maintain that the vast exhibitions bring no advantage to the majority of the first-class exhibitors, because the more important orders would have been placed even without an exhibition, others maintain that such an opinion is extreme, and that there is a harvest, even if it be not in proportion to the labour and outlay. At the end of the last World's Fair at St. Louis, there was a general feeling in Germany that the orders placed in consequence of the exhibition were few and far between, and certainly below even modest expectations. I believe it was in consequence of a general opinion to this effect that the Imperial German Commissioner for the St. Louis Exhibition was instructed to work out a schedule of the orders which had reached Germany in consequence of the exhibition. I have not been able to ascertain here what was the result of the Commissioner's inquiry, as my informants seem to think that such a schedule must be even more deceptive than the ordinary run of statistics.

There seems a general consensus that the greater share of the benefit, whatever it be, falls to less-known firms, and for these an international exhibition undoubtedly offers opportunities. It is comparatively easy for them to arrange a good show, to which they can give ample time and attention; yet, those who look below the surface know that their shows are no guarantee for the excellence of future deliveries, so that, as far as they are concerned, the reputation of their particular industry runs the risk of injury rather than advantage as the result of such exhibitions. Yet it is their very presence that forces the more prominent works to entertain the idea of a participation, because otherwise the less-known firms might do the leading works lasting damage instead of securing a possible overflow trade. For the purposes of the exhibition such unknown firms are put on the same footing as the leading firms of the industry; for there is, as a rule, ample space, and the extent of a firm's exhibition is simply a question of rent. It is said that often the small firms are first approached by the promoters of these vast exhibitions, who use their promise of participation as the lever against the leading firms of the trade. One informant assured me that the manner in which the promised participation of the less-known firms was utilised by the promoters nearly approached blackmail.

In spite of the enormous number of medals and diplomas conferred upon German exhibitors at the St. Louis Exhibition, the result was, from a German point of view, declared a failure. To render any similar disappointment impossible in the future, it had been suggested that all exhibition matters should be brought by an Imperial law under permanent Imperial Parliamentary control. The Imperial Government did not see its way to going this length, but it has recently acted upon the suggestion by officially acknowledging a committee of the "Central-Verband Deutscher Industrielle" as a standing committee for exhibition matters. The work of this committee is to extend more especially to the following three headings:—

1. To collect all material at home, and as far as possible abroad, dealing with exhibitions, and thus, in course of time, to establish an archive for exhibition matters.

2. To examine the question of German participation in any exhibition, to make the necessary inquiries amongst the possible exhibitors, to ascertain the scale on which participation would be advisable, and to advise the Government accordingly; also to examine the question of German exhibitions, their scope, etc.

3. More particularly to make a firm stand against "bogus" exhibitions, and to warn the industrials, for in spite of repeated warnings in the Press, firms have always been found willing to listen to the tempting overtures—to their own ultimate detriment. Without such an advisory board it is often impossible for a foreigner to gauge the seriousness of an exhibition to which he is invited by circulars from abroad. Among some manufacturers, moreover, the collecting of medals and diplomas, which are lavishly bestowed by inferior exhibitions, has become a mania, and the exhibitor often finds that the fees of such patents more than wipe out the cheapness of the space allocated, which was the primary inducement for his participation. It may here be noted that while medals and diplomas are considered of no value in the case of articles which are only supplied to the trade, they are still deemed of value by all those manufacturers who offer their goods to the public direct (*e.g.*, articles of food, soaps, pills, etc.).

It is confidently hoped by many serious manufacturers that the work of this German committee may lead to what might be termed a "disarmament" amongst manufacturers, and that it will become easier for members of a particular trade to limit their exhibits or to stand aloof, because they will in future have some guarantee that their competitors will do so also.

That the above is, generally speaking, the opinion of the leading German industrials concerning international exhibitions on the vast modern scale may be gathered from the singular fact that in Germany the idea of a World's Exhibition has never found favour, and that Germany is the only one amongst the leading industrial countries which has never held any such exhibition.

Special exhibitions (embracing only a special industry—trade exhibitions, so to say) are viewed in an entirely different light. They are regarded as a useful institution, and the favour with which they are received greatly adds to their success. The recent Dusseldorf Exhibition (though it was only national) is a good case in point. It had been convened to give as near a complete picture as was possible of the Rhenish iron industry; it achieved its purpose, met with undisputed praise, and is said to have brought tremendous advantages to that particular industry as a whole. There is no doubt that for the serious manufacturer it becomes an easier matter there to exhibit than in a general exhibition, for the exhibits are addressed, so to say, to those only interested in a particular branch of manufacture; current work can be exhibited, and its workmanship can be appreciated; the specialities of the various firms can be distinguished, for those to whom they are shown are experts, and it becomes a difficult matter for the outsider to make a hit (unless his work really deserves it), as his circumstances are more intimately known, or can be easily ascertained. These trade exhibitions, moreover, can be more easily limited in time, for the trade papers advertise the exhibition, and those interested will attend soon after the opening, so as to be the first in the field. The public being limited *ab initio*, the speculative element, which has turned the international exhibitions into fairs, is discarded. Again, the limited size of the trade exhibition renders an examination possible without undue fatigue. It is said that for such exhibitions a Government subsidy is approved, even outside the trade more immediately interested, because the sum needed to ensure success is much smaller than that needed for the participation in international exhibitions, and is sure to become a better national investment; it never can be called frivolous—the term applied by one of my informants to the subsidies granted for the world's fairs.

It is sincerely to be hoped that, whenever possible, British industry will make an effort to participate in international trade exhibitions.

I have the honour, etc.,

(signed) F. Oppenheim.

His Excellency the Right Hon. Sir Frank C. Lascelles, G.C.B., G.C.M.G., H.B.M.'s Ambassador Extraordinary and Plenipotentary, etc., etc., etc., British Embassy, Berlin.

Report by Consul-General Sir William Ward on Participation in International Exhibitions.

British-Consulate-General,

Hamburg,

February 16th, 1907.

Sir,—In accordance with the instructions conveyed to me by Your Excellency's despatch of the 4th instant, with reference to the inquiries which are being made at present by the International Exhibition Committee in England on the methods and policy pursued in foreign countries in regard to official participation in great International Exhibitions, I have the honour to report as follows:—

There are in the Hamburg district only a very small number of British merchants and British manufacturing firms, and amongst the latter there are only a very few of importance. It is, of course, rather the manufacturers than the merchants who take any direct interest in the question of participation in exhibitions, whether they are of an international, national, or merely of a local character. As far as I am able to ascertain, the British industrial firms established in this district, as elsewhere in Germany, have of late years, upon the whole, become tired of taking part in great exhibitions, owing on the one hand to the very considerable expense which is entailed upon exhibitors thereby, and to the uncertainty, not to say improbability, of the practical results which follow such participation being greater than the expense incurred.

The very high, and often prohibitive, duties imposed in many countries in the world on most manufactured goods are likewise obstacles to the participation of British (and other) manufacturers of the description of the goods in question in large International exhibitions held in such countries. The majority of the public, moreover, which visit large International exhibitions, rarely do so for *business* purposes, and take comparatively slight interest in, and have little knowledge regarding, the industrial products exhibited; but they look chiefly to enjoying the amusements and refreshment arrangements which are provided at these shows.

The kind of exhibition—international, national, or local—which has of late years been—and which continues, it appears, to be—regarded with most favour in this and other countries, and which is considered to offer most chances of success to exhibitors, and show best the progress which has been made in the industries in question, are exhibitions which are confined to *special branches* of industry or art. Some of these Exhibitions—for instance, the German National Exhibition of Machinery, at Dusseldorf, in 1904—have been very successful, both as financial undertakings and for the special branches of German manufacturing industry presented there.

Whilst there appears, as already observed, little or no disposition of late years amongst British manufacturers in this and other parts of Germany to participate in International exhibitions held in this or in other countries, and whilst the participation of British manufacturing firms in a local International Industrial Exhibition, held for instance at Hamburg (or elsewhere in Germany) would hardly contribute towards developing the import trade in British manufactured goods to *Germany itself*, owing to a great degree to the prohibitive German import duties on most manufactures, it should be here observed that there are many descriptions of British manufactured goods, the exhibition of which at Hamburg might very likely lead to the development of the export trade (in such goods) *from Hamburg to other countries.*

The attention of Hamburg export firms would, on such an occasion, be drawn to the suitability and advantages offered by many kinds of British manufacturers, as compared with the same description of goods manufactured elsewhere; and British exhibitors would have an opportunity of arranging with leading "export agents" at Hamburg, with a view to having their goods kept permanently before their notice. It would, indeed, according to my humble opinion, be a very desirable arrangement if, in order to push the export trade in British manufactured goods from Hamburg to oversea countries, a *permanent Exhibition* (or a Commercial Museum) of samples of the British manufactures most suited for such export trade could be established here, so that Hamburg export firms could at all times make their choice by personal inspection of the goods, and have at the same time an insight into description, quality, and prices of the same. Such a permanent Exhibition might well be established by the co-operation of British Chambers of Commerce and other commercial bodies, and industrial British traders and manufacturers interested in the development of British export trade.

In connection with these latter remarks, I may perhaps be permitted finally to remark that, according to my humble opinion, every British manufacturer wishing to do business in any part of the world would do well to have an *agent resident at Hamburg* (and working in commission), whose business it would be to keep the manufacturer well informed as to any inquiries from other countries which would be of interest to the former, and who would also make it his business to call from time to time on the leading exporters of the port. A very large share of all foreign export trade (for instance, to South America, etc.) is at present done through *Hamburg* firms.—I have, etc.,

(Signed) William Ward.

Report by Consul-General Mulvany on Participation in International Exhibitions.

British Consulate-General,
Dusseldorf,
28th February, 1907.

Sir,—In reply to Your Excellency's despatch of the 4th instant, I have the honour to report that there are but few British merchants in this consular district, and that some of them are not in favour of exhibiting as a means of advertising, while others appear to have but little knowledge of the subject in this country, where their industry is not long established; but from one firm in Cologne I hear that they are greatly impressed with the importance of International exhibitions and consider that of all things, as proved by experience, German merchants and manufacturers are likely to avail themselves extensively of the advantages of a British International exhibition, as they did also of exhibitions in America, France, and Belgium. But they state that it would be necessary to approach likely exhibitors in a suitable manner, and by extensive advertisements, with which latter opinion I entirely agree. Your Excellency will be aware that exhibitions so far held in Germany have been of a national or provincial character—for instance, those at Dusseldorf, 1880, and 1902 and 1904, which proved to be in the local interests of the manufacturers, and, indeed, of industry generally in Germany, an immense success. The two former consisted of expositions of industry and fine arts; the latter was international, including only fine arts, horticulture and agriculture. The pictures from Great Britain were selected through the medium of a German committee, and, unfortunately, not from the best British painters, *i.e.*, with few exceptions. In the horticultural and agricultural department, Great Britain did not participate to any considerable extent, whereas France, Belgium, and Holland were extremely well represented.

Germans have certainly recognised the great advantage of this means of making their products and manufactures known before the world. Financially the exhibitions at Dusseldorf yielded a large profit; that of 1902 having a surplus of some £50,000. The town and environs gained also great advantages from the influx of visitors from all parts of the world. And the German industrial men attribute the increase of exports, especially in the iron and steel trade to England, in a great measure to the Dusseldorf Exhibition.

I have the honour to be, etc.,
(Sd.) T. R. Mulvany.

British Consulate-General,
Dusseldorf,
D. 5th March, 1907.
R. 6th March, 1907.

Sir,—I have herewith the honour to confirm my despatch of the 28th ultimo, *re* Exhibition question, and to forward herewith a letter I have since received from the manager of Twyford's works at Ratingen, Dusseldorf, which gives an opinion that may be of interest in this matter, as, of course, it is desirable in an International Exhibition that a careful selection of exhibits be made.

I have the honour to be, etc.,
(Sd.) T. R. Mulvany.

The Right Hon. Sir Frank Lascelles, K.C.B., etc.

(Copy of letter from Twyfords Werke to T. R. Mulvany, Esq.)

Dear Sir,—In reply to your inquiry dated 6th February, I beg to state that, in my opinion, if proper care is taken to select only firms of standing to take part in the British section of an International Exhibition, the result on British trade and prestige in foreign countries will be satisfactory; but it is questionable whether the necessary supervision is always exercised in selecting firms at home. It seems to resolve itself into taking any firm, whether of standing or not, that is willing to go to the expense of taking space. Writer was in the Milan Exhibition last year towards the close, and received a distinctly unfavourable impression of the British section. I found our country represented to a not inconsiderable extent by comparatively unknown firms, and a number of these were engaged in selling 1s. and 6d. "diamond" brooches and scarf-pins to the public. I do not consider exhibitions under such conditions are calculated to increase British prestige to any great extent.

Your obedient servant,
(Sd.) Thomas W. Twyford.

APPENDIX C.

Reports by H.M. Representatives Abroad.

V.—ITALY.

The policy pursued by the Italian Government in respect to participation in International exhibitions held abroad may be summarised as follows:—

In the absence of special political considerations, the Italian Government holds entirely aloof from any participation in exhibitions which are not judged to be of particular interest for Italian industry or agriculture. On the other hand, if invited to participate in an exhibition which, although not of special importance to national production, is yet considered capable of advancing the general economic interests of the country, the Government, without participating officially, gives the undertaking its moral support by spreading notices throughout the country of the proposed exhibition, by publishing the programme and regulations pertaining thereto in its official organs, and, should the number of Italian exhibitors be sufficiently large, by sanctioning the temporary exportation of the goods to be exhibited, and by taking steps to obtain specially reduced transport rates for exhibits both by rail and sea. At times, even a small Government grant may be made, commensurate with the number of Italian exhibitors and the importance of the exhibition.

When, however, an International exhibition is of a universal character, and assumes such importance that the Government considers it advisable to participate officially, Parliament is asked to make a special grant for the purpose of defraying the necessary public expenditure. The amount voted appear in the Budgets of the Ministry of Agriculture, Industry and Commerce, and are generally spread over two or more financial years.

In the course of the last twenty years the Italian Government has officially participated in four great International exhibitions abroad, viz., those of Paris in 1889 and 1900; that of Chicago in 1893; and that of St. Louis in 1904.

The total amounts voted by the Italian Legislature for official participation in the three last-named exhibitions and for the organisation and preparation of exhibits were as follows:—

—	Sums Voted.	Sums Spent.	Sums Economised.
	£	£	£
Chicago Exhibition, 1893	8,800	8,000	800
Paris Exhibition, 1900 -	88,000	76,800	11,000
St. Louis Exhibition, 1904	36,200	35,300	900

The figures relating to the Paris Exhibition of 1889 are contained in State archives, which are not readily accessible.

In the case of the Paris Exhibition of 1900, the preliminary sum voted was £36,000. This amount, however, was increased by subsequent votes to £88,000. The surplus shown of £11,200 was held in reserve, and eventually added to the credit voted for the St. Louis Exhibition of 1904.

The administration of these funds was in each case entrusted to a Royal Commission nominated by the Minister of Agriculture, Industry and Commerce. The Commission held its sittings in Rome, and was presided over by the Minister in person.

The Commissions consisted of representatives of different Government Departments, of Chambers of Commerce, and of various industrial, agricultural, and mining institutions. Further, nominations were given to Members of Parliament, as well as to prominent artists, engineers, and architects.

The executive staffs were elected from among the members of the Royal Commissions, and to these bodies were entrusted the work connected with the organisation and preparation of exhibits. In order to facilitate operations, the executive staffs were divided into a number of small sub-committees, each sub-committee being assigned to particular groups of exhibits.

The Central Commission dealt with the credits voted at its own absolute discretion. Generally speaking, grants were allocated according to the importance of the different groups, and in proportion to the number of exhibitors in each group.

With a view to obtaining representative exhibits, notices were circulated by the central executive staffs among Chambers of Commerce and industrial and agricultural institutions throughout the country. Local committees were then formed, to whom, in the first instance, applications for the acceptance of exhibits had to be addressed. The final right of selection, however, rested with the central executive staff. The system of "collective" or "selected" exhibits seems to have been generally followed, with a view to showing what was best in each branch of industry. In every case the names of the owners or manufacturers of the different exhibits were clearly displayed.

The owners of exhibits were called upon to defray all expenses connected with packing, transport, and insurance. On the other hand, the costs of unpacking, installation, maintenance in repair and repacking were borne by the Commission. Arrangements were made by the Government for enabling exhibitors to obtain specially reduced rates of freight for their goods both by land and sea.

The sale of goods during the exhibitions appears to have been absolutely unrestricted, provided that no exhibit of importance was removed until after the close of the exhibition.

The allocation of the space put at the disposal of the Italian Commissions was made by the central executive staffs as far as possible in proportion to the importance of the various groups of exhibits.

The cost of the principal Italian pavilion at the Paris Exhibition of 1900 amounted to £20,000. For the furnishing and arrangement of the various sections a sum of about £8,000 was expended. These sums included all costs connected with the necessary installations for illumination, motive power, etc. A further sum of about £4,000 was expended on secondary pavilions.

At the close of the exhibition the pavilions were demolished and the sites returned to the exhibition authorities in the same condition in which they were taken over. In accordance with an agreement between the French building contractors and the Italian Commission, the former had right of disposal of all material obtained in the process of demolition. Furniture and fittings, however, were sold for a trifling sum.

The cost of the Italian pavilion at the St. Louis Exhibition of 1904 amounted to £8,000. At the close of the exhibition the pavilion was demolished, and the material obtained from the demolition was assigned to the contractor as compensation for labour.

No statistics are available at the Ministry of Commerce here as to the number of Italian exhibitors in the different groups at the exhibitions of Chicago,

Paris, and St. Louis. Lists, if required, both of exhibitors and awards might doubtless be obtained from the United States and French authorities.

The question as to whether Italian manufacturers are generally willing or not to take part in International exhibitions would appear to depend largely on the reputation and previous record of each individual firm. Business houses whose reputation is firmly established and who have already gained distinctions at previous exhibitions are often reluctant to incur the expense of furnishing further exhibits. On the other hand, manufacturers who are as yet little known are only too glad to avail themselves of the opportunity of advertisement, and of obtaining awards which they hope will afford a guarantee to their customers of the excellence of their productions.

In reply to my question as to what was the opinion of British merchants in Italy with regard to the local effect of exhibitions on British trade and prestige, the following resolution was passed at a recent meeting of the Executive Committee of the British Chamber of Commerce for Italy :—

"The Executive Committee of this Chamber is of opinion that as regards Italy, if the United Kingdom participated officially and *adequately* at great International exhibitions, the local effect on British trade and prestige would undoubtedly be good.

"This Committee considers that it would be advantageous if local resident British merchants were strongly represented on every official Exhibition Commission, as they are in the best position to know the requirements of the country in which they reside and trade, and would be qualified to guide and advise British exhibitors, as well as to make arrangements locally with the authorities and others."

As far as I have been able to ascertain, it is not proposed to hold any great International exhibition in Italy in the near future.

I enclose for the information of the International Exhibition Committee a copy of the law, decrees, and regulations for the Italian section at the International Exhibition of Paris of the year 1900. This work contains much detailed information on the various points formulated by the Committee, and may be found convenient for reference.

A. Percy Bennett.

Rome, March 29th, 1907.

APPENDIX C.

Reports by H.M. Representatives Abroad

VI.—SWITZERLAND.

Question 1.—Quels sont les principes observés par le Gouvernement suisse pour l'acceptation d'invitations à participer officiellement à des expositions internationales?

Réponse.—Lorsque la Suisse est invitée par un Gouvernement étranger à prendre part officiellement à une exposition internationale, le Conseil fédéral, soit son Département du commerce, fait procéder, par l'organe des Gouvernements cantonaux, des grandes associations industrielles, commerciales et agricoles, et des Commissions spéciales, à une enquête ayant pour but de fournir des renseignements précis sur les dispositions qui règnent dans les sphères intéressées du pays au sujet de la participation à l'entreprise projetée et sur la question de savoir si l'on pourrait compter sur un concours suffisant des diverses branches de l'activité nationale.

Les résultats de cette enquête servent de base au Conseil fédéral pour prendre attitude. Si cette autorité considère que les circonstances permettent d'accepter l'invitation, la question est portée, par un message spécial, devant l'Assemblée fédérale qui est seule compétente pour prendre une décision définitive et pour accorder le crédit qui sera affecté à l'organisation officielle de la participation suisse et aux dépenses de divers ordres que la Confédération prendra à sa charge afin d'alléger les exposants.

Question 2.—Quelles sont les expositions auxquelles la Suisse a participé pendant les vingt dernières années?

Réponse.—La Suisse a participé officiellement aux expositions suivantes:—

Exposition universelle de Paris en 1889.
Exposition universelle de Chicago en 1893.
Exposition universelle de Paris en 1900.
Exposition internationale de Milan en 1906.

Pendant la même période, des industriels suisses ont pris part, généralement en très petit nombre, à d'autres expositions internationales, p. ex. Barcelone, Bruxelles et Melbourne en 1888, Anvers et Lyon en 1894, Bordeaux en 1895, Bruxelles en 1897, Liège en 1905; mais ils l'ont fait à leurs frais, périls et risques, et sans le concours ni l'intervention des autorités fédérales.

Question 3.—Quelle est l'importance de sommes allouées, dans chaque cas, par l'autorité suisse pour la participation, la préparation et l'organisation officielles et quel est le montant réellement dépensé?

Réponse.—Pour l'Exposition universelle de Paris en 1889:—

Crédits alloués, f.600,000; sommes dépensées, f.604,457.15; l'excédent de dépenses s'élevant à f.4,457.15 a été également supporté par la Confédération.

Pour l'Exposition universelle de Chicago en 1893:—

La participation officielle de la Suisse a été limitée à l'horlogerie et à la sculpture sur bois; mais la Confédération a envoyé à Chicago un certain nombre de délégués pour étudier l'exposition dans son ensemble. Les crédits alloués par les Chambres fédérales se sont élevés à f. 275,000, somme qui a été totalement dépensée.

Pour l'Exposition universelle de Paris en 1900:—

Crédits alloués, f.1,650,000. Dépenses réelles f.1,520,131.53.

Pour l'Exposition internationale de Milan en 1906:—

Crédits alloués, f.600,000. La dépense réelle n'est pas encore connue.

Divers cantons, tels que Berne, Vaud, Neuchâtel, Genève, etc., ont en outre voté des subsides destinés à réduire dans une certaine mesure les dépenses restant à couvrir par leurs propres exposants en sus de celles que la Confédération avait prises à sa charge.

Question 4.—Par quelles corporations ou organisation les crédits ont-ils été accordés, dans chaque cas?

Question 5.—Quelle est la composition de ces corporations et par qui sont-elles nommées?

Réponse aux Nos. 4 *&* 5.—Les crédits sont alloués par l'Assemblée fédérale (Conseil national et Conseil des Etats).

Question 6.—Quelles sont les règles suivies pour la fixation des principaux postes de dépense et quel a été le motant fixé pour les principales industries ou les groupes d'industries les plus importants?

Réponse.—La Confédération prend à sa charge pour la participation officielle de la Suisse à des expositions internationales, les frais suivants:—

(a) D'Administration et notamment de la commission centrale, du commissariat général, des commissions spéciales, des experts et du jury.

(b) Des expositions préalables.

(c) Des imprimés de toute espèce, du catalogue, du rapport administratif et des rapports techniques.

(d) De transport, depuis les lieux de dépôt en Suisse, qui seront désignés, jusqu'à l'exposition et retour à la station de départ pour tous les objets à exposer arrivés, en temps voulu, sur les lieux de dépôt, ainsi que pour les vitrines admises par le commissariat général, y compris les produits dont la nature exige le transport par grande vitesse. La Confédération prend, en outre, à sa charge les frais de transport des objets qui doivent figurer à l'exposition des beaux-arts, même s'ils sont expédiés de stations situées hors de Suisse.

(e) Des constructions nécessaires dans les divisions suisses, du revêtement des parois et plafonds, de l'installation des cloisons, podiums, tableaux indicateurs des groupes, décorations générales, des travaux de fondation pour les machines, des conduites de raccordement pour la vapeur, le gaz et l'eau et des conduites pour la force électrique.

(f) Du déballage et du reemballage des objets, ainsi que de l'emmagasinage des caisses.

(g) De l'installation des objets exposés, de la surveillance et du bon entretien des objets exposés et du mobilier de l'exposition en tant que ce service n'exige pas des connaissances spéciales et professionelles.

(h) Du transport aller et retour des animaux vivants depuis la station de chemin de fer la plus rapprochée du domicile de l'exposant jusqu'à l'exposition; des frais d'accompagnement, d'entretien, de soin et de nourriture des animaux pendant leur transport et la durée de l'exposition.

(i) D'assurance de transport depuis les dépôts jusqu'à l'exposition et retour, d'assurance contre l'incendie, le vol et tous les risques pendant la durée de l'exposition, de l'assurance des animaux vivants contre tout dommage pendant le transport et l'exposition du bétail.

(k) Le surcroît de frais qui serait occasionné aux exposants par suite d'arrangements collectifs dans les groupes ou subdivisions particuliers, ainsi que le montage des machines jusqu'à concurrence de la somme totale prévue au budget pour ces dépenses.

Tous les exposants, quel que soit le groupe l'industrie auquel ils appartiennent, sont placés, à l'égard de ces avantages, sur un pied de parfaite égalité.

Le projet de budget des frais qui incomberont à la Confédération est établi non pas par industries ou

groupes d'industries, mais par catégories de dépenses en tenant compte, pour les évaluations, des expériences déjà faites dans de précédentes expositions, de l'importance de la participation suisse à la nouvelle entreprise en ce qui concerne le nombre des exposants, la quantité et la valeur des produits qu'ils y feront figurer, etc.

A titre d'exemple, voici le projet de budget pour la participation suisse à l'exposition universelle de Paris en 1900.

	Compte de 1889.	Budget pour 1900.
	Fr.	Fr.
1. Administration générale avant l'ouverture de l'exposition	51,312·02	126,000
2. Administration à Paris	57,857·34	90,000
3. Jury international	52,247·71	60,000
4. Catalogue	3,312·06	5,000
5. Assurance de transport et assurrance contre l'incendie	25,241·35	40,000
6. Installation, montage	23,614·09	95,000
7. Service de sûreté	35,162·70	60,000
8. Emmagasinage des caisses	9,443·05	15,000
9. Emballage pour le retour	12,342·05	25,000
10. Exposition des beaux-arts	14,458·22	30,000
11. Exposition d'animaux vivants	31,833·—	100,000
12. Exposition laitière	——	
13. Constructions :		
(*a.*) Honoraires, salaires, constructions	132,614·41	320,000
(*b.*) Fondations de machines, conduites, etc.	11,787·38	140,000
(*c.*) Vitrines et décorations	7,666·99	200,000
14. Frais de transport	85,969·96	210,000
15. Collections	13,974·50	20,000
16. Rapports	20,155·50	30,000
17. Divers et imprévu (expositions centennales)	10,445·62	84,000
En chiffres ronds	600,000	1,650,000

Comme cela est indiqué dans la réponse à la Question 3, les dépenses réelles ne se sont élevées qu'à f.1,520,131.53, restant ainsi de f.129,868.47, inférieures aux previsions.

Question 7.—Quelle a été la composition des organes chargés d'organiser et de préparer la participation ?

Réponse.—Dans la plupart des cas, les organes suisses aux expositions universelles sont : une commission centrale, les commissions spéciales nécessaires et les experts, les membres du jury et un commissariat général. La commission centrale est nommée par le Conseil fédéral qui tient compte, dans ses choix, les différentes branches de production participant à l'exposition. Elle est présidée par le chef du Département fédéral du Commerce, de l'Industrie et de l'Agriculture. La commission centrale donne son avis sur toutes les questions de principe qui lui sont soumises par ce Département ou par le commissariat général. Elle fait au Département des propositions pour le choix des experts, des commissions spéciales et commissaires spéciaux, ainsi que pour la nomination des membres suisses du jury international.

Elle statue comme tribunal arbitral et tranche en dernier ressort tous les différends qui naîtraient entre les exposants et le commissariat général.

Les commissions spéciales, commissaires spéciaux et experts sont nommés par le Département fédéral du Commerce, de l'Industrie et de l'Agriculture sur la proposition de la commission centrale. Ceux-ci ont essentiellement à conseiller et à soutenir le commissariat général, notamment dans ses relations avec les exposants, pour la répartition de l'espace entre eux, pour l'examen ou l'exposition préalable des objets présentés, pour le réception et l'installation de ces objets à l'exposition même, pour la répartition des frais éventuels à la charge des exposants ou des subsides à leur allouer, etc.

Les membres suisses du jury international sont désignés par le Conseil fédéral sur la proposition de la commission centrale.

Le commissaire général suisse, cas échéant son suppléant, et le secrétaire général sont également nommés par le Conseil fédéral.

Le Commissaire général représente les autorités et les exposants suisses vis-à-vis du gouvernement et du commissaire général du pays où a lieu l'exposition, ainsi que des commissaires généraux des autres Etats.

En dehors re l'administration générale, le commissaire général est spécialement chargé :—

(a) De l'élaboration de tous les projets et propositions à soumettre à la commission centrale ; de l'établissement des devis.

(b) De l'administration financière et du rapport final administratif et financier.

(c) Des relations avec les exposants.

(d) De la division des exposants et de la répartition entre eux de l'espace obtenu.

(e) De toutes les mesures concernant le mobilier, les décorations et l'installation individuelle ou collective des objets exposés.

(f) D'ordonner les expositions préalables.

(g) De la réception, expédition, assurance et réexpédition des objets exposés, de leur déballage, installation et réemballage en tant que les exposants ne désirent pas s'en charger aux-mêmes à leurs propres frais, en observant à cet égard des prescriptions reçues.

(h) De la surveillance des objets exposés, ainsi que

des soins nécessaires pour pouvoir, dans la mesure du possible, à leur protection et conservation.

(i) De la comptabilité et de la perception des frais incombant aux exposants.

(k) Des contributions au catalogue général et de l'élaboration d'un catalogue spécial suisse en une ou plusieurs parties.

Question 8.—Quelle somme a coûté le Pavillon de chaque exposition et quel a été le produit de sa vente après la clôture de l'Exposition?

Réponse.—La Suisse n'a jamais contruit de Pavillon spécial où auraient été réunis en un seul tout les objets qu'elle exposait. Ceux-ci ont été chaque fois placés dans les divisions générales de l'Exposition auxquelles ils appartenoient par leur nature et par leur genre.

Question 9.—Quelles ont été les méthodes employées par les organes d'exécution pour obtenir les objets exposés par chaque industrie et les règles suivant lesquelles ces objets ont été acceptés?

Question 10.—Les organes exécutifs exerçaient-ils un droit quelconque en ce qui concerne le choix des objets offerts, ou bien toutes les personnes désirant exposer étaient-elles traitées de la même manière, quelle que fût la valeur on l'utilité de leurs marchandises? En d'autres termes, les organes exécutifs organisaient-ils une exposition collective, c'est-à-dire une exposition de choix à seule fin de présenter ce qu'il y avait de mieux dans chaque branche ou industrie, ou admettaient-ils pour l'exposition les marchandises similaires de divers degrés de qualité, de fabrication et d'achèvement de toutes les personnes ou raisons sociales qui désiraient être représentées?

Réponse aux Nos. 9 *et* 10.—Au cours de l'enquête mentionnée dans la réponse au chiffre 1, les personnes, raisons sociales, etc., disposées à prendre part à l'exposition, indiquaient dé jà la nature et le genre des produits qu'elles avaient l'intention d'y faire figurer.

En règle générale, les objets annoncés ne sont acceptés qu'après examen préalable par des experts spéciaux.

Des expositions collectives se composant uniquement d'objets choisis par des experts ont été organisées:—

A Paris, 1889, pour les Beaux-arts, l'Horlogerie, les Gazes pour bluteries, les Vins et les Animaux vivants.

A Chicago, 1893, pour l'Horlogerie et la Sculpture sur bois.

A Paris, 1900, pour l'Horlogerie, les Peintures sur émail, les Vins, les Fromages.

A Milan, 1906, pour l'Horlogerie, les Vins, les Fromages, les Animaux vivants.

Question 11.—Dans les expositions collectives, les noms des propriétaires ou des fabricants étaient-ils appliqués sur chaque objet d'une façon bien visible?

Réponse.—Oui.

Question 12.—Quels arrangements ont-ils été pris avec les propriétaires des marchandises en ce qui concerne.—

(a) L'emballage;

(b) Le transport et l'assurance;

(c) L'installation et l'entretien;

(d) La représentation des raisons sociales individuelles dont les marchandises faisant partie des expositions collectives;

(e) La vente des marchandises pendant l'exposition;

(f) Le réemballage et la réexpédition des marchandises après la clôture de l'exposition?

Réponse.—ad a:—Pas d'arrangements spéciaux; l'emballage a toujours été à la charge des exposants.

ad b:—Les frais de transport et d'assurance ont toujours été supportés par la Confédération (*voir* litt. *d* et *i* de la réponse à la question 6).

ad c:—L'installation des objets exposés était à la charge de la Confédération; de même leur entretien s'il n'exigeait pas des connaissances spéciales et professionnelles; dane ce cas, par exemple pour l'horlogerie, la bijouterie, les boîtes à musique, la sculpture sur bois, etc., les exposants devaient y pourvoir eux-mêmes ou par des agents à leur solde *voir* litt. *g* de la réponse à la Question 6).

ad d:—Les maisons exposant individuellement dans les collectivités devaient désigner elles-mêmes leurs représentants. Ceux-ci étaient seuls responsables vis-à-vis d'elles, mais ils étaient tenus de se conformer, en ce qui concerne le service, aux ordres des commissaires officiels suisses.

ad e:—Aucune prescription n'a été établie par la Confédération au sujet de la vente des marchandises; les exposants pouvaient donc, sous leur pleine et entière responsabilité, en confier le soin à des agents qu'ils rétribuaient eux-mêmes; mais la vente ne pouvait, cela va sans dire, s'effectuer que dans les conditions et sous les réserves fixées par les règlements généraux ou les dispositions spéciales émanant des autorités du pays où avait lieu l'exposition.

ad f:—Le réemballage et la réexpédition des marchandises après la clôture de l'exposition ont eu lieu aux frais de la Confédération (*voir* litt. *d* et *f* de la réponse à la Question 6).

Il parait utils d'ajouter ici, à titre de renseignement, en ce qui concerne les frais de transport des objets destinés à une exposition à l'étranger, que la Confédération paie aux chemins de fer suisses la taxe pleine pour l'aller et que, pour le retour, ceux-ci transportent en franchise toutes les marchandises qui, n'ayant pas été vendues à l'exposition, rentrent au pays après sa clôture.

Question 13.—Par qui les frais d'administration étaient-ils payés et quelle était la part à supporter éventuellement par les propriétaires des objets exposés?

Réponse.—La totalité des frais d'administration ont été payés par la Confédération (*voir* litt. *a* et *c* de la réponse à la Question 6).

Question 14.—Quels ont été les principes suivis par le comité d'organisation pour l'attribution des emplacements:—

(*a*) à chaque groupe d'exposants,

(*b*) aux exposants individuels?

Réponse. — L'attribution des emplacements aux groupes d'exposants et aux exposants individuels n'a pas été et ne pouvait être faite d'après des principes déterminés. Les Commissaire et experts à qui cette tâche incombait (voir le 4e alinéa de la réponse à la Question 7), ont dû, dans chaque cas, tenir compte, d'une part, des circonstances spéciales, telles que dimensions, situation, sécurité offerte par les divers emplacements mis à la disposition de la Suisse dans les différentes parties de l'exposition; d'autre part, de la nature, de l'espèce, de la quantité, de la valeur, etc., des marchandises qui devaient y être installés. L'horlogerie, la bijouterie, les œuvres d'art et les autres objets précieux, par example, exigeaient des locaux fort bien construits et présentant, d'une-maniere générale, toutes les garanties désirables contre les dangers d'incendie, d'effraction, etc., tandis que pour des produits d'autres catégories, tels que les machines de tout genre, ces conditions-là n'étaient pas requises au même degré.

Question 15.—Quel a été le nombre total des exposants suisses dans chaque groupe et quelle a été la proportion de leurs récompenses par rapport à celles des exposants d'autres nationalités dans les même groupes?

Réponse.—Les tableaux ci-après indiquent le nombre total des exposants suisses dans chaque groupe et celui des diverses récompenses qui leur ont été décernées. Quant à la proportion entre les récompenses aux exposants suisses et à ceux d'autres nationalités, elle n'a pas été établie.

Question 16.—Les fabricants suisses participent-ils volontiers ou à contre-cœur aux expositions internationales?

Question 17.—Quelles sont les raisons que l'on fait généralement valoir :—

(*a*) pour, ou

(*b*) contre la participation aux expositions internationales?

Réponses aux Nos. 16 *et* 17.—On considère partout en Suisse que les expositions internationales sont trop nombreuses et se suivent à des intervalles trop rapprochés. Elles provoquent ainsi, au sein des sphères industrielles et agricoles, une lassitude générale, et, par suite de leur fréquence, leur utilité pratique est mise en doute.

Cependant les quelques industries qui ont la per-

spective de pouvoir vendre leurs produits à l'exposition (horlogerie, bijouterie, fromages) ou d'y prendre des commandes (machines), acceptent avec assez de facilité l'invitation à y participer; quant aux autres branches de la production nationale, elles ne s'y décident, la plupart du temps, que guidées par des motifs d'intérêt national et en vue de contribuer à maintenir les bons rapports internationaux existant entre la Suisse et les autres pays.

Question 18.*—(Le texte de ce numéro est biffé sur le questionnaire reçu.)

Question 19.—A-t-on l'intention d'organiser en Suisse, dans un avenir prochain, une grande exposition internationale et, dans l'affirmative, où doit-elle avoir lieu?

Réponse.—On n'a pas l'intention d'organiser prochainement en Suisse une exposition internationale.

---

* NOTE.—Question 18 was not submitted to the Swiss Government, as it relates to the views held by British Chambers of Commerce and British Manufacturers. The proper answer according to Mr. Milligan, British Vice-Consul at Zurich, and until recently British Commercial Agent in Switzerland, is as follows:—"There are no British Chambers of Commerce in Switzerland, and British Trade has not derived any benefit from Exhibitions in Switzerland not having been represented at such Exhibitions. *See* despatch No. 23 Committee.

APPENDIX C.

Reports by H.M. Representatives Abroad.

VII.—UNITED STATES OF AMERICA.

During the last twenty years the United States Government have officially been represented in the following exhibitions:—

Melbourne	1888
Brussels	1888
Paris	1889
Brussels	1897
Paris	1900
Liége	1905

The appropriations granted for each of these were respectively $50,000, $30,000, $250,000, $5,000, $1,397,500, and $5,000.

The participation of the United States Government in any exhibition depends upon the action of Congress in whose hands rests the question as to what sum, if any, shall be appropriated for the purpose. When an invitation to participate in an international exhibition is received at the State Department, and the executive authorities of the Government consider that it is desirable the United States should be officially represented, the necessary papers are laid before Congress, generally with an estimate of the sum required. This estimate is liable to be much reduced by Congress, which has not perhaps been inclined to be very generous, with the notable exception of the appropriation granted towards the Paris Exhibition of 1900. The expenditure of the appropriation is generally under the direct control of the Chief Commissioner, the Acts of Congress usually only specifying what sums shall be devoted to the salaries of the Commissioners, etc., leaving the apportionment of the money amongst the different groups in the hands of the advisers of the Commissioners.

In no country are the sweet uses of advertisement better appreciated than in the United States, and American manufacturers are, generally speaking, not slow to avail themselves of the opportunity which an international exhibition affords them of making their products more widely known. This applies more particularly to those manufacturers who have already established an export trade, or to those who see a chance of introducing their goods into European countries. Such manufacturers regard an exhibition as a first class business proposition, and do not grudge the expense of setting up an exhibit, considering that they will be well repaid by an increase of orders from abroad. The United States Commission therefore can always reckon on receiving an enormous number of applications for space from such firms, and, were it not for the fact that the object aimed at by national participation in an exhibition is the adequate representation of the country in every branch of industry, the task of the Commission would be relatively light. But a perusal of the Commissioners' reports for the various exhibitions shows that it is by no means easy to arouse the interest of those manufacturers whose goods are not in the market abroad, or who would have to face strong European competition. The Director of the Department of Textiles, for example, in the Paris Exhibition of 1900 makes the following statement in his report:—

> "The indifference of textile manufacturers towards exhibiting is most pronounced, as the industries embraced in this Department largely form the manufacturing strength of the great European countries, and to seek trade in Europe in this line was considered like carrying coals to Newcastle. Consequently it appeared almost impossible to divert attention from filling orders at home to preparing an exhibit from which no benefit could result."

In an international exhibition, however, the credit of the United States largely depends on the country making a good showing in all the different Departments, and the various Commissions have generally succeeded in securing the co-operation of reluctant firms to a satisfactory degree. In the case of the Paris Exhibition of 1900, where a generous appropriation made it possible for the Commission to organise its efforts to the best advantage, a special Department was formed which devoted its energies to the work of stimulating the zeal of manufacturers. This Department obtained the co-operation of many firms who, had the question been left to their own initiative, would never have exhibited. It was pointed out to those manufacturers who were reluctant to compete with their European rivals, that the high quality of American goods could beat European produce in its own ground, and that as "few Americans realise the pre-eminence of America, and foreigners know it less," it was both their duty and to their advantage to exhibit. Such appeals to their patriotism and to their speculative instincts seems generally to have had a good effect.

Reluctance to exhibit, particularly among the leading manufacturers, was often due to business prosperity. It is indeed natural enough that a manufacturer who has made his name and whose goods are in great and constant demand, should think twice before undertaking the costly trouble of preparing a suitable exhibit when his factory is already taxed to its utmost extent in endeavouring to meet the orders flowing in upon it. Much difficulty was experienced on this score by the various Commissions; even in those classes where there were received overwhelming numbers of applications for space, it was found that such applications came in great part from firms of indifferent standing, while the leading producers were but poorly represented. In these cases special appeals were generally made by the Commissioners to the great firms, usually with satisfactory results.

There is no doubt that British trade and prestige can be materially advanced by participation in American exhibitions. Though the high tariff is in some respects a great hindrance to British imports, yet English manufacturers supply large quantities of high-grade goods to the United States which are at present not produced in the country itself. They are even able to compete to a considerable degree with American manufacturers on their own ground. On the whole British firms have been poorly represented in American exhibitions, which would seem to be regrettable in view of the fact that in spite of the tariff wall, British imports into the United States were in 1906 21 per cent. higher in value than in 1905, and 39½ per cent. higher than those of 1904.

Melbourne, 1888.

To meet the cost of the representation of the United States at this exhibition, Congress appropriated the sum of $50,000, to be expended at the discretion of the Secretary of State.

The United States was represented by a Commissioner, who had under him six Assistant Commissioners, of whom two were honorary, the American Consul-General at Melbourne, who was named Commissioner ex officio, and an officer of the United States Navy, who acted as Secretary and Disbursing Officer.

Of the appropriation, $20,000 were reserved by the Department of State for the remuneration of the Commissioners and for contingencies, the remaining $30,000 being at the disposal of the Commission.

It is obvious that with such a small sum at their command the Commission could not attempt anything on a very large scale. Valuable assistance was, however, rendered to American exhibitors, and, though no special United States building was erected, much was done in the way of construction and decoration in the various sections. The work of the Commission was performed in an economical manner. The total surplus remaining unexpended out of the appropriation, including the sum of $3,500 originally set apart by the State Department for contingencies, amounted to something over $12,000. Included also in this surplus is a sum of $1,150, which was realised at a sale of Government property after the exhibition had closed.

For the purpose of supplying information to intending exhibitors, offices were established at Washington and San Francisco, where applications for space were received. The exhibition authorities were at first

unable to provide all the space applied for by exhibitors from the United States, but finally the erection by the Melbourne officials of annexes increased the floor space sufficiently to meet the demand.

The funds at the disposal of the Commission were not ample enough to enable them to defray the expenses of transport, which were mostly borne by the exhibitors themselves, but the Commissioner was authorised to give assistance in a limited number of cases. The Commission was able to provide labour and bear some of the expenses of installing exhibits in the exhibition building and of removing them therefrom.

The number of exhibitors from the United States, arranged in groups, was as follows:—

Group	I. (Works of art)	7
,,	II. (Education, etc.)	41
,,	III. (Furniture, etc.)	40
,,	IV. (Glass and pottery)	3
,,	V. (Textiles)	22
,,	VI. (Raw and manufactured produce)	42
,,	VII. (Machinery)	136
,,	VIII. (Alimentary products)	25
,,	IX. (Sanitary and surgical appliances)	12
,,	X. (Agriculture)	1
,,	XI. (Horticulture)	2
,,	XII. (Mining industries)	8
	Total	339

American exhibitors received 222 awards, of which 114 were of the first order of merit, 58 of the second, 36 of the third, and 14 honourable mentions.

Brussels, 1888.

This exhibition, which was at first a private enterprise, was taken up officially by the Belgian Government at such a late date that by the time Congress had made an appropriation of $30,000 and a Commissioner had been appointed by the President, there only remained three weeks before the opening of the exhibition. Naturally, therefore, there was no time for the Commissioner to do much in the way of collecting or transporting exhibits from America. The approaching exhibition at Paris in 1899 also had a discouraging influence, with the result that exhibitors from the United States only numbered 74. Of the sum appropriated by Congress, but $17,113 were spent.

Paris, 1889.

By a joint resolution, approved May 10, 1888, Congress authorised the participation of the American Government in the exhibition to be held at Paris from May to October, 1889, and appropriated the sum of $250,000 to cover all expenses. The resolution directed the President to appoint, with the consent of the Senate, a Commissioner General, who should, under the general direction of the Secretary of State, represent the United States at the exhibition and control all the necessary expenditures and arrangements. Provision was also made for an Assistant Commissioner General, and nine scientific experts, likewise to be appointed by the President, who were assigned to the nine groups in which the exhibition was officially divided. The remuneration, payable out of the appropriation to the above-mentioned members of the staff, was laid down in the resolution, as also an allowance for clerk hire, as follows:—

Commissioner General	$10,000
Assistant Commissioner General	5,000
Scientific experts, at $1,500	13,500
Clerical service	15,000

The last item coverd the salary of a Secretary, who was appointed by the Commissioner General. A Chief Engineer was also appointed, who had charge of the distribution of the spaces to be allotted to the various exhibitors, and, in general, of all the details connected with the setting up and care of the exhibits.

According to the terms of the resolution, circulars were sent by the Secretary of State to the Governors of the various States and Territories, inviting them to participate, but the result was discouraging, and, with one or two small exceptions, no State or Territory made any exhibit.

No special American building was erected, as the amount of the appropriation did not justify the expenditure, nor could a proper site for the erection of such a building have been obtained at the late date of the acceptance of the invitation. There was no special collective American exhibit made by the United States, with the exception of that arranged by the Department of Agriculture, which will be dealt with later on.

For these reasons, the work of the Commission was mainly occupied with the distribution of information, the allotment of spaces to the exhibitors and the transmission of the exhibits to Paris.

An office was opened in New York, where the work of advertising, distributing information, sending agents to induce manufacturers to make exhibits, and, in some cases, to procure exhibits by purchase when they could be obtained in no other way, was carried on till all the exhibits had been collected and shipped to Paris.

Applications for space were referred to committees appointed by the Commissioner General. There was one committee for each class, also nine group committees and a committee of revision, the members of all these being men selected for their intimate knowledge of the subjects dealt with by the committee to which they were assigned. Great difficulty was met with in granting allotments owing to the excessive number of applicants. No charge was made for the spaces granted nor had the applicants to deposit a sum to be forfeited if they broke their agreements with the Commission, measures which the Chief Engineer recommends in his report, with the result that many firms had no compunction in withdrawing at the last moment, leaving spaces unfilled which need never have remained vacant. Some of these spaces were filled by exhibits that were offered later in Paris, but it was not always possible to obtain articles belonging to the same class as those for which the space had originally been awarded.

The Commission had very little money to devote to the necessary constructions and general decorations, and no funds at all to apply to the installation and adornment of individual exhibits. Each firm was therefore left at liberty to arrange its exhibit according to its own plans without any attempt being made to secure uniformity in construction and decoration.

The whole business of transport was attended to by the Commission, which forwarded all American manufactures and goods destined for exhibition free of charge from New York to the exhibition and back again from Paris to New York. The carriage of goods from any town of the United States to New York had to be paid for by the exhibitors themselves. 4,533 packages in all were shipped by the Commission from New York to the exhibition, at the cost of $26,026. The number of packages returned to the United States was 2,072, the difference being accounted for by the sales and donations of exhibits at Paris. It is a striking testimony to the efficiency of the transport service that out of the large number of cases shipped to Paris only two were lost.

The cost of unpacking and repacking goods was borne by the exhibitors, whose representatives were expected to provide the necessary labour, but in some cases where these had no agents on the spot the work was done by employees of the Commission and any expense incurred was charged to the manufacturers.

The Commission, while taking all reasonable precautions for the preservation of the exhibits, was not held liable for loss or damage to the goods either in transportation or while on exhibition. Insurance was at the option and cost of the exhibitors.

Special mention should be made of the exhibit prepared by the Department of Agriculture.

The resolution authorised the Commissioner of Agriculture to "collect and prepare suitable specimens of the agricultural products of the several States and territories of the Union." Out of the appropriation granted by Congress towards the general expenses of the American sections of the exhibition the State Department decided that a sum of $38,000 should be assigned to the Agricultural exhibit. As will be seen from the detailed list of the expenditures, the cost of this exhibit was well within the allowance.

The Department of Agriculture appointed a representative in charge to prepare the exhibit, and a board was formed to consider and decide all questions relating to it. The work of collecting and preparing material was sub-divided into twelve branches—grains, forestry, meat products, etc.—and special agents were appointed, one or more to each branch, who travelled about the country collecting material and furnishing information to intending exhibitors. The exhibit was a "collective" one, but the name and locality of the exhi-

bitor was plainly affixed to every article shown, and appeared as well in the official catalogue. All exhibits were transported to Paris, cared for, and returned free of charge.

The total number of exhibitors in the United States sections of the exhibition, arranged in groups, is as follows:—

Group	I. (Works of art)	253
,,	II. (Education)	544
,,	III. (Furniture)	90
,,	IV. (Textiles)	60
,,	V. (Mining industries)	234
,,	VI. (Mechanical industries)	262
,,	VII. (Food products)	15
,,	VIII. (Agriculture)	44
,,	IX. (Horticulture)	5
Social Economy Section		31
Total		1,676

The total number of awards granted to United States exhibitors amounted to 1,044; of these 55 were grand prizes, 214 gold medals, 300 silver medals, 246 bronze medals, and 229 honourable mentions. The grand total of awards granted to competitors of all nations was 32,449 out of a number of exhibitors amounting to something over 60,000. From these figures it would appear that the percentage of awards gained by United States exhibitors was above the average as compared with those gained by the manufacturers of other nations.

The expenditures of the Commission have been classified as follows:—

Services of Commissioner-General	$10,000.00
,, Assistant-Commissioner-General	5,000.00
Nine scientific experts	13,500.00
Secretary and clerks to experts	11,016.93
Engineers, superintendents of sections, and skilled labour	17,597.90
Jurors	7,200.00
Watchmen, etc.	7,008.44
Clerk hire in New York, Paris, etc.	18,295,31
Expenses of New York and Hartford offices	2,475.72
,, Paris office	7,633.95
Postage	1,925.24
Stationery and printing	4,806,05
Advertising	1,349.95
Outward freight expenses	32,146.51
Inward ,, ,,	16,005.44
U.S. Government exhibits	5,413.69
Fine Arts section	3,420.31
Educational ,,	2,665.44
Industrial ,,	16,923.89
Machinery ,,	9,526.91
Agricultural ,,	35,969.69
Preparation of report	12,646.10
Miscellaneous	7,472.53
Total	$250,000.00

Brussels, 1897.

The Department of State asked for a grant of $35,000 towards the expenses of this exhibition, but Congress only appropriated $5.000.

Two Commissioners were appointed by the Secretary of State.

The small appropriation confined the Commissioners to the work of propaganda. This was carried out very systematically. Special Consular reports were obtained showing on what lines United States trade with Belgium was decreasing and increasing, and what manufactures and products would find favourable openings. On the basis of these reports circulars were prepared and sent out to all firms which might be expected to reap the most advantage commercially from the exhibition. Circulars were also sent to the Boards of Trade and other commercial organisations in the great manufacturing centres. The Press generally and trade journals in particular were supplied with circulars and special news items.

There were about 200 United States exhibitors, who obtained the following awards:—6 grand prizes, 6 diplomas of honour, 25 gold medals, 33 silver medals, 31 bronze medals, and 21 honourable mentions.

The whole appropriation was expended, and the Commissioners paid out of their own pockets something under $100 which were spent in excess of the sum granted by Congress.

Paris, 1900.

Appropriations.

The first appropriation made by Congress amounted to $650,000. This sum had been settled upon after a preliminary visit to Paris of a Special Commissioner, who, immediately on Congress sanctioning the acceptance of the invitation to participate in the exhibition, had been sent thither to ascertain the amount of space which would be granted to the United States, and to form an estimate of the cost of representation. It was found, however, that the amount of space which this Commissioner had obtained from the exhibition authorities was entirely inadequate. It was also learnt that it was the intention of most Governments to erect special national buildings, a fact which seems not to have been ascertained at first. Much negotiation with the authorities then ensued, with the result that the amount of space granted to the United States was increased by about 70 per cent. A revised estimate was then drawn up by the Commission which had been appointed by the first Appropriation Act, and submitted to Congress. The Commission had already had time to estimate what sum should be apportioned to each group of industries. Each director at the head of a group of exhibits submitted an estimate of what should be expended on his department. These estimates were compared and revised by the Director-in-Chief of Exhibits and the Director of Affairs. Finally the estimates were approved by the Commissioner-General. The application to Congress was based on these estimates and on the necessity of providing additional grants to meet the expenses entailed by the increase of space awarded and the erection of a National Pavilion. Eventully Congress granted an appropriation amounting to the large sum of $1,397,500 (£279,500).

Out of this sum certain amounts were to be devoted to specific purposes. Besides the remuneration of the members of the Commission and of the jurors, it was stipulated in the Act of Appropriation that a sum not exceeding $150,000 should be devoted to the agricultural exhibit, $120,000 to clerk hire, $296,500 for buildings and constructions, and $15,000 for a negro exhibit. For the rest, the general control of the expenditure of the balance was in the hands of the Commissioner General, but it was the Disbursing Officer who was directly responsible for payments made. His returns of expenditure, made quarterly, were submitted to the State and Treasury Departments for approval.

United States Commission.

The Commission consisted of a Commissioner General, an Assistant Commissioner General, a Secretary who acted as Disbursing Officer, and nineteen Commissioners. All of these were appointed by the President. The terms of service of the Commissioner General, Assistant Commissioner General and Secretary were not to exceed three years, and their salaries were fixed at $8,000, $6,000 and $4,500 respectively. The other Commissioners were appointed for one year, 1900, and received $3,000 each.

There were further appointed, by the Commissioner General, ten Directors, among whom was distributed the supervision of the eighteen groups in which the exhibits were officially divided. Eight Assistant Directors were also appointed. In addition, the staff comprised Directors of Affairs, of Customs, and of Decorations.

Separate State Commissions.

Invitations sent to the Governors of the various States and Territories met with a heartier response than was the case with the Paris Exhibition of 1889. Commissions were appointed by thirteen States, five of which made appropriations ranging from $250 to $130,000. Under the exhibition regulations collective State exhibits were impossible. The State Commissions therefore devoted most of their efforts to generally assisting the United States Commission and co-operating with the latter's work of collecting exhibits.

Work of the Department of Exploitation.

The duty of distributing information to intending exhibitors, collecting exhibits, etc., was entrusted to a "Director of Exploitation." Offices were opened in New York and Chicago. With these offices as headquarters, a press bureau was established, through which the daily papers, and in particular the various

trade journals, were supplied with articles designed to stimulate the zeal of manufacturers and of the people in general. A circular of 110 pages, containing general information for intending exhibitors, and specifying the commercial advantages to be gained by participation, was published and distributed broadcast throughout the whole country. Special letters were written to individual firms, urging them, for patriotic and commercial reasons, to exhibit.

Much was also done by the Directors at the heads of the various groups, who travelled about energetically using their personal influence to induce producers to participate, and the Commissioner General himself, who visited nearly all the principal centres of industry where he addressed meetings and generally stimulated interest in the exhibition.

The work of obtaining and selecting suitable exhibits was fraught with many difficulties. The object held consistently in view was to make the United States sections as complete and representative as possible. But whereas in certain classes there was no lack of exhibitors, the excessive number of applicants in some cases making the work of selection extremely difficult, in other classes it was often impossible to procure exhibits. This was the case, of course, in classes where American manufacturers did not foresee, and could not from the nature of their products expect to reap, any commercial advantage, but where it was imperative for national reasons that the United States should be properly represented. The difficulty was finally overcome by deciding on governmental collective exhibits, the expenses in such cases being considerably lessened to the exhibitors, who could therefore be often induced to participate for patriotic motives. The selection of exhibits was in the hands of the directors and assistant directors of the various groups, who were aided by experts and advisory boards.

Transportation and Installation, etc.

Private exhibitors—*i.e.*, those who were not taking part in a governmental collective exhibit—had to make their own arrangements as regards transportation, unpacking and repacking, installation and insurance, and to bear all expenses in conection with the same, the Commission giving them no assistance beyond collecting and publishing reliable information as to ocean freights, railroad rates, etc.

For the transportation of the exhibits prepared by Government Departments, such as those of the Departments of Agriculture and the Navy, for the conveyance of much of the material used for construction and decoration, as well as for the transporation of the collective exhibits, a large unarmoured United States cruiser was employed, which made two trips to France conveying goods to the exhibition, and one from Havre to New York and Baltimore at the close of the exhibition.

The installation of the collective exhibits, and all the work connected with their setting up, decoration, upkeep, unpacking, etc., was undertaken by the Commission. The expenses were borne by the exhibitors, each contributing his share of the total amount expended, calculated on the amount of space taken up by his exhibit. The exhibitors also contributed to the blanket insurance policy which was taken out by the Commission on all material belonging to the Government and on the collective exhibits in charge of the Commission.

All articles contributed to the collective exhibits were, where feasible, displayed under the name of the manufacturer or producer.

The sale of goods during the exhibition was governed by the regulations made by the French authorities, and the Commission therefore made no arrangements with the owners of goods exhibited on that score.

The work of decorating the various sections, constructing façades, etc., was in the hands of the director of decorations. He was allotted $51,500, out of which sum specific amounts, ranging from $2,500 to $10,000, were to be devoted to certain groups. In each case, the director of each group was to determine the exact amount which should be spent out of the sum allotted.

Buildings.

The United States National Pavilion was erected at the cost of $116,239. The furnishing and decoration thereof was assigned to an art committee appointed by the Commissioner General. This committee collected subscriptions covering the cost of decoration and furnishing all but $1,895, which sum was defrayed by the Commission.

Three other buildings, the Agricultural, Merchant Marine, and Forestry annexes, as well as two kiosks, were built at the cost of the Commission, which also supervised the construction of six buildings at the cost of the exhibitors. The cost of the buildings erected by the Commission, excluding those for which the exhibitors paid and including the assessment paid by the Commission on the Automobile and Transportation buildings erected by the exhibition authorities, came to $173,510.

The report of the Commission does not state what sum, if any, was obtained by the sale of the United States Pavilion after the close of the exhibition.

Awards.

United States exhibitors gained the following awards, according to the various groups:—

	Grand Prizes.	Gold Medals.	Silver Medals.	Bronze Medals.	Honourable Mentions.
I. Education	41	65	41	16	6
II. Fine Arts	6	15	35	56	45
III. Literature, Science	18	43	63	45	14
IV. Machinery	10	24	45	49	29
V. Electricity	6	15	16	40	20
VI. Engineering and Transportation	17	34	44	15	11
VII. Agriculture	—	—	—	—	—
VIII. Horticulture	7	27	56	39	14
IX. Forestry and Fisheries	5	33	34	8	12
X. Foodstuffs	—	—	—	—	—
XI. Mining and Metallurgy	12	17	28	14	8
XII. Decoration and Furniture	4	26	35	32	17
XIII. Textiles	14	27	18	20	14
XIV. Chemical Industries	5	24	19	14	25
XV. Varied Industries	9	26	51	24	26
XVI. Social Economy	30	95	132	41	45
XVII. Colonization	—	—	—	—	—
XVIII. Naval and Military	—	—	—	—	—

The above figures are compiled from the official Report presented to Congress by the Commission. This Report had, according to the Act of Congress, to be presented within four months after the close of the exhibition; it is, in consequence, not a very finished document, though of great size. No attempt is made therein to compare the number of awards granted to the United States with those accorded to other countries. The French official report of the Exhibition contains, however, some interesting comparisons, though the figures do not quite tally with those of the United States official Report. According to the former, the number of United States exhibitors totalled 7,610 (in the American Report the grand total is put at 7,091), a number far in excess of the participants of other nations, being more than double the number of exhibitors from Great Britain, and about three times that of Germany. As regard awards, the United

States received 2,379, Italy 2,017, Germany 1,983, Great Britain 1,865, Russia 1,754, and Japan 1,307. Per thousand exhibitors, the United States received 313 awards, Germany 736, Italy 644, Great Britain 584, and Russia 552.

Finances.

The statement of expenditure contained in the Report presented to Congress was drawn up before the work of the Commission was entirely over, and only includes the expenditure up to February 15th, 1901. The chief items are:—

Clerks' salaries	$111,674
Buildings	250,000
Experts' salaries	245,435
Façades constructed	45,340
General employees' salaries	53,534
Insurance	10,788
Officers' salaries	44,862
Commissioners' salaries	50,581
Travelling expenses	106,803
Rent	43,229
Jurors	55,012

On the date of the Secretary's report there was a balance in hand of $71,348, including balances of the appropriations for commissioners and jurors which had not been fully expended. Before the work of the Commission was over special applications had to be made to Congress for permission to devote the above-named balances to the general expenses of winding up affairs, and the whole of the appropriation was thus spent.

LIÈGE, 1905.

For this exhibition the sum of $5,000 was appropriated, and three Commissioners appointed.

The Commissioners had great difficulty in inducing American firms to participate in this exhibition. One member of the Commission happened to be in St. Louis at the time of his appointment, and he endeavoured to persuade manufacturers taking part in the Louisiana Purchase Exposition to send exhibits to Liège, but he met with little success. Those firms who had been unsuccessful in securing orders after exhibiting at St. Louis were naturally unwilling to incur the expense of another such enterprise, while the successful exhibitors declared that their time would be completely taken up in meeting the new orders they had received and keeping up with their regular trade.

The expenses of the Commission exceeded the appropriation by $91.49, and the deficit was met by the Commissioners personally. The sanction of the Department of State was always obtained before the larger expenditures were incurred, and the actual disbursements were made by the Bureau of Accounts of the State Department.

By purchasing space from the exhibition authorities at wholesale rates, and selling to the individual exhibitors at retail rates, the Commissioners were able to increase their financial resources, and were able to produce much better results in the way of decorations, etc., than might have been expected from the smallness of the appropriation.

United States exhibitors received the following awards:—21 grand prizes, 18 diplomas of honour, 56 gold medals, 49 silver medals, 28 bronze medals, and 6 honourable mentions. The United States machinery exhibit was particularly good, American exhibitors receiving in one class, that of machinery tools, approximately half of the awards granted. Of the 28 nations represented in the exhibition, the United States were ninth in the number of exhibitors and seventh in the number of awards.

APPENDIX C.

Reports by H.M. Representatives Abroad.

VIII.—JAPAN.

(N.B.—Where Regulations and other details are enumerated, they refer, unless otherwise stated, to those adopted at the St. Louis International Exhibition of 1903, the latest for which full information is available.)

1. Japan has readily accepted invitations to participate in recent international exhibitions held in various countries. In doing so her Government have uniformly been actuated by the desire to benefit Japan's commerce and industries. The actions and instructions of the controlling bodies in each case show that immediate advantage in the shape of pecuniary profit from sales is not specially desired; that the principal object is to give foreign visitors at such exhibitions complete information as to Japan's most important products and her advance in various industries; and that control is exercised to exclude inferior and unimportant articles, and to show only representative exhibits, giving at the same time full information thereon to persons interested. The system of selection is devised to exclude all inferior exhibits, and both Government and private exhibits are combined to make a representative collection from the whole Empire.

2. The Japanese Government has taken part in the following Exhibitions (International) since 1887:—

(a.) Barcelona - -	1888	Government and individual
(b.) Paris - - -	1889	„
(c.) Hamburg - -	1889	Government
(d.) St. Petersburg Prison Exhibition -	1890	„
(e.) Chicago - - -	1895	Government and individual
(f.) Paris - - -	1900	„
(g.) St. Louis - -	1903	„

3. The amounts granted by the Japanese Government for the purpose of participation in international exhibitions is nearly all spent either in the preparation of official exhibits or in official and controlling expenses both in Japan and at the various exhibitions. The only sums which can properly be said to constitute subsidies to individual exhibits are the local transportation, packing, ornamentation, and other exhibition expenses, and the examination and administrative expenses incurred in Japan.

The following are the amounts expended by the Government at exhibitions since 1887:—

	Amount expended.
Barcelona - - - -	£3,550
Paris - - - - -	20,100
Hamburg - - - -	770
St. Petersburg - - -	830
Chicago - - - -	81,470
Paris - - - - -	134,705
St. Louis - - - -	80,466

In the case of the St. Louis Exhibition the total amount estimated and voted had been £81,667. Of the total sum expended only a very small amount could be regarded as devoted purely to the expenses of the "official exhibit"; thus only £3,178 was set aside for the preparation of the articles constituting this exhibit. There were, however, numerous heads of expenditure which covered both official and individual exhibits, of which the principal were:—

Construction of grounds and general building expenses - - - -	£6,864
Subsidy for tea house and selling pavilion - - - - - -	3,062
Furniture and ornamentation - -	11,968
Transport and correspondence (including £2,650 official exhibits) - -	3,820

In the Paris Exhibition of 1900 the cost of the articles of the official exhibit was set down as £6,521.

4. Except in the case of St. Petersburg Exhibition (when the Japanese section was under the control of the Legation officials) the exhibits from Japan have been managed by an Official Committee. These committees varied in number with each exhibition, and had even different numbers during the course of the same exhibition according as the number of officials, scientific experts, and secretaries was increased or decreased. The following list shows the approximate number of each committee at the various exhibitions:—

Breslau - - - - -	5
Hamburg - - - - -	3
Chicago - - - - -	110
St. Louis - - - - -	52
Paris - - - - - -	27
St. Petersburg (Legation).	
Paris - - - - - -	30

In the case of the St. Louis Exhibition the minimum number of the committee was 29 and the maximum 52; at the period of maximum it was composed of "Director," "Vice-Director," "Chief of Executive," eight "Executive Officials," 28 Secretaries, and 13 other employees.

5. The Exhibition Committee for the control of the Japanese section at the St. Louis Exhibition was constituted by Imperial Ordinance as a "Temporary Exhibition Committee," and exercised continuous control over matters pertaining to the Japanese section and to its preparation. The committee was composed as follows:—

Director.
Vice-Director.
Chief of Executive.
Executive Officials.
Examining and Consulting Officials.
Secretaries.

The Director, Vice-Director, Chief Executive Officer, Executive Officials, Examining and Consulting Officials were nominated by the Minister of Agriculture and Commerce and approved by the Cabinet; the Secretaries were appointed by the Director.

The whole committee was under the general control of the Minister of Agriculture and Commerce, who became its Director. The Executive Officials were mainly drawn from Government Departments, while the Examining and Consulting Officials included scientists and experts. (N.B.—The latter were attached to the committee, and were not an integral part thereof. Their work was liable to come to an end at various stages of the preparations, and they are not included in the numbers of the committee given above. The total number of Examining Officials was 52, of Consulting Officials 40.)

Sub-committees were formed from amongst the scientific and expert advisers to deal with the examination of exhibits and the various technical points raised.

The principal duties of the committee included—

1. The enaction of rules.
2. The issuing of notifications and instructions.
3. Correspondence with the Government authorities of the exhibiting country, with the exhibition authorities and other officials, and with local Japanese authorities in the various Prefectures.
4. The allocation of space.
5. The regulation of matters relating to exhibition stalls and decoration.
6. The construction of buildings and general arrangement of the Japanese section.
7. The opening and closing of the various sections of the Japanese exhibit.
8. Printing and publishing catalogues, illustrations, etc.
9. The compilation of a report.
10. The disposal of Government exhibits.

6. In providing funds for Japan's representation at the St. Louis Exhibition it does not appear to have been the intention of the Government to assist any particular industry or group of industries by grants in the nature of subsidies. The greater part of the money voted went in exhibition and various official expenses. The following list of items shows how the total amount was apportioned:—

Subsidy for exhibition group	£12,556
Committee expenses	11,109
Expenses of building and laying out grounds	6,864
Tea house and selling pavilion	3,062
Furniture and decoration	12,442
Transport and correspondence	3,820
Official exhibits	3,178
Entertaining	3,813
Salaries and wages	4,699
Travelling expenses	11,175
Miscellaneous (printing, stationery, repairs, etc.)	7,748
	£80,466

In many of the above items it was not possible to allocate a fixed sum for the service contemplated. Thus in the case of freight on official exhibits everything incurred had to be paid; again, in the matter of laying out grounds, building expenses, furniture and decoration, the amounts paid were the actual expenses incurred. It would appear that at the outset estimates had been made of the amount likely to be wanted, depending on the area allotted to Japan, the number of exhibits it would accommodate and the style of building and decoration considered suitable, and an amount was voted sufficient to cover everything.

With reference to the official exhibit it may be mentioned that the sum of £3,178 mentioned above as being set aside under this head did not represent the full value of that exhibit. In addition there were small sums contributed by various Government Bureaux, while a considerable number of exhibits were already in the hands of Government authorities, so that their acquisition involved no outlay; the total value of the Government exhibit was put down at about £6,250.

In dividing up the money at the disposal of the committee for the purchase or procural otherwise of the articles for the Government exhibits, estimates were obtained from the following Departments of the sums they considered necessary for their respective sections:

Department of Agriculture and Commerce (including the Agricultural Bureau, the Mining Bureau, the Forestry Bureau, the Patent Office, the Bureau for Marine Products, and the Geological Investigation Office).

Department of Education.

Department of Communications.

Department of the Interior.

Most of the estimates were reduced by the committee, which in deciding the amounts appear to have been influenced partly by the relative importance of the various sections to Japan, partly by the principle of selecting exhibits with a view to showing Japan's progress in different directions, and partly by the desire to choose new and hitherto unknown exhibits rather than articles with which people were already acquainted. The following list of the value of the exhibits from the various Government Departments will give an idea of the relative importance attached to the different sections:—

Department of Agriculture and Commerce		£3,923
Agricultural	£435	
Forestry	408	
Mining	285	
Geological Investigation	2,031	
Ironworks	42	
Patent Office	107	
Marine Products	513	
Hokkaido (Yezo)	102	
Department of Communications		424
Department of Finance (Tobacco Monopoly, note-making and printing)		17
Department of the Interior (hospitals, etc.)		414
Department of Education		1,470

In the case of individual exhibitors these benefited, of course, by the amounts expended in the preparation of the exhibition buildings, stalls, decorations, etc., but the only amount which was specially devoted to them was that coming under the heading "Subsidy for Exhibition Group." Even here, however, there were no direct subsidies paid to individual exhibitors, but only certain of their expenses paid.

It may be mentioned that exhibitors were not necessarily joined to any particular group. Firms, etc., large and important enough to dispense with assistance or external management of any kind, could either singly or in combination with other firms undertake all matters in connection with their exhibits themselves. Other exhibitors would be members of one or other of the twelve exhibition groups formed throughout the country. These groups in turn were for purposes of management, etc., formed into an association of groups, and it was this latter association which handled the subsidy of £12,556 mentioned above.

In addition to the above sum the association received a further £6,737, derived from entrance fees, commission on goods sold during the exhibition, etc. The total association funds were therefore £19,295, and the following are some of the principal items of expenditure thereof:—

Salaries, wages and bonuses	£4,474
Travelling	2,261
Hotel expenses, etc.	4,967
Rent	470
Examination expenses	204
Postage and telegrams	194
Notifications, advertisements, printing	480
Shipping and transport charges	510
Warehouse charges	408
Return freight charges	490
Packing charges of goods sold	122

The above figures appear to have been the original estimates, and together with various miscellaneous items total only £16,946, against the total of £19,295 ultimately disbursed. The balance of £2,547 was distributed in supplementary amounts (details not obtainable) under the different headings given above.

It should be mentioned that many of the local prefectures gave assistance towards the preparation of exhibits out of local funds. The total amount so given was £13,739. It is difficult to give the exact distribution of this sum, owing to the fact that the reurns are not uniform, some amounts including several items, while subsidies to the local "Exhibition Group" in some cases doubtless contained sums for freight, etc., elsewhere separately enumerated. The following figures, however, show approximately how the whole amount was appropriated:—

Subsidy to "Groups," and for other purposes	£7,100
Transport charges	2,145
Insurance	1,200
Packing charges	1,391
Travelling expenses	810
Miscellaneous	1,093

In some of the prefectures small sums were advanced to help local industries, such as agricultural and marine products, "soy," "Kaiki," etc.

The twelve groups themselves had funds at their disposal. These were the subsidies received from the local authorities, and also a small amount from the Association of Groups, together with sums received from town and district authorities, fees, etc., making a total of £12,384. The accounts of the groups not being uniform, the following distribution is approximate only:—

Packing	£1,133
Freight	2,395
Insurance	1,324
Travelling	4,601
Other	2,931

7. The executive staff dealing with the organisation and preparation of exhibits was, as already indicated, a part of or attached to the Exhibition Committee. Sub-committees were formed as necessary to deal with the exhibits. It was in these matters that the examiners and councillors already mentioned were mainly engaged. Amongst the examiners were ten Fine Art School Professors, two Technical School Professors, two experts from the Department of Agriculture and Commerce, together with experts from the Education Department, Patent Bureau, Engineering College, etc. The councillors included ten directors of various bureaux of the Department of Agriculture and Commerce, officials from the Foreign Office, Departments of Education, Finance, and the Imperial Household, several Japanese Consuls in the United States, experts, etc. In addition to the members (full and attached) of the Committee, there were engaged at one time or another sixty-four other officials, as builders, landscape gardeners, auditors, transport, and packing officers, etc.

8. The cost of the pavilion, as a whole, is gathered from the figures already given above. Including the building expenses generally and the laying out of the grounds, the tea house and selling pavilion, together with furniture and decoration, the total cost amounted to £22,368. At the conclusion of the exhibition a great part of the buildings, etc., were disposed of otherwise than by sale, much being presented away in different quarters. The portions sold realised about £105 only.

9. In the matter of selecting the articles to constitute the official exhibit, the Exhibition Committee included among its members representatives from most of the Government Departments concerned, and it was possible, by consultation, to arrive at an agreement as to the exhibits to be chosen. There were items difficult of or unsuitable for collection by individual exhibitors, and noteworthy articles already in existence which found a ready place in the list of the official exhibit. Bearing in mind the principle of selecting only articles of the highest quality especially pointing to Japan's progress, resources, and future possibilities, the funds available were allotted to the Departments considered to require them the most, and the primary selection of the articles to be sent was left to the Department concerned. Section 5 has already given the names of the various Departments and bureaux represented. The official exhibits were collected through the Departments by some 51 Government bureaux (central and local), 22 universities and schools, and other bodies.

In the case of individual exhibitors, information was circulated by means of notifications and instructions in official publications, and by communication with local authorities and Chambers of Commerce.

Regulations were issued providing, in the case of private or individual exhibits,

1. That ordinary goods for exhibition must be either articles of commerce or capable of becoming such in future.

2. That Fine Art objects for exhibition must pass the test of expert examination.

3. That machinery for exhibition must be either of superior Japanese design or an improvement upon foreign manufacture.

4. That articles for exhibition illustrating science, economics, sanitation, transport, construction, music, and printing must be such as to show the history of Japan and her progress in civilisation.

5. That where certain classes of commodities were concerned, only articles of importance should be exhibited (*e.g.*, in the case of agricultural exhibits only rice, tea, lily bulbs, pot plants, camphor, and other leading products were allowed; while similarly in the case of marine products these were limited to nets, salted, tinned and dried fish, seaweeds, corals, etc.).

6. That silk, educational, and mining exhibits should be shown only in accordance with the regulations of the Committee.

7. That certain classes of goods should not be allowed to be exhibited. These included—

(a) Articles manufactured, collected, or produced prior to 1895.
(b) Goods previously exhibited at International Exhibitions.
(c) Patent medicines.
(d) Articles injurious to public morals or health. perishable goods, and those liable to putrify or cause damage or inconvenience.

8. That local authorities should have power to limit the exhibits from their districts when necessary.

9. That intending exhibitors should make application according to a certain form, addressed to the local authorities (in the case of Fine Art goods to the office of the Exhibition Committee), and that the application should be accompanied by explanatory details, including

(a) Name and residence of intending exhibitor.
(b) Name of the goods and the place of production or manufacture.
(c) Annual quantity of goods produced or manufactured.
(d) Quantity of the goods exported annually and the countries of destination.
(e) Details of the factory or place of production, number of workmen, etc.
(f) Methods of production or manufacture, quality, method of employment, etc.
(g) List of awards (if any) given for similar articles at any exhibition either at home or abroad.
(h) Any other particulars of importance.

The application form had to contain, in addition, details as to the size, shape, appearance, number, weight, and price of the article or articles proposed to be exhibited.

10. That in the case of exhibits involving special construction work the necessary plans and explanations therefor should accompany the application.

11. That no responsibility for loss or damage should attach to the Exhibition Committee or to other officials.

12. That the Exhibition Committee would pay for freight, insurance, exhibition, and decoration expenses of fine art exhibits, but that exhibitors desiring to incur on their own behalf special exhibition and decoration expenses could do so on application to the Exhibition Committee.

13. That exhibitors unable personally to superintend various details as to transportation, installation, maintenance, sale and return of goods exhibited might appoint an agent to undertake such work

14. That for reasons of economy and convenience exhibitors throughout the country might be united in a single group, and that the Exhibition Committee could grant a subsidy in aid of the management expenses of such group, but that on the requisition of the Committee all other exhibitors had to be admitted to the group.

15. That when exhibitors managed their own exhibits or appointed a manager other than that of the group this had to be reported to the Exhibition Committee.

16. That details as to exhibits or their management should be reported to the Exhibition Committee.

(N.B.—Fine art exhibits were in some matters treated a little differently to ordinary exhibits. In addition to points already noted they had to be sent direct for examination by the experts of the Exhibition Committee in Tokio instead of through the local authorities, where the exhibitor was not the actual maker the name of the latter had also to be given, and the price both of production and of selling had to be mentioned.)

In addition to the rules laid down for the regulation of individual exhibits, advice on various points was

tendered to exhibitors in the shape of notices. These included suggestions:

1. Not necessarily to seek immediate profit by way of sales but to compete for awards, and to select exhibits with a view to extending business and markets.

2. To select exhibits suitable to foreign taste, and to bear in mind such factors as atmospheric conditions, seasons, foreign customs and way of living, and the general conditions of the territory to which the exhibits were to be sent.

3. To select fine art exhibits with regard to originality of design, excellence of manufacture, and general artistic qualities, and also with a view to conveying ideas of Japanese taste, scenery, etc., and to arouse interest by careful arrangement and a large variety of exhibits.

4. To refrain from exhibiting goods produced merely in small quantities or which were interesting as curiosities only.

5. To avoid exhibiting, as far as possible, goods similar to those exhibited by many others, as this might lead to selection of those of the best quality only.

6. To send spare samples of goods for examination to avoid delay in case of loss or damage.

7. To prepare such exhibits as fireworks, matches, etc., in a manner different to and more precautionary than other exhibits.

8. To write name and price cards in English, and also to prepare explanatory descriptions in English, giving various information about the goods shown; further, whenever considered advisable, to prepare photographs illustrating goods and processes.

9. To fix the selling price of exhibits at the cost price plus import duty, freight, insurance, packing, etc.

10. As will have been seen from the rules above, the Exhibition Committee had extensive powers in the matter of selection of exhibits. It was not, however, any part of their scheme to organise a "collective exhibit" except in so far as the official exhibit could be so described. The initial application of intending exhibitors went to their respective local authorities, who had certain powers of rejecting goods obviously unfit, excessive in quantity, or which did not comply with regulations. So far as exhibits which came before the committee were concerned, it would seem that had there been sufficient space for all the only objection to every exhibitor being represented would have been failure to comply with the minimum standards and rules laid down. Where the number of intending exhibitors exceeded that capable of accommodation the committee had the power of selection according to quality; apart from this, however, it would appear that all exhibits were passed which satisfied the examiners and complied with the rules.

11. Although not a collective exhibit, considerable stress was at all times laid upon clear and proper marking of goods exhibited so as to give full information to visitors. The actual name of the exhibitor does not seem to have been necessary, though as other details of description, method of use, price, etc., were a matter of rule, it is probable that the exhibitor's name was expected also. The fact that in the application for fine art exhibits it was necessary to mention both the name of the exhibitor and of the maker would suggest that in the case of other exhibits the name of the producer, when not the exhibitor, might be omitted.

12. (a) Packing.

So far as the Exhibition Committee were concerned, packing was the work of the exhibitors themselves. The latter might, of course, superintend the task themselves or might get assistance, pecuniary or other, from the group or association of groups to which they belonged.

There were, however, various instructions issued for the guidance of those sending goods. Of these the principal were:—

1. Goods should as a rule be packed in an outer case, generally of wood, but sometimes of canvas.

2. In the case of boxes the thickness of wood should not exceed 1 inch; where canvas covers were used the thickness should be four-fifths of an inch maximum.

3. Boxes should be of cedar or fir, well dried, and left unplaned; two cross pieces on each end should be used, and metal bands around the boxes should join half way along the upper side. Old boxes should not be used.

4. Although good substantial boxes were necessary to prevent breakages and leakage, excessively heavy cases were to be avoided so as to prevent undue freights, etc. The ordinary suitable size of a packed box was set down at one-fifth of a ton; beer and "shoyu," however, should be packed in cases of one or two dozen.

5. For inner packing offensive cotton waste, oil paper, old newspapers, and wet straw were not to be used; good straw was permissible, but cotton and soft paper were recommended.

6. Art metal goods and cloisonné were allowed inner cases, but these had to be marked similarly to the outer cases.

7. Glass bottles, with or without liquids, had to be separately packed in straw.

8. Embroideries and paintings had to be packed in watertight tin cases soldered down and packed in outer cases.

9. Two boards, with the shipper's name, nature of the contents, and destination (the exhibition) were to be fastened to the ends of the case, inside the box a statement of the contents and their value was to be placed.

10. A list of the contents of each box was to be made in quintuplicate, one copy being fastened on the box and the other four being sent to the Transportation Company.

(b) Transport and insurance.

In principle these charges also came on exhibitors themselves. As to transport, the Exhibition Committee undertook those at the place of exhibition—*i.e.*, those which it was not possible to settle before the goods left Japan. As has been seen in the local and other accounts given, exhibitors benefited to a small extent by the subsidies given to exhibition groups and by the sums contributed by the local authorities.

The Government, however, made arrangements to secure reduced freight rates to St. Louis by the following lines running to United States ports—the Nippon Yusen Kaisha, the Toyo Kisen Kaisha, the Pacific Mail Steamship Company, and the Oriental and Occidental Steamship Company. These reduced rates were at first 20 per cent., but a further reduction was afterwards obtained, so that the final freights were:—

Per 40 cubic feet, £1 6s. 8d., reduced from £2 1s. 8d., or 36 per cent.

Per 1 English lb., 1s. 2d., reduced from 3s. 4d., or 33·3 per cent.

These reductions were applicable to exhibits, timber for exhibition buildings, boxes, show cases, ornamentation work, etc., and were continued in the case of return freights.

It may be here mentioned that the Government also made arrangements for reduced fares to be granted by the same companies, and, in addition, the Canadian Pacific Railway Company and the Boston Steamship Company.

The reductions were as follows:—

By the Nippon Yusen Kaisha and the Boston Steamship Company—

1st class—£32; reduced from £40.

3rd class—£21; reduced from £26 (granted only by special arrangement). These rates were granted to members of the Exhibition Committee, exhibitors, and exhibitors' representatives.

By the Toyo Kisen Kaisha, the Pacific Mail Steamship Company, and the Oriental and Occidental Steamship Company—

1st class return (available nearly 12 months)—£62 16s., reduced from £94 (12 months return) and £84 (four months return).

3rd class return—£26. These rates were granted to members of the Exhibition Committee, exhibitors, and visitors to the exhibition.

By the Canadian Pacific Railway Company—

1st class return—£62, reduced from £84 return. This rate was granted to members of the Exhibition Committee and exhibitors.

Applicants for the above reduced rate tickets had to produce certificates showing the capacity in which they were proceeding to St. Louis.

(c) Installation and maintenance in repair.

In the case of official exhibits these were attended to by the Exhibition Committee. Where independent individual exhibitors were concerned they themselves were responsible for the various steps necessary. They or their representatives had to attend to such matters, complying with any restrictions or obligations placed on them by the committee or the exhibition authorities. In the case of exhibitors belonging to exhibition groups the association or its representatives undertook such work. They superintended the transport of the exhibits, unpacking, installation, general management, explanatory catalogues, sales, return of goods, etc. There was nothing, however, in cases where special or expert knowledge was necessary to prevent the exhibitor or a representative from making arrangements to co-operate and assist the agents of the association in any matter.

(d) The representation of individual firms whose goods were included in the official exhibit.

The official exhibit was entirely controlled by the Exhibition Committee, and there was no representation of the original owners of the goods. In the case of other exhibits regulations similar to those operative in the matter of installation applied.

(e) Sale of goods.

In the ordinary sections of the exhibition, the goods at the different Japanese stalls were allowed to be sold only on condition that they were not delivered until the close of the exhibition; after the first five months, however, such goods were allowed to be sold during the remaining four months for immediate delivery, but the quantity of things disposed of in the latter manner was comparatively small.

In addition to the above sales there was in the Japanese park a sales building, or bazaar. In this building only exhibitors or their agents had the right of selling goods, and this right could not be transferred to others. It was, however, possible for selling exhibitors to make combinations for convenience of management, though this could only be done on obtaining the permission of the Exhibition Committee and their sanction to the rules of the combination.

A commission was charged by the committee on goods sold at the exhibition, the amount of which went to the funds of the association of groups.

Goods for sale had to bear a ticket clearly stating the price; where it was impossible to attach such a ticket to the exhibits it had to be placed in front of the stall in a conspicuous position. Prices of goods for sale and also changes in the price had to be reported to the Exhibition Committee, and weekly reports of sales and prices obtained had also to be submitted.

All the expenses of selling had to be settled by the sellers. The arrangement and fitting of the stalls for the sale of goods had to be approved by the Exhibition Committee; the latter had, indeed, general control over all matters relating to selling, and in the event of disobedience to rules or orders had power to order the stall concerned to be closed, and that without any responsibility for loss or damage.

Even after the exhibition exhibits were not to be sold at a discount except with the sanction of the committee.

(f) Repacking and returning goods after the close of the exhibition.

Arrangements for repacking and returning were similar to those for packing and sending. In the case of official exhibits and independent individual exhibitors the Exhibition Committee and the exhibitors were respectively responsible for the matter. In the case of other exhibits the association of groups managed affairs, though the return freight, like that going, was at the expense of the exhibitor.

The same boxes, etc., were used, and arrangements had been made for the non-payment of import duty on these, so that these were considered to have been bonded during the exhibition.

In the case of articles, whether official or individual exhibits, returning to Japan, no import duty was payable in the United States. Goods shipped through to the exhibition were regarded as bonded while there until the end of the exhibition. In the case of goods being sold duty was payable by the sellers, whose price made allowance for this item; duty was also payable on official exhibits, which, by being exchanged or presented, did not return to Japan.

13. Details have already been given as to the distribution of the cost of the various operations. In the case of official exhibits everything was paid by the Committee out of Government funds; independent individual exhibitors also pair their own expenses, except in so far as they benefited by the General Committee expenditure at the Exhibition. Individual exhibitors belonging to the various groups benefited in several ways from the funds at the disposal of the association of groups, of the groups themselves, and of the local authorities. The total funds thus available was as follows:—

	£
Exhibition Committee	80,466
Association of Groups, £19,293, less £12,556 from the Exhibition Committee	6,737
Local Prefectures' contributions	15,759
Local groups, £12,384, less £6,706 received from Prefectures and £189 received from Association of Groups	5,489
	£106,431

For reasons already mentioned, it is difficult to give exact figures for the various items, but the following sums are estimates:—

	£
Packing	3,500
Freight	7,000
Insurance	3,500

14. In allocating space, the Exhibition Committee were, to a considerable extent, guided by the accommodation obtained at the Exhibition. These different buildings contained the various groups of exhibits, and it had been a matter of prior arrangement what amount of space in each building was at the disposal of Japan. The Committee were able to form an idea of the space required from their knowledge of the importance of the different industries to Japan, and from the number of exhibits they considered likely to come forward for examination. The following table gives the area of the sections at first judged necessary and that ultimately secured:—

Class of Exhibits.	Original area desired.	Area obtained ultimately	Net area for Exhibits.
	sq. ft.	sq. ft.	sq. ft.
Education and Economic	3,000	5,468	3,948
Fine Art	10,000	7,398	7,398
Industrial	80,000	75,775	55,937
Electrical		1,596	1,176
Transport	3,000	16,046	11,107
Mining	5,000	8,078	5,588
Forest, Fish, etc.	4,000	6,948	4,559
Agriculture	6,000	10,872	7,527
	111,000	152,179	95, 240

These spaces were anticipated approximately to suffice for probable exhibits. Where exhibits were in excess of the space provided, the Committee were guided in their selection by the rules and suggestions already quoted. Exhibits which violated any of the rules in section 8 were rejected; in the case of others those which adhered most to the Articles 1 to 5 of the Suggestions to Exhibitors quoted in the same section received preference in the matter of selection. It does not appear that there was much difficulty in making selections; the system of Groups and the Association of Groups imposed restraint on the outset in the matter of excessive number of exhibits, while the power of the local authorities to limit the exhibits from their districts helped to lessen the task of the Committee in making selections.

In the case of the Selling House, however, the question of selection involved difficulties of another kind.

Exhibitors whose goods had been passed for the main exhibit had the right to be represented in the Selling House, and it was not possible to apply the same principles of selection as in the case of original applicants for permission to exhibit. The area of the Selling House was 8,028 square feet, while the total applications from 57 exhibitors involved a space of 12,960 square feet. In order to settle the difficulty thus caused, it was decided to hold a consultation between the Exhibition Committee and the exhibitors; the result was that an arrangement was made by which the Selling House was divided into 27 stalls of varying sizes on which 48 exhibitors were given representation.

15. The following is a list of the number of exhibitors in each section and of the exhibits shown by them:

Section.	Number of Exhibitors.	Number of Exhibits.
Education	56	1,437
Fine Art	158	268
Industrial	1,658	90,955
Engineering	7	151
Electrical	8	75
Transportation	10	555
Agricultural	383	11,744
Horticultural	27	4,531
Forestry	58	6,814
Mining	45	2,550
Fishery	69	7,684
Anthropological	1	46
Economic	6	917
Physical Education	3	62
Total	2,449	127,525

The following is the list of awards gained by Japan in the various sections:—

Section.	Highest Award.	Gold Medal.	Silver Medal.	Copper Medal.
Education	12	10	4	2
Fine Art	6	29	41	22
Industrial	87	226	477	502
Engineering	–	1	1	1
Electrical	–	4	1	1
Transportation	2	–	1	1
Agricultural	24	48	29	20
Horticultural	1	5	8	5
Forestry	5	14	16	16
Mining	9	6	9	5
Fishery	6	15	18	11
Anthropological	–	1	–	–
Economic	4	1	–	–
Physical Education	–	1	2	–
Total (1,706)	156	559	607	584

There were besides some awards to co-operators in the Exhibition, consisting of highest awards 5, gold medals 61, silver medals, 57, and copper medals 50—a total of 155.

The following is the list of awards by countries:—

	Highest Award.	Gold Medal.	Silver Medal.	Copper Medal.	Total.
United States	1,000	2,500	2,750	5,000	9,250
France	698	800	493	264	3,225 (?)
Germany	440	620	450	240	1,750
Japan	156	556	601	589	1,702
Brazil	62	579	576	505	1,522
Argentine	29	249	335	297	910
Great Britain	154	244	168	155	679
Italy	78	247	198	155	676
Ceylon (?)	19	59	119	72	269
Siam	6	51	40	45	183 (?)
China	36	66	57	52	151 (?)
Peru	1	23	19	19	62
Sweden	15	24	16	1	58 (?)

(N.B.—The figures for Japan in the above table do not quite agree with the figures previously given, but they are both taken from official returns, and the difference is presumably due to some special re-arrangement of the comparative table of awards.)

16. So far, Japan can hardly be considered to have had as full an experience of exhibitions as several of the other leading nations. Although she has taken part in exhibitions for a good many years past, and has had several national and special exhibitions of her own, still, owing to the hitherto backward state of her industries and commerce, the number of people who might be directly affected thereby must be considerably smaller than that of several other countries. Moreover, though as detailed above, the question of participation in exhibitions was largely left to individual initiative; still, the great interest taken by the Japanese Government in commercial and industrial development makes it probable that there was more control exercised over the selection and arrangement of the exhibits than might appear. The great ramifications of the Japanese official system, the existence of the semi-official Guilds, and the close relations which are usually regarded as existing between the Government and some of the leading Japanese firms, would all point to the probability of such control. Making allowance for the above, however, there can be little doubt that Japanese manufacturers and merchants, as a whole, look with a favourable eye on such exhibitions.

In the records of exhibitions held in Japan a steady increase in the number of visitors can be noted, and this is a standing argument in favour of the view that by such means the wares of the exhibitors are brought prominently to the notice of a large section of the population. Although still backward in many branches of trade and manufacture, the Japanese are keenly awake to ways and means of commercial expansion, and they especially show their appreciation of the benefits accruing from advertisement, and an exhibition is looked upon as an excellent means of advertising, especially in the matter of new industries which it is desired to make a matter of common knowledge.

17. Reasons in favour of exhibitions have been given in the preceding paragraph. Apart from these, a point in connection with international exhibitions which may have weight with official departments is the desirability of keeping the world at large informed of Japan's general industrial and commercial progress. Credited as she is with qualities of various kinds, Japan is still regarded as backward in trade matters. She is nevertheless making considerable advances, and there is a feeling that her progress in such matters should be known by other nations, and that she should receive credit therefor. The

various instructions and advices all contain reference to the selection of objects for exhibition 'of recent date and design," "of the best manufacture," "illustrating Japan's progress," showing the feeling that a good display may redound to the benefit of Japan's industries and commerce.

It is difficult to find important arguments against exhibitions whose utility as a whole is admitted. Some criticisms in the case of special commodities based on expense and distance, and doubts whether the benefits equal the outlay seem to be the principal, but for the most part, opinions are in favour of exhibitions.

18. There has never been an international exhibition in Japan, and the views of British merchants on the subject of the possible advantage accruing therefrom to British trade are somewhat doubtful. There have been several domestic exhibitions at which there has been a foreign section, and local British firms have been represented there. There appears to be some conflict of opinion as to the utility of such representation. Firms doing a good business in patent articles or in some specialities which are widely known might feel constrained to exhibit to keep pace with competitors and yet consider that their business was not materially benefited thereby. Others, again, regard the opportunities of examination and inspection thus given to trade rivals with apprehension. Some deal in articles too expensive or too special to interest any people except Government authorities and other large concerns which are more easily approached by more direct means. On the whole, however, opinion is favourable to exhibitions. The Japanese have the faculty of interest, and even curiosity, largely developed; they travel a great deal in their own country, and the result is that an exhibition appeals intelligently to a very large section of the people who thus have the various commodities on show brought strongly to their notice. They are, moreover, a people to whom actual demonstration of the working or utility of an article specially appeals; a machine in operation showing thus its value, a model strikingly indicating its own uses, or specimens whose purpose or application is evident, excite the ready attention of a people who for many years have been accustomed to look for changes and progress everywhere. It is also true that between Japanese and foreigners the language obstacle is still a matter of great difficulty, and however good the organisation of a firm may be in meeting this trouble, anything which can be of utility in overthrowing, even temporarily, this barrier, is very welcome. For these reasons it may be considered that on the whole exhibitions, but more especially international, are regarded as useful in furthering British trade.

19. An international exhibition, the first of its kind in Japan, is proposed to be held in Tokio in the year 1912.

APPENDIX D.

RETURN Shewing Actual Expenditure from Public Funds in Respect of the Participation of this Country in International Exhibitions.

Year.	Place.	Expenditure.	Body Responsible for Expenditure.
		£	
1853	New York	2,432	Royal Commission.
1855	Paris	41,253	Science and Art Department.
1867	Paris	120,556	Royal Commission.
1873	Vienna	30,352	Royal Commission.
1875	Paris (Maritime)	1,973	Mixed Committee.
1876	Philadelphia	40,462	Science and Art Department.
1878	Paris	73,712	Royal Commission.
1879	Sydney	9,203	Royal Commission.
1880	Melbourne		
1885	Antwerp	198	Foreign Office Agent.
1885	New Orleans	200	Foreign Office Agent.
1888	Barcelona	85	Foreign Office Agent.
1887	Adelaide	3,864	Royal Commission.
1888	Melbourne	6,557	Royal Commission.
1891	Jamaica	1,000	Colonial Office Committee.
1893	Chicago	61,464	Royal Commission (Society of Arts).
1894-5	Tasmania	2,000	Royal Commission.
1894	Antwerp	388	Foreign Office Agent, with Committee of London Chamber of Commerce.
1897	Brussels	4,753	Committee of London Chamber of Commerce.
1900	Paris	97,033	Royal Commission.
1904	St. Louis	128,000*	Royal Commission.
1906	Milan	5,300*	Committee of London Chamber of Commerce.
1906-7	New Zealand	8,000*	Committee of Colonial Office and Board of Trade.

INTERNATIONAL EXHIBITIONS COMMITTEE.

LIST OF WITNESSES.

In the order in which they appeared before the Committee.

Date.	Name of Witness.	Profession, Occupation or Residence.	Number of first Question.	Page.
1906. 1st Day - Nov. 9th.	Colonel Sir H. JEKYLL, R.E., K.C.M.G.	Assistant Secretary, Railway Department of the Board of Trade; Secretary of the Royal Commissions for the Melbourne Centennial Exhibition, 1888, and of the Royal Commission for the Paris Exhibition, 1900.	1	1
2nd Day - Nov. 16th.	Colonel Sir C. M. WATSON, R.E., K.C.M.G., C.B.	Secretary of the Royal Commission and Commissioner General St. Louis Exhibition, 1904.	148	6
	*Sir ISIDORE SPIELMANN - -	Honorary Secretary, British Fine Art Section, Brussels Exhibition, 1897; Director, British Fine Art Section, Paris Exhibition, 1900; Honorary Assistant Secretary, Royal Commission for St. Louis Exhibition, 1904; Art Director to the British Government Exhibit, New Zealand International Exhibition of 1906–7.	391	14
3rd Day - Nov. 30th.	Sir HENRY TRUEMAN WOOD -	Secretary of the Society of Arts - - -	548	20
	Sir Isidore Spielmann (recalled) -	- - - - - - - - -	805	30
	Sir BOVERTON REDWOOD - -	Representing the Society of Chemical Industries, President of the International Jury for Lighting Appliances and Materials, Brussels Exhibition, 1897, British Juror at the Paris Exhibition, 1900, Member of the British Commissions St. Louis Exhibition, 1904, and Milan Exhibition, 1906.	815	31
4th Day - Dec. 7th.	Mr. A. MASKELL, F.S.A. - -	Representative of the South Kensington Museum Art Library, Munich International Exhibition, 1876, and Superintendent of the Music Division of the International Inventions and Music Exhibition, 1885.	877	37
	Mr. ARTHUR SERENA - -	Honorary Executive Commissioner for the Milan Exhibition, 1906.	963	41
	Mr. IMRE KIRALFY - - -	Commissioner-General of the British Section at the Liège Exhibition, and Secretary to the Franco-British Exhibition, 1908.	1115	49
1907. 5th Day - Jan. 11th.	Sir W. H. PREECE, K.C.B., F.R.S.	Late Engineer-in-Chief to the General Post Office and Past President of the Institution of Civil Engineers and of the Institution of Electrical Engineers; Juror and Member of Executive Council, Paris Exhibition, 1889; Member of Royal Commissions, Chicago, 1893; and Paris, 1900.	1305	57
	Mr. BENNETT H. BROUGH -	Secretary of the Iron and Steel Institute; British Juror, Paris Exhibition, 1900.	1436	63

* For further evidence by Sir Isidore Spielmann, see third and twenty-third days (pages 30-31 and 285-291), also Appendices I, II. and III. (pages 312 to 316).

Date.	Name of Witness.	Profession, Occupation or Residence.	Number of First Question.	Page.
1907. 6th Day - Jan. 25th.	Mr. THOMAS COPE - - -	Member of the firm of Messrs. Henry Johnson & Sons, Exhibition and Transport Agents, London, and Member of the British Commission, Milan Exhibition, 1906.	1543	69
	Mr. WILLIAM BURTON - -	Member of the firm of Pilkington's Tile and Pottery Company, Ltd., near Manchester.	1710	76
7th Day - Feb. 1st.	Mr. W. F. REID - - -	Technical and Consulting Chemist (representing the Society of Chemical Industries); British Juror St. Louis Exhibition, 1904, and Milan Exhibition, 1906.	1872	86
	The Right Hon. Lord ALVERSTONE, G.C.M.G.	Lord Chief Justice of England, Member of the Royal Commissions for the Exhibitions at Chicago, 1893; Paris, 1900; and St. Louis, 1904.	2066	94
8th Day - Feb. 7th.	Mr. ARTHUR W. DOWN - -	Member of the firm of Messrs. Down Bros., Surgical Instrument Makers etc., London.	2181	102
	Mr. LUCIEN SERAILLER - -	Member of the Executive Staff of the British Commissions for the Exhibitions at Paris, 1900, and St. Louis, 1904.	2303	106
	The Right Hon. Lord Justice FLETCHER MOULTON, F.R.S.	Member of the Royal Commission for the Chicago Exhibition, 1903, and British Juror at the Paris Exhibition, 1900.	2432	111
9th Day - Feb. 14th.	Mr. WALTER MAPPIN - -	Director, Messrs. Mappin and Webb, Jewellers and Silversmiths, London.	2488	115
	Mr. R. J. GIBSON - - -	Director, Messrs. Mappin and Webb, Jewellers and Silversmiths, London.	2489	115
	Mr. IRA H. HILLMAN - -	Member of the firm of Messrs. Hillman, Bros., Exhibition Agents, Newbury.	2680	121
	Mr. J. H. CUNDALL - - -	Member of the Executive Staff of the British Section, Paris Exhibitions, 1878, 1889, 1900; Vienna Exhibition, 1873; Philadelphia, 1876; St. Louis, 1904; and Milan, 1906.	2877	128
10th Day - Feb. 21st.	Mr. SIDNEY SPARKES - -	Director, Messrs. Clayton and Shuttleworth, Ltd., Agricultural Engineers, Lincoln.	3032	133
11th Day - Feb. 28th.	Mr. EDMUND H. LLOYD - -	Member of the Executive Staff of the British Sections, Paris Exhibition, 1900; St. Louis Exhibition, 1904; Assistant Manager, Dublin Exhibition, 1907.	3183	139
	Mr. AUGUST BORNEMANN - -	Managing Director, Messrs. Ruston, Proctor & Co., Ltd., Engineers, Lincoln.	3419	145
	Mr. F. HOOPER - - -	Secretary of the Bradford Chamber of Commerce.	3603	151
12th Day - March 7th.	Mr. A. HEAL - - - -	Member of the firm of Messrs. Heal & Son, Furniture Manufacturers and Upholsterers, London.	3740	156
	Mr. WALTER BIRCH - -	Member of the firm of Messrs. Birch and Co., Ltd., Furniture Manufacturers and Upholsterers, London.	3898	161
13th Day - March 14th.	Mr. F. T. FORD - - -	Managing Director of Messrs. T. B. Ford, Ltd., Blotting Paper Manufacturers, Loudwater.	4089	167
	Mr. PHILIP BAKER - - -	Member of the firm of Messrs. Joseph Baker & Sons, Ltd., Manufacturers of Baking and other Machinery, London.	4253	174

Date.	Name of Witness.	Profession, Occupation, or Residence.	Number of First Question.	Page.
1907. 14th Day - March 21st.	Mr. G. Collins Levey, C.M.G. -	Representative of the Colony of Victoria Vienna Exhibition, 1873; Philadelphia Exhibition, 1876; Paris Exhibition, 1878; Organiser, Melbourne Exhibition, 1880–81; Organiser of the British Section, Adelaide Exhibition, 1887; Secretary of the Colonial Committee of the Royal Commission, Paris Exhibition, 1900.	4368	178
	Mr. W. H. Feltham	Member of the firm of Messrs. W. H. Feltham & Co., Manufacturers of Cotton Bags, London and Manchester.	4481	185
15th Day - April 11th.	Mr. David Howard - - -	Chairman of the firm of Messrs. Howards & Sons, Ltd., Manufacturing Chemists, Stratford, E.	4611	189
	Mr. F. A. Darton - - -	Member of the firm of Messrs. F. Darton & Co., Scientific Instrument Makers, London.	4741	193
16th Day - April 18th.	Sir Albert K. Rollit - -	Chairman of the International Exhibitions Committee of the London Chamber of Commerce.	4901	198
	Mr. Arthur Greenwood -	Chairman and Managing Director, Messrs. Greenwood & Batley, General Electrical and Mechanical Engineers, Leeds.	5121	209
17th Day - April 25th.	Mr. E. Powell - - -	Chairman and Managing Director, Messrs. Humber, Ltd. (representing the Society of Motor Manufacturers and Traders).	5278	213
	Mr. S. F. Edge - - -	Director, Messrs. S. F. Edge, Ltd. (representing the Society of Motor Manufacturers and Traders).	5279	213
	Mr. T. F. Woodfine - -	Secretary to the Society of Motor Manufacturers and Traders.	5280	213
	Mr. George Jennings - -	Director, Messrs. George Jennings, Ltd., Sanitary Engineers, London.	5474	221
18th Day - May 2nd.	The Right Hon. Lord Brassey, G.C.B.	Representative of the London Chamber of Commerce.	5577	223
	Mr. Charles Charleton -	Representative of the London Chamber of Commerce.	5578	223
	Mr. John T. Willams - -	Manager, Messrs. Hitchcock, Williams & Co., Drapery Warehousemen and Manufacturers, London.	5694	231
	Mr. Mark W. Zambra - -	Manager, Messrs. Negretti and Zambra, Scientific Instrument Makers, London -	5783	234

MINUTES OF EVIDENCE

TAKEN BEFORE THE

INTERNATIONAL EXHIBITIONS COMMITTEE.

FIRST DAY.

Friday, 9th November 1906.

PRESENT:

Sir Alfred E. Bateman, K.C.M.G. (*Chairman*).
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G.
Sir James Kitson, Bart., M.P.
Mr. Algernon Law.
Mr. Malcolm Ramsay, C.B.
Sir Isidore Spielmann.
Mr. S. J. Waring.

Mr. U. F. Wintour, *Secretary.*

Colonel Sir Herbert Jekyll, R.E., K.C.M.G., called; and Examined.

Colonel Sir H. Jekyll, R.E., K.C.M.G.

9 Nov. 1906.

1. (*Chairman.*) I think you are Assistant Secretary of the Railway Department of the Board of Trade?—I am.

2. I need not ask you about all the appointments you held in various parts of the world before accepting that office, but I believe you were Secretary of the Royal Commission for the Melbourne Centennial Exhibition in 1888?—I was.

3. And you were also Secretary of the Royal Commission for the Paris Exhibition in 1900?—Yes.

4. What is your opinion of the old system under which the exhibitors paid their own expenses?—I do not think it can be continued with advantage any longer. In the first place, the bulk of the manufacturers are tired of exhibitions; they have had enough of them, and it requires a very strong inducement to get them to exhibit at all. Certainly, the best manufacturers are reluctant to exhibit. Second-rate and third-rate people are often not only willing but eager to take advantage of an opportunity of showing their things and advertising themselves.

5. What are the objections of the best class of exhibitors?—They have several objections. First, they think it does not pay. The expenses to a first-class firm are very great, because, to exhibit adequately, they must spend a considerable amount of money, and they do not care to show unless they can show well. Expense is the first ground.

6. Then what would you say is the second?—The second is that, rightly or wrongly, they think the effect of exhibiting their things is that foreigners copy them.

7. In spite of the protection afforded by International conventions and agreements?—Yes. They are not perhaps so much afraid of being literally copied, but they think foreigners get ideas from them, and so are enabled to adopt the same kind of systems. The third objection is the argument one is always met with in approaching the manufacturer, namely, what is the good of exhibiting in a foreign country, when the tariffs are so high that their goods are excluded?

8. You said just now, I think, that the second-rate and third-rate firms were not only willing, but eager to exhibit?—Yes, it answers their purpose as a means of advertisement.

9. That is under what is called the old system?—That is under the old system, by which exhibitors paid all their own expenses.

10. What was the advantage of the old system?—The main advantage was the cheapness of it to the Treasury.

11. What is your experience of the system that foreign countries adopt now?—I think they are much more efficient, and that they enable a much better representation of the industries of the country, as a whole, to be made.

12. What is the system in Germany?—The system in Germany is, I believe, roughly, that the Government pays all expenses, and in return they claim and exercise the right of selecting what goods are to be exhibited. They send skilled people all over the country a long time before the exhibition takes place selecting out of the goods of all the principal manufacturers those which they think it is to the advantage of the general industry of the country to show.

13. Are they permanent officiars that they send round in that way, or are they appointed *ad hoc*?—I cannot tell you that. I have never made a study of the foreign systems, and all that I know is from general knowledge. My impression is that they have some permanent organisation in Germany which is the nucleus of an organisation that can be expanded when an exhibition takes place.

14. Can you suggest any other countries which notably pursue that system?—The United States do, and, I think, the French, too. To the best of my belief, all foreign countries, more or less, follow that system, but Germany is a notable instance.

15. Would you contend that we ought to adopt similar measures?—I think we should, if we are to compete on equal terms with foreign countries.

16. Have you any opinion as to how our manufacturers would like the Government to say what goods they should exhibit and what they should not?—No Of course, our manufacturers are not so much under the control of the Government as manufacturers are in foreign countries; and they might possibly resent any attempt at dictation.

17. Have you had any experience of friction with exhibitors, from your wanting them to exhibit in the way you think best?—There is little opportunity of friction, because, if you propose something which the manufacturer does not like, he withdraws.

18. But still there is friction?—Yes, but it comes to an end quickly.

408. 2000.—Wt. 9616. 10/07.—Wy. & S.

Colonel Sir H. Jekyll, R.E., K.C.M.G.

9 Nov. 1906.

19. That brings me to another point: I suppose their exhibits are more of a collective order than ours are?—Yes. Foreign countries almost universally adopt a system of collective exhibits, and their exhibits are therefore much more effective than the individual exhibits of British exhibitors.

20. How would you propose that we should adapt that German system to this country?—The first thing is to give a great deal more money than we have been in the habit of giving. Then we should approach the manufacturers, and as an inducement to them to allow their things to be shown, we should offer to take all the expense and trouble off their hands.

21. Would that money be voted when we heard of an exhibition or were invited to participate in one, or would you propose that there should be a permanent expenditure every year—in other words, do you suggest that there should be a permanent office for exhibitions?—If we are to continue the policy of taking part in these exhibitions, I think there should be a permanent office ; but it could be a very small one, and the cost need not be great. It might simply be the nucleus of an organisation ; and then, when an exhibition is in full view, that would be the time to expand and increase the staff so as to deal with the matter in a proper way.

22. Would you think it desirable to have the same people who have had experience before?—I think it is very desirable, because the work in connection with exhibitions is of a peculiar nature, and the experience gained in one exhibition is of great value when you are organising another.

23. I suppose you would have some difficulty in getting hold of the men if they were not permanently appointed? The people that you would want would have to be good men, would they not?—I think there should be some one good man appointed *ad hoc*, and permanently kept on. He would probably keep in touch with his subordinates in the previous exhibitions, and would be able to put his hand upon them when he wants them.

24. So you would retain the chief man?—Yes, I would.

25. What post would he hold—would it be the position that you have yourself held?—Yes, it would be very much like that.

26. I suppose you would have to pay him a goodish salary?—You would have to pay him a good salary, but I think it would be well worth while.

27. Have you considered the sort of salary that you would pay him?—I think not less than £1,000 a year, probably.

28. With what office would you associate this Department?—I should associate it with the Board of Trade. I think that there are more points of contact between the Board of Trade and exhibitions than, probably, between any other Department and exhibitions.

29. You are aware, of course, that about forty years ago, when I first joined, the Board of Trade was the Department which had the control, such as it was, but subsequently it went to the Education Office?—Yes, it went to the Science and Art Department. They managed the exhibitions for a long time. Sometimes the Foreign Office did the work.

30. What do you think about the advantage of a Royal Commission being appointed for this purpose?—It is a time-honoured custom to appoint a large Royal Commission, but I do not think it is a convenient instrument for this purpose. A Royal Commission is a very good thing for an inquiry, where a difficult subject has to be threshed out ; but I do not think a Royal Commission is a good executive body, especially when it is numerous and composed of very distinguished people, as these Royal Commissions are.

31. Did it attract exhibitors, do you think, at Paris, say?—No, I do not think so. It has some influence, I think, with foreign countries, because it is taken as a compliment by foreign countries that the exhibition should be directed by a Royal Commission.

32. Politically?—Yes, especially if it is presided over be a member of the Royal Family.

33. Your Commission for the Paris Exhibition did not meet very often as a Commission, I think?—It only met twice as a Commission—once for the opening inaugural meeting, and then there was one closing meeting. It appointed a number of committees, including an executive committee, which really exercised all the functions of the Royal Commission ; and a finance committee, which controlled the money.

34. Those committees met very often, I suppose?—Yes, they met frequently.

35. Do you remember what the German system was in that respect?—I do not think they had anything corresponding to our Royal Commission. They had a Commissioner-General, who, I believe, had large powers.

36. I do not think I have asked you whether you are really in favour of our continuing to take part in these exhibitions?—I am very doubtful whether it is to the advantage of the country that we should continue to take part in them.

37. Even with the improvements you suggest?—That is another point. I am quite clear that it is not an advantage to continue to take part in the exhibitions on the old system, because the result of the old system is that we get an indifferent representation of British goods, which are shown side by side with the best possible representation of foreign goods ; and that, I think, cannot be to the advantage of British industry. If the German system were adopted, there is something to be said for it, but then, of course, it is very costly.

38. (*Sir Isidore Spielmann.*) I think on the Commission for the Paris Exhibition you had over 100 Commissioners?—Yes we had, I think, 120.

39. Can you tell us, roughly, what proportion of them were working members of the Commission?—I should say, roughly, twenty. Though the number who took some part in the work of organisation was considerably larger.

40. And they were all members of the committees?—Yes. Those who did most were almost exclusively the members of the executive and finance committees.

41. You said that manufacturers fear that their goods will be copied if they exhibit at international exhibitions, but does not the same fear apply even in this country? If foreigners want to copy British goods, can they not do so in London just as well as, say, in Paris?—They can, but there are not the same facilities. The foreigner would have to come over here and find out the goods that he wishes to copy, whereas in an exhibition they are all displayed ready for him. I do not think there is very much in the fear, but it is one which is largely entertained by manufacturers, rightly or wrongly.

42. I am quite aware of that—I do not myself attach much importance to it.

43. An international exhibition is really a huge show-room, as it were, but the show-room already exists in London, and the foreigner might stand at a shop window and copy all the things that he sees there, just as well as at the show-case in the exhibition, might he not?—Yes, but then there are a good many things which are shown at an exhibition which do not appear in shop windows, such as machinery, and so forth.

44. But he could buy a machine?—Yes, he can, of course, do that.

45. And so copy it?—Yes.

46. So it is really not a strong objection?—I do not think it is a strong objection, but it is one which is widely held by manufacturers.

47. (*Mr. Malcolm Ramsay.*) I suppose your view, put shortly, is that the results obtained from previous expenditure on commissions have not justified the expense?—It is impossible to give an opinion upon that point without an exhaustive inquiry among manufacturers themselves. It is impossible to say whether exhibitions have done good to them on the one hand, or whether, on the other hand, abstaining from an exhibition would have done them harm. It is a matter of conjecture at the best, and it is only the exhibitors themselves who can really give an opinion upon that point.

48. Have you ever heard any opinion expressed as to the results that we get from our expenditure?—I have heard various opinions from individual exhibitors. Some are quite pleased and others are disappointed.

49. I suppose foreign governments go in for exhibitions upon an elaborate scale rather as part of the bounty system, do they not, and upon the general grounds of policy, quite as much as with a view to any

particular benefit that the individual gets from it?—I cannot tell you on what grounds they go in for it. I should think there are probably very various motives.

50. (*Mr. Wilson Fox.*) Do I understand you to suggest that the Government should pay practically for the whole of an international exhibition, as far as England is concerned, if she joins?—I think so. If it is to be successful they must.

51. It seems to me that the Government might do one of two things. It might pay for all of it, and absolve manufacturers and traders from all expenses; or it might pay for the organising portion of it, and for getting the exhibits on a uniform basis. I do not mean paying such expenses as freight, but of arranging for the space and arranging the exhibits when they got out there and so forth—all the expenses, in fact, which would be incurred in getting a proper organisation. Would you relieve the traders themselves of the expenses which they would naturally incur in exhibiting their things in a foreign country?—I think you will have to offer great inducements to get the best manufacturers to exhibit at all.

52. Would that not lead to this system, that it becomes ultimately an exhibit of governments competing between themselves, so to speak, instead of a competition between manufacturers and traders; and would it not finally resolve itself into the prize going to the government which has laid down the greatest amount of money?—I am inclined to think that that would be the ideal sort of exhibition. I should like to see all medals and awards done away with, and to make it practically a competition between governments.

53. But then the government which put down £5,000,000, say, would be the government that would score the most in the end—it is like the bloated armaments argument?—I do not think it could be swelled into figures of that size.

54. Do you not see any danger of there being a monetary competition between the treasuries of the various governments?—You could not spend more than a certain amount, because the space to be filled is limited.

55. It would do away with the real *bonâ fide* competition of the manufacturers and traders, would it not?—As individuals, yes it would.

56. If the Government were simply to go to a trader and take his goods and exhibit them and then bring them back in a year's time he would have his things shown free, and no expense would be incurred by him. Do you not think that would do away with any incentive to rivalry on the part of traders, and any desire on their part to show really good exhibits?—There would be no competition as among individuals, but it would enable the show of each country to contain the best articles which that country can produce.

57. If the Government insisted upon manufacturers sending their best things?—Of course one condition you must make with the exhibitors is that you shall have the right of selection.

58. At the present time a manufacturer if he were spending a considerable amount of money in sending things over, say, to St. Louis, at his own expense, would take care to send his best things?—Yes; of course he would send the best things that individually he has to show.

59. It would not be worth his while under those conditions to send bad things?—No, but of course he may not be a first-class man.

60. How is it that the first-class men do not show now, and the second-class men do show? Why is it the interest of the second-class man to show, if it is not the interest of the first-class man to show?—Because the first-class man's business is so firmly established that he gets all the orders he wants, and he does not want to advertise himself, whereas the second-class man wants to bring himself into notoriety.

61. There is an opening for him at an exhibition, you think?—Yes, there is an opening for him. The first-class man, if he exhibits at all, has to do it on a large and expensive scale, because he cannot afford to do it badly, whereas the second-class man can do it in a much more moderate way.

62. I do not quite understand why some of these men put forward the high tariffs as an excuse for not showing, because that difficulty applies equally to all countries, does it not? Supposing we were showing in St. Louis and we wanted to push our goods in America, the high tariff would apply equally to the French and the Germans who also wanted to push their goods in America, would it not?—Yes. It is only a disadvantage as against the American who is exhibiting in his own country.

63. Do you think that a British manufacturer shows at a foreign exhibition because he does not like not to show on account of powerful trade rivals who show?—I think that is an inducement very often. It is one of the embarrassing things of a voluntary system that if you get one first-class man who is willing to exhibit, there will probably be two or three others who are on the same level with him in the same business, and who will think it necessary therefore to exhibit also; and in that way you get a great duplication of the same class of goods.

64. Would you say that some men would not show if their keen trade rivals did not show?—Yes; but as soon as the trade rival shows they must come in too.

65. In the report of the Paris Exhibition which you wrote I see you suggest that it would be an advantage if chambers of commerce or manufacturers' associations were to get up exhibits or organise them, in order to get more uniformity in the way they show?—Yes, and to avoid duplication.

66. Supposing the exhibit of goods from Sheffield, say, was organised by the Sheffield Chamber of Commerce and put on a uniform basis, the local manufacturers sending their best things and the exhibits having to pass the Chamber of Commerce; might that not be tried as an experiment, before the whole thing was thrown in the hands of the Government with the danger of these large expenses being incurred?—I think that it would be a very desirable thing to enlist the co-operation of the chambers of commerce and other local bodies too, but I think the expense would be the same. You would have to pay the Chamber of Commerce, because you could not expect the Chamber of Commerce to do it at their own expense.

67. It would probably be the least expensive method of doing it, would it not?—It would.

68. Supposing there was a director of exhibitions in London, and he had the Sheffield exhibit organised for him down there, and then despatched in a finished and concrete form, that would save expense, would it not?—It is not easy in all branches of industry to adopt that system. In the case you are quoting, of Sheffield, the steel industry of Sheffield is, of course, a local industry, and it would be quite possible for some local body to take it up, and to secure a very fine collection of Sheffield goods; but there are other industries which are not localised in that way, and are scattered all over the country.

69. I quite agree, but at any rate it could be done in some trades, for instance, in cotton and woollens?—Yes; the woollen trade in Bradford is an example.

70. It could also be done with the Potteries, probably?—Yes.

71. And probably with glass to some extent?—Yes.

72. May we take it that you would generally approve of an attempt to carry out a system of that sort, if it could be established?—Certainly; I think it could be done in that way.

73. (*Sir James Kitson.*) Arising out of your point that foreign governments are in more direct association with manufacturers, I dare say you saw in Paris the exhibits of Krupp's, of Essen?—No, I did not see them.

74. They exhibited in Paris on a very large scale, and they also exhibited in Düsseldorf, as you may remember?—Yes.

75. It is understood that there are direct relations between Krupp's and the Government, is it not?—Yes, I believe there are very close relations between them.

76. And therefore the Government have every opportunity there of exercising pressure, if you like to put it so?—Yes.

77. And of ordering very extensive exhibits to be made?—Yes.

Colonel Sir H. Jekyll, R.E., K.C.M.G.

9 Nov. 1906.

73. Through their contracts with Krupp's the Government can subsidise Krupp's in regard to their exhibits?—Yes.

79. That, I think, is understood?—Of course they have close relations with them of all sorts.

80. The same thing obtains with reference to Schneider, of Creusot, does it not?—That is the French company—yes.

81. They have direct relations with the French Government in regard to the marine, the artillery, and the rest of it, and the Government can bring pressure to bear on them, and also, what is better than pressure, can give them support. Is that not so?—Yes.

82. Our manufacturers cannot get that by our system of estimates, can they?—No.

83. You were saying there is a reluctance on the part of the great manufacturers to exhibit now?—Yes, there is.

84. Does that apply to the heavy engineering trades, such as the marine engine trade?—Yes, I think it does. I ought to say there are some brilliant exceptions. We had some magnificent exhibits by large people like Mather and Platt, and Vickers, Sons and Maxim, who made a splendid exhibition. But these were exceptions to the rule.

85. Perhaps you could trace the motive; the motive, I imagine, would be to bring themselves before the Governments?—Quite so, in the case of manufacturers of war material.

86. But the object of an exhibition, I imagine, is to bring exhibits before the people?—Yes.

87. That would not be *their* motive; their motive would be to stand well with Governments?—No doubt.

88. You may remember seeing the exhibit of locomotive engines at Paris, do you?—Yes.

89. Were they not all made by the railway companies?—I think so.

90. Those exhibits were made by the railway companies, I imagine, because they interchange information with the administrations of two of the railways in France?—I cannot tell you what their motive was, but to the best of my recollection all the exhibits of locomotives were by railway companies.

91. Were you acquainted with the Exhibition of St. Louis?—No; I was on the Royal Commission, but I was never there.

92. With reference to your point about organisation, if there was an organising staff for the British exhibits, do you think you would find that organising staff would be of very great service to them without the necessity of Parliamentary Grants for the exhibition itself; that is, do you think that the one might exist without the other?—I should doubt whether that would be a sufficient inducement.

93. Do you remember the exhibits in Paris of Leeds cloth?—Yes.

94. And of Leeds leather?—I do not remember the leather.

95. You might cite them, I think, as examples of co-operation in exhibits which you have insisted on in your evidence?—There was an exceedingly good co-operative exhibit of cloth from Bradford. It was organised by either the Corporation or the Chamber of Commerce at Bradford. It was exceedingly well done, and was one of the most effective exhibits in our section. But it was an exceptional thing, and we found it difficult to get different manufacturers in the same line of business to combine.

96. I suggest to you that it is not quite so exceptional as you imagine. I have had some experience, and I think that it has been done in other exhibitions?—It has been done, I know, and wherever it is done, it always succeeds.

97. (*Mr. Waring.*) Are you absolutely clear in your own mind as to the value of exhibitions to the country from a national and from an individual standpoint. Are you quite clear that there are distinct advantages?—No, I am not at all clear.

98. Are you clear that there are distinct advantages under what you would term ideal conditions?—I think that then possibly there might be an advantage. I think the main reason why we take part in exhibitions is often one of high policy—it is diplomatic, so to speak. An invitation comes from a foreign country, and it is looked upon as an unfriendly act to refuse it.

99. That is from the general standpoint?—Yes.

100. And it is what you might call the initiative point?—Yes. But I am not at all clear that when we have accepted the invitation and taken part in the exhibition, it does any good to our industries.

101. I suppose you would divide the question into two classes—one, the national, and the other, the individual benefit or disadvantage?—Yes.

102. Do you think, from the national standpoint, an exhibition conducted under ideal conditions would be an advantage to the nation?—I think possibly it might.

103. Then from the individual standpoint, if it were conducted on the lines you suggest, and as mentioned by Sir James Kitson, on a co-operative basis, that would give you a representation of the most capable houses in a specific line. Do you think there would be an individual value and advantage in that?—I think it would still be a national advantage. The main point is to get the best representation of our industries to be shown side by side with the industries of foreign powers.

104. Do you think there is much individual advantage from a firm's standpoint?—That is a question which can only be answered by asking the firms which have taken part in exhibitions, whether they have found it to their advantage or not.

105. You have not formed any personal view on that point, have you?—I have not, and I have no means of forming an opinion. I take it that there is no justification for spending public money for the advantage of individual firms. The only justification can be that it does good to the industry of the country as a whole.

106. Are you quite clear about the position in Germany—that they pay the whole of the expense?—That is my belief.

107. I asked that question because I understood they paid half?—I cannot answer with any degree of certainty, but my belief is that they pay, if not the whole, the larger proportion.

108. What are your views in regard to the definition of expense?—Do you mean the whole cost of the exhibit, or do you mean such loss as might be entailed upon the manufacturer in exhibiting? You see, there is, first, the original cost, then you have to consider, secondly, the value of the goods as they are brought back, together with the freightage and such matters?—I think he should be compensated for anything that he is out of pocket in the transaction.

109. Any loss?—Yes.

110. In regard to the question of control, on which you have had a great deal of experience, may we take it that by the word "control" you mean a supervisory control? You would not, would you, permit the manufacturer to initiate and suggest himself; there would be an individual or a committee exercising a supervisory control over a representative group, would there not?—I should like to see the names of individual manufacturers suppressed, and I should also like to see awards suppressed, and to have each industry forming a collective exhibit of the best that it could show.

111. What advantage would there be in suppressing an individual name?—I think you want to bring the goods into prominence, and not the names.

112. By suppressing the name, would you not kill largely the desire of the manufacturer to gain such personal advantage as he might otherwise hope to gain?—The great point is that his *raison d'être* for exhibiting is his personal interest?—I think that if the superiority of a particular class of British goods over the corresponding goods of foreign countries could be shown at an exhibition, customers would be induced to come to this country in order to purchase those goods. They would soon find out for themselves who the best manufacturers were. I want to show them that, say, the steel goods of this country are better than the steel goods made in other parts of the world.

113. The great point in these things is the personal equation, and I must confess I cannot see what advantage you will gain by suppressing the name of the exhibitor, whereas I can see great advantage in bringing out his name?—By suppressing his name you get rid of the advertising element, which is so very pro-

minent in all these exhibitions, and, in my opinion, so injurious.

114. (*Mr. Harris.*) To press a little further the point Mr. Waring has just put, do you not think, on further reflection, that possibly if you get rid of the individual element in an exhibit—although I understand what you mean by the benefit to the industry of the country as a whole—the foreigner would be left without any inducement to try and purchase in this country, because he would not know where to go?—I think he would easily find that out. If he is convinced that he can get better steel goods in this country than anywhere else, he will soon find out where to go for the steel goods.

115. (*Sir James Kitson.*) Do you think the buyer would find out the seller if the seller did not find out the buyer?—Yes.

116. (*Mr. Harris.*) So that you think that if you could impress the foreigner with an idea of the paramount excellence of British goods you would gain a practical advantage to British trade?—I do.

117. There is one point upon which I should like to be quite clear. When you speak of the advantages held by the Germans you do not, I suppose, imply prejudice on the part of the foreigner against the British in an exhibition, but you mean that they gain this advantage by their own organisation?—Yes, they gain it by their organisation. I may just illustrate it in this way: A British manufacturer likes to exhibit his own goods in his own way and in his own show-case. He will not submit to any interference or suggestion. He says: "Either I show in my own way, or I do not show at all." The foreigner does not exhibit in that way. Certain of his goods are selected, and they are exhibited by the Government organisation in a large case with similar goods made by others, and the general appearance of the exhibit is much more attractive than are a number of show-cases of different sizes and shapes containing the goods of individual manufacturers.

118. (*Mr. Waring.*) Is that not largely owing to the fact that under the old *régime* they had to pay for everything, and they thought naturally that those who paid the piper should call the tune?—I have no doubt that is so. It is part and parcel of the old system.

119. (*Mr. Algernon Law.*) You said that grants were usually given for diplomatic reasons, but do you not think they are very often given owing to pressure here from people who may be interested in various ways in exhibitions being held?—There is no doubt a certain amount of pressure, but I think the main pressure is one of high policy rather.

120. Do the exhibitors under what you call the old system, which I suppose is the existing system ——?—Yes.

121. Do they all pay their expenses—the packing and all that kind of thing?—In Paris they paid all their expenses of packing and freight, and in earlier exhibitions they even paid for their space.

122. Even for art exhibits?—No; art exhibits stand on a footing by themselves; they are quite distinct. I have only been talking about industrial exhibits.

123. Do some large foreign firms, we will say German firms or French firms, refuse to exhibit?—That I cannot tell you.

124. Can you say whether the colonial system is different from ours, because they seem to combine in a general exhibit in some of the exhibitions I have seen?—Some of the colonies are very keen about exhibitions. Canada, for instance, was exceedingly keen in Paris, and so were the Australian colonies. The only difficulty we had in relation with them was that they were not recognised by the French Government as distinct from the mother country, and the colonies rather resented that.

125. Under the old system I think the Treasury used to refer exhibitions to the Society of Arts, and they managed them. Was that a good system for promoting exhibitions and for making them successful?—I can hardly tell you that.

126. Were all the members of the Royal Commissions members of committees, or were some of the Royal Commissioners merely ornamental? You said in relation to one that 20 members took an active part in the work, but I suppose there were more who were members of committees?—Yes. There were a number of committees formed, and they all took some part in the organisation of their sections.

127. Some members, I suppose, held out altogether?—Yes.

128. When dealing with the question put to you that if one country spent a great deal of national money on exhibitions another might go in for competition in that matter, you said you thought there would be a limit; but did not the Americans spend something like £5,000,000 over the St. Louis Exhibition—was not that amount of money put into the exhibition?—That was in their own country. The expenditure is always large in the country where the exhibition is held, and the receipts are also large.

129. You also said you did not think the Chambers of Commerce could be expected to contribute to the expenses of exhibitors?—You might here and there find a Chamber of Commerce which was willing to contribute, but I do not think you would find a very widespread desire on the part of Chambers of Commerce to bear the expenses of their exhibitors.

130. With regard to the awards, do you find that they are granted to a particular nation in proportion to the number of exhibits in a class?—No. I think the juries try to give their awards in proportion to the merits of the exhibits, as far as they can. But the whole system of awards and juries is a very objectionable one. It gives rise to a great deal of bitterness and ill-feeling, and very often the results are unsatisfactory.

131. And that you would never get rid of, even if we had a very good system of exhibiting?—You can only get rid of it by abolishing the system of awards altogether.

132. (*Chairman.*) Then you would be in favour of agreeing internationally not to have awards at exhibitions?—I would, certainly.

133. (*Sir Isidore Spielmann.*) Do you not think that a very large number of firms, when they do exhibit, exhibit with the sole object of obtaining awards, such as the grand prix or the gold medal?—Undoubtedly they do.

134. Especially those firms who have taken a long string of the highest awards; they cannot afford to remain out and see a younger firm, perhaps, take the award over their heads, is that not so?—I think that is very often the case.

135. Even without any idea of doing business at an exhibition, they go into it solely with the object of taking the highest awards?—I think that is very likely to be the case.

136. (*Mr. Wilson Fox.*) If there were no names of traders given and no awards, it would resolve itself absolutely into a Government exhibit of the products of the country, would it not?—It would.

137. Do you think if the Government paid the whole of the cost of a British exhibit to go abroad, that, assuming present conditions, more traders would consent to exhibit—that is, supposing they were relieved of all cost?—I think so. It would be a great inducement to them, and the whole thing would be lifted on to a higher plane.

138. Would not the Government be placed in this position—that it would be rather invidious for them to have to select to whom they gave this free advertisement, because it would be giving the traders whose goods they sent, a free advertisement in a foreign country?—Not so much in the absence of the names. We are supposing the names to be suppressed.

139. I can quite understand that that would be so, but in the present circumstances, supposing the names were sent, the Government would be practically giving the firms they select a free advertisement in a foreign country?—Yes, they would.

140. Which might give rise to considerable discontent among the firms who were not selected?—Yes.

141. (*Chairman.*) You are giving me the idea that you consider that one country has to show superiority over another country in a whole collective exhibit; but do you not rather recognise that in these days it is by certain specialities that one country excels another?—I think that each country should concentrate its efforts upon its own specialities; and some countries do, with great success. For instance, at Paris the principal Swiss exhibit was one of watches,

Colonel Sir H. Jekyll, R.E., K.C.M.G.

9 Nov. 1906.

in which they excel; they did not attempt to compete in a great many classes of goods in which they do not excel.

142. So you do not think that the whole of a collective exhibit, even in a big class, would be superior in one country; there would be certain specialities which would be better in one country, and others which would be better in another?—Undoubtedly.

143. Having regard to that consideration, do you think you could safely suppress all the names of the exhibitors?—(*Sir James Kitson.*) Need the names be entirely suppressed? The Bradford exhibit we have referred to, for instance, was a collective exhibit, but a list of the names of the contributing manufacturers was given, so that the inducement to a manufacturer to take part in the collective exhibit of one industry might still exist?—Yes. In the case you have mentioned, you could not identify any particular piece of cloth as being made by any particular manufacturer. It was a joint exhibit of a number of the principal manufacturers of Bradford, who all showed their goods in the same case.

144. Does that come near to what you would prefer?—Yes.

145. (*Mr. Waring.*) Do you think it would be an advantage to hold a great international exhibition in England at an early date?—I do not think it would for industrial purposes; it might for political purposes, but not for industrial purposes.

146. May I ask what you mean by "not for industrial purposes"?—It is a very difficult thing to make an exhibition effective which covers the whole field of art and industry. It is such a gigantic enterprise, and yet it has to be done in a comparatively short time. I am much more in favour of small local exhibitions of particular industries, than of attempting to combine all industries into one huge show.

147. Then you do not attach much importance to the mammoth influence of a great impressive exhibition on the manufacturing world?—No. Of course it does a certain amount of good to the place where the exhibition is held, because it attracts a large number of visitors, and they spend money.

SECOND DAY.

Friday, 16th November 1906.

PRESENT:

Sir Alfred E. Bateman, K.C.M.G. (*Chairman.*)
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G.
The Rt. Hon. Sir James Kitson, Bart., M.P.
Mr. Algernon Law.
Mr. Malcolm Ramsay, C.B.
Sir Swire Smith.
Sir Isidore Spielmann.
Mr. S. J. Waring.
Mr. U. F. Wintour (*Secretary.*)

Colonel Sir Charles M. Watson, R.E., K.C.M.G., C.B., called, and examined.

Colonel Sir C. M. Watson, R.E., K.C.M.G. C.B.

16 Nov. 1906.

148. (*Chairman.*) I think you were connected with the St. Louis Exhibition of 1904?—Yes; I was secretary of the Royal Commission, and Commissioner-General.

149. I suppose you had to do with the whole of the arrangements?—Practically I had. I was a member of every committee, and I also had to take charge of the transport and of the installation at St. Louis.

150. When did the work begin?—A Committee was appointed by the Foreign Office in February, 1903, and that was turned into a Royal Commission on the 23rd April, 1903.

151. (*Mr. Wilson Fox.*) Is it the year 1903 you are now speaking about?—Yes; our work practically began in February, 1903.

152. (*Chairman.*) How did you begin?—The first thing we did was to write a letter to a great many manufacturers, to find out what steps they would take as regards supplying exhibits. We also communicated with, I think, 100 Chambers of Commerce, to see if they would be willing to help us in organising a good British exhibit; but we got very few answers, and after the Royal Commission was appointed, we sent out another circular to nearly 9,000 different manufacturers.

153. What reasons were given why they did not exhibit?—There were varying reasons. Some said it was on account of the high tariff in America; some said it was because they were so busy that they could not be troubled; and a good many said that they did not care about exhibitions, as they did not think exhibitions did them any good, and therefore they would rather be excused.

154. You visited some of the manufacturing districts, I think?—Yes. I went to some of the most important manufacturing districts to try and ascertain if by conversation we could draw them in; but I did not meet with any strong support. For instance, I went to the Chamber of Commerce at Bradford. I went to Bradford especially because they had had a collective exhibit at Paris; but I found that they were not at all anxious to take part in the St. Louis Exhibition. As a fact, of the Chambers of Commerce that we communicated with, practically none gave us their assistance.

155. You did not propose a collective exhibit at that time, did you?—The collective exhibit idea was started after the Royal Commission had been appointed. The Prince of Wales, in his speech at the first meeting of the Royal Commission, laid a good deal of stress upon the advantage of getting collective exhibits, if it was possible.

156. Was that in order to induce manufacturers to exhibit?—It was to try and induce them to come in.

157. And was it also in order to make a better show?—What we were anxious about was to get a good show; and we found that it would be quite impossible to get a show at all in the Department of Manufactures if we did not go in for collective exhibits.

158. You had individual exhibits as well, did you not?—We had a certain number, but only a small number, comparatively speaking. I think our total number of exhibits in the collective exhibits was nearly 800, but of individual exhibits I think we only had 89.

159. So that the proportion was about ten to one?—Yes.

160. Which was the most important of the collective exhibits?—The chemical exhibit was the most important one. It was a very admirable exhibit. It was organised by Sir Boverton Redwood and Mr. Salamon, who were two of the Royal Commissioners. They got together a really splendid collective exhibit of the chemical industries. We had goods from

97 different chemical manufacturers, many of whom had previously refused to exhibit at all; and the exhibit was arranged in such a way that every manufacturer's name was shown, and he had a special part in the exhibit to himself.

161. Do you think it important to show the name of the exhibitor?—I think it is absolutely essential. I do not think you would get people to come at all if you did not give their names.

162. Do you think they would not come if it were to advertise their country only?—I do not think it would be possible to get them on that ground. There is one point I might mention here, and that is that, even if they had been willing, we could not have done so under the exhibition regulations; because the regulations of the St. Louis Exhibition, as, I think, of most exhibitions, laid down that the goods must be shown in the name of the manufacturer.

163. You had other collective exhibits as well as the chemical exhibit, I understand?—Yes. We had several very good collective exhibits. We had a good one of lace and embroidery in the manufactures section; we had one in ceramics; we had a good one in sporting guns; and then we had other collective exhibits which were not in the line of manufactures. We had, for instance, photography, geography and exploration, books and typography, and civil engineering.

164. You say you attracted the exhibitors by having collective exhibits; was the system of collective exhibits any help to you in assisting you to get the best goods?—There is no question about it, because with the collective exhibit plan you simply say what goods you want, and ask manufacturers if they are willing to supply them. You have it entirely in your own hands to get a good collection of articles together.

165. Did you get a good number of awards?—Yes, we got a very excellent number. Possibly you know the arrangements under which exhibitions give awards to collaborators who have assisted in exhibits, as well as to the actual exhibitor; that is, in the case of, say a beautiful china vase, the exhibition would probably give a grand prix to the manufacturer of the vase, and a gold medal or a silver medal to the designer of the vase. Leaving out the collaborators, of whom we had a good many, we got 126 grands prix, 204 gold medals, 129 silver medals, and 77 bronze medals.

166 (*Mr. Wilson Fox.*) What was the proportion of those awards to the exhibits?—Nearly one per exhibit, I think.

167. (*Chairman.*) So that practically everybody got a prize?—Yes. The American jury said they thought every one of our exhibitors ought to get a prize, the exhibits were so good.

168. That is very satisfactory?—Yes; they used very enthusiastic language about it. I could tell you the total number of our exhibits. In regard to the education exhibit, we did not go in for awards at all, and in regard to the art exhibit we did not go in for awards; but if you leave out the exhibits in education, art, and applied art, we had about 730 exhibitors, and we got 536 awards.

169. I should like to get from you the reason why manufacturers do not care to be represented at exhibitions abroad?—I talked to a great many manufacturers about it, and the general feeling appeared to be that it did not seem to do very much to help their particular industries, and they were doubtful whether the volume of trade was increased by the fact of showing in foreign exhibitions. It struck me—of course I speak under correction—that a good deal of it was due to the way in which British trade is conducted; that is, the manufacturer very rarely, in the case of ordinary manufactures, gets into touch with the person in the foreign country who wants to buy his goods, and the trade all passes through the hands of what I may call middlemen or agents. I had one or two rather curious instances of that in the St. Louis Exhibition. We were very anxious, for instance, to get a good show of British needles, of which a large number are sent to America, and I could not get any needle manufacturer to exhibit for one reason or another; but when I was at St. Louis an American merchant came to me and said he wanted space in the British section to show British needles. I said to him, "But what name are you going to show them under?" He said, "Of course, my own name." "Not the names of the manufacturers?" I said. He replied, "No." Then I explained that under the regulations he could not have space.

Colonel Sir C. M. Watson, R.E., K.C.M.G., C.B.

16 Nov. 1906.

170. Were his needles from Redditch?—I do not know where he got his needles from; but I went to Redditch, and saw the leading people there, and they with one accord said it was not worth their while to show.

171. The agents do not want to show the names of the manufacturers?—No, I think not; and that is natural. I do not see why the man in America who buys the goods should want to let his rivals know whom he has bought them from.

172. What is your suggestion to get over that?—The only way is to have collective exhibits, and then the Government pays for sending the things over. But, of course, that would be giving an advantage to the manufacturer at the expense of the Government.

173. Would the manufacturer pay nothing?—In the case of our collective exhibits he paid nothing. We found that was the only condition upon which we could get them.

174. I see there is a charge in your accounts for St. Louis for exhibits, so that you paid for them?—I think you will find that the charge for the cost of exhibits was something very small, and I think I could explain that.

175. If you please. Will you take one class?—I will take the chemical exhibit, for instance.

176. I see the cost of those exhibits was just under £2,500?—Yes. That was spent almost entirely on buying a plant for showing low temperature experiments. You will see we take credit for that at the end, because I succeeded in selling it to the American Government, and we got a very good price for it. They wanted it for their Bureau of Standards in the Department of Commerce at Washington, and they had been going to purchase a low temperature plant from the same people we had got ours from, so they were very glad to get it rather cheaper from us. It was therefore good for both parties.

177. That is larger than the other classes. Take the class of instruments of precision; I see there that the cost of the exhibits is £138 out of a total of £800; I suppose that would be for instruments to test?—No; it was principally for an exhibit organised by the Royal Mint. Speaking as a rule, we paid nothing for the exhibits.

178. On the other hand, a great item in your balance-sheet seems to be salaries?—And transport.

179. Salaries, entertaining, and travelling were all very large?—The travelling was a necessary thing, on account of the staff. It is so in every exhibition, especially with distances such as you get in America, where travelling and living are expensive. There the subsistence allowances had to be made high on account of the expense of living.

180. Under exhibits the salaries come to £9,000, and the travelling to about £6,000?—The total travelling came to more than that.

181. I was giving the figures from the exhibit section only, but under the general head salaries come to £9,000, travelling to £10,000, expenses of jurors to £2,400, and entertaining to £1,300; so that altogether in those classes you get nearly £40,000?—Yes.

182. Is that more than would be the normal?—It is rather less than it was at Paris. I thought it would be worth while making out what the same items were in Paris. Our salaries and wages were £9,483, not including those in connection with the collective exhibits, and at Paris they are put down as £14,960; our entertaining was £1,346, and at Paris it was £1,660; and the jurors at Paris were £3,233, against £2,489 for St. Louis. So that in this respect we were not excessive.

183. Do you think that may be taken as normal necessary expenditure?—There is no getting out of it if the thing is to be done on a proper scale.

184. You must have all that entertaining?—You must do it. The entertaining is half the importance of the exhibition.

185. (*Mr. Wilson Fox.*) That is the opinion held by those who are entertained, I suppose?—It is essential. We could not allow the French and the Germans and the Japanese and all these people to entertain everybody, and not return it.

Colonel Sir C. M. Watson, R.E., K.C.M.G., C.B.

16 Nov. 1906.

186. (*Chairman.*) Those figures do strike people outside as rather large?—I was most economical.

187. I am sure you were?—I was careful with every penny, and I kept it down as far as possible.

188. Yet, here there is a large expenditure of £40,000 for salaries, entertaining and travelling?—From some points of view the entertaining was a more important thing than the exhibits. It should not have been so, perhaps.

189. Now, I should like your opinion whether any particular exhibition has had a beneficial effect on particular trades?—I think it is a most difficult thing to give an opinion on that.

190. Do you feel it to be so?—I do. I have known some of our exhibitors say that they were very well satisfied. For instance, I think Messrs. Doulton sold the whole of their exhibit; at least, they told me they sold it all. Then Messrs. Birch, who had a very fine exhibit of furniture, sold the whole of their exhibit; and the linen people from Belfast and Dunfermline, and one or two others, I believe, did very well. Then Messrs. Baker, of Willesden, who made baking machines and confectionery machinery, I believe, did very well; at least, Mr. Baker told me so, and he really seemed quite satisfied.

191. According to the accounts, which I have just glanced at, there were no sales except in the art section?—These accounts do not show any of the sales of private exhibitors. These accounts only show the sales of the collective exhibits. I know nothing officially as to what the private exhibitors may have done; I only know of it in conversation.

192. I notice that £7,000 to £8,000 is the amount of the sales of works of art, and that there are amounts of about £500 in other sections?—Practically, we had nothing else to sell except lace and china.

193. You are still speaking of the collective exhibits?—Yes; we had nothing to say about the sale of private exhibits.

194. What you have told us just now is outside those sales?—Entirely. The private exhibits are not alluded to in these accounts, and we do not know what it cost the different exhibitors, or what they made.

195. Your chief point seems to be that Great Britain cannot wisely decline participation in these exhibitions?—Take the case of St. Louis. Supposing we had been the only country not there. There were 40 countries exhibiting, and every country in the world was there except Switzerland. If we had remained away it would have been very marked. I do not see how we could have stopped away.

196. (*Mr. Wilson Fox.*) Do you mean that our absence would have been marked from a diplomatic point of view?—From a political point of view.

197. I mean from a political point of view. It could not be marked from a commercial point of view, because, as you say, you could hardly get the people to exhibit?—The point is, is the whole object of the exhibition to exhibit manufactures, or is it to show a friendly feeling between the different countries? That, of course, is going beyond my scope, so to speak.

198. (*Chairman.*) Our first object here is to consider the effect on British trade, and what is good for British trade?—As a fact, we could have had a very fair exhibit if we had not had any manufactures at all. I have here a catalogue of our whole section (*exhibiting same*). These pages are the only ones that are devoted to the Department of Manufactures.

199. And what is the rest of the book concerned with?—The rest of the book deals with art, education, liberal arts, photography, civil engineering, and all the other different exhibits.

200. As regards the method, do you think a Royal Commission is satisfactory?—I think it works most satisfactorily. The majority of our Royal Commissioners took a great deal of interest in the exhibition, and worked very keenly, especially, as I have mentioned before, Sir Boverton Redwood. If it had not been for him and Mr. Salamon, we would never have had that chemical exhibit. It was all due to personal hard work on their part. Then, if you take the exhibition of books and typography, Sir Maunde Thompson, the head of the British Museum, worked very hard at it: he saw every book himself, and practically organised the whole show.

201. I think you have something to say to us about the present system of dealing with International exhibitions?—Yes. I think there ought to be some permanent office where the records could be kept, and where, when an International exhibition came on the *tapis*, the matter could be considered whether the British Government should be represented or not. At present, everything is started afresh when a new exhibition comes, and the information is found to be distributed. I think the greatest amount of information about exhibitions is to be found at the Society of Arts; Sir Henry Wood would, I am sure, tell you about that. Then, there is more information to be found at South Kensington; there is more at the British Museum; and all the records go to the Record Office, and all the books go to the Treasury. So that, really, you have to start afresh and gather things together. I had an immense amount of trouble at starting. My argument is, that there ought to be some place where there would be a library of exhibitions. Supposing, in ten years' time, there is another exhibition, whoever has to start it ought to be able to go to this office and find all the records about previous exhibitions. That would save infinite time and trouble.

202. This office would be an advisory department, I suppose?—Yes.

203. You would not propose that they should be authorised to begin spending money?—Not a penny.

204. I am afraid the Treasury would not allow that?—The Treasury should not allow it.

205. This office would have the right to advise what could usefully be spent?—Yes, and more especially what should be spent; but the decision must remain with the Treasury.

206. What sort of sized office would you contemplate?—It might be a very small office. The main thing is to have a place where you can keep the library and the records. We have a great many books, for instance, in our office now, and when our office comes to an end, as it will shortly, those books will all be scattered. In the case of the Paris Exhibition, I believe a good many were sent to the Society of Arts and to other places; but Sir Isidore Spielmann would know about that.

207. Shortly, what are your conclusions on this point? I think you have an opinion as to the British Government taking part or not in these exhibitions?—In some exhibitions, like that at St. Louis, I think the British Government would have had to have taken part, even if no manufacturers had come in at all; but I think the British Government should not take part in them, unless they do it on a sufficiently large scale to keep up the credit of England. I think small votes to exhibitions ought to be avoided.

208. Do you think that in keeping up credit, they are bound to spend as much as another country, Germany, say?—We did not spend nearly as much as Germany.

209. Did we not?—No, nothing like it. I suppose that at St. Louis Germany spent two or three times what England did.

210. What about entertaining; did they entertain more or better than you did?—I think they must have spent more in entertaining. France, I believe, spent a good deal. Japan did not spend so much, though I think as regards exhibits that probably Japan was one of the first.

211. What do you think about small grants in aid of private efforts?—I think it better not to give those, because when the British Government gives a small grant, then the other countries think the British Government is supporting the Exhibition, and the result is not equal to the dignity which the British Government ought to maintain.

212. Then, I take it, you would either have a Commission or something equivalent to it, or not take part in the exhibition?—Either that or nothing.

213. Your last recommendation, I understand, is that which we spoke of just now, namely, that there should be an office established?—Yes.

214. Should that office keep in touch with Chambers of Commerce?—I think that would be very advisable. Probably, in the course of time, it would eliminate the difficulties that there are now with Chambers of Commerce, because it could find out whether such-and-such Chamber of Commerce would like to be represented,

and would like to take part in exhibitions. At present, it comes upon the Chamber rather suddenly, and they decide, probably rather suddenly also, that they do not want to participate.

215. I think you told us earlier that you visited some of these Chambers?—Yes, and we wrote to a good many.

216. Did you visit a good many?—I went to Bradford and Leeds, but I think those are the only two I visited personally.

217. And you did not find that they were anxious to help you?—Not in the least, in fact, it was quite the reverse; they said it would do them no good, and that their members would not help.

218. And even in the result, the manufacturers did not help you very much?—Not very much.

219. (*Mr. Algernon Law.*) Do you know what was the result of the chemical exhibit in the matter of business, as shown by the sales?—I do not know, and I can give you no information about that. Sir Boverton Redwood, I think, would probably give very good information on that point

220. Why do the exhibition authorities always insist on the names of exhibitors being given; is there any reason for it?—I must say that I think it is a very good rule. I think it is an essential rule that you should know who made the article. I would like to read the rule as it was at St. Louis—Section 1 of Article 7, "Exhibitors of manufactured articles must be the manufacturers or producers thereof." The object was to prevent agents showing; they wanted to get the actual producer to show.

221. You have given us the proportion of the awards to the British exhibitors; what relation did it bear to the proportion that other countries had?—I do not know, as I have not worked it out. We have never seen the list of awards of other countries. It is rather a pity, but the exhibition authorities up to the present day have never published a full list of the awards, so we do not know at all what awards the other countries have received.

222. Then, as regards the objections raised by agents, do you know whether foreign firms employ agents?—I do not know whether that practice produces any effect in the case of the foreign firms or not.

223. A good deal of money is usually spent on the pavilion is the pavilion of any practical use?—I think it is essential. We could not have got on without it at all. It was required for reception, and it had all the offices of the Royal Commission Staff in it. These are absolutely necessary.

224. You used it, did you?—I think the British pavilion and the British garden was one of our best exhibits. We used the British garden to exhibit the horticulture. We had as exhibitors seedsmen from various parts of England, and we planted a succession of flowers during the period of the exhibition, and they were judged on the results of seeds, so as to keep the garden nice the whole time of the flowers. One of our most effective exhibits was the British garden.

225. But you could have had the garden without the pavilion?—You must have a pavilion for offices and also for entertainments, if you want to do the thing properly. Every country had a pavilion there, and not only had every country a pavilion, but nearly every State of the United States had a pavilion.

226. Is it necessary that pavilions should be built of such substantial material as they usually are?—Ours was built simply of wood, with a cement coating; it was all timber.

227. Yet, it cost a large sum of money?—I think it cost about £26,000—about the same as the Paris one, I think.

228. (*Sir James Kitson.*) When you say that the pavilion and the garden were effective, do you mean effective in point of business return, or effective as a show and an entertainment?—There was no business return from the pavilion.

229. (*Mr. Wilson Fox.*) What was the value of that pavilion after the exhibition was over?—Practically nothing. It is rather curious that our pavilion is the only one that was left standing. It was considered that it would be advantageous to keep it as part of the university—our pavilion stood on the university grounds—and so the university people took it over at a very small value, just a nominal value. If they had not taken it over, we would have been put to the expense of pulling it down, which would have cost a considerable sum. All the other countries had to pull their pavilions down.

Colonel Sir C. M. Watson R.E., K.C.M.G. C.B.

16 Nov. 1906.

230. (*Mr. Algernon Law.*) If it were known beforehand that the United Kingdom never exhibited, do you think that would have any effect on foreign countries, and that they would not be so much disposed to send exhibits to exhibitions?—I hardly like to give an opinion on that subject. I am inclined to think that when a big exhibition comes, the Government will have to take part in it whether they like it or not.

231. In regard to the proposed office, I suppose you were able to get the papers relating to the Paris Exhibition?—Yes; but it was a good deal of trouble—we had to send to the Record Office for them.

232. If you had sent to the secretary of the Paris Exhibition, Sir Herbert Jekyll, he would have been able to give them to you, would he not?—He could only tell us where they were. It would have certainly saved me a great deal of trouble if I had not had to go to various places to get hold of the papers. I think there ought to be a place where outsiders could go and find out about exhibitions. It is quite likely you would have more people willing to exhibit if there were some office where they could go to obtain information on the subject beforehand. At present it seems to be regarded that there has never been an exhibition before, and so the whole thing is started afresh. I should like to have a library with all the exhibition literature, so that any manufacturer could come in and read the reports of all the countries about the results of any previous exhibition.

233. (*Chairman.*) Those would be always on record?—Not only on record, but ready for reference.

234. And they would show that somebody or other had got a big prize?—Yes.

235. (*Sir James Kitson.*) Do you know that such a library exists as far as the iron and steel trade is concerned?—That is quite likely.

236. Mr. Bennett Brough, the secretary of the Iron and Steel Institute, has one?—No doubt; but if they are only arranged for special trades like that, you would have to go about from one place to another.

237. (*Mr. Harris.*) Following up Mr. Law's last question, do you think that you were put to any material expense in searching for the papers relating to the Paris Exhibition? If you had had the library of which you have been speaking, would there have been a money saving?—I do not think I could say that. It would have been a saving of time and a great convenience.

238. You said just now that Germany spent much more on their exhibits than we did; did you form any impression as to whether they got a greater practical return?—No. I could not say that, because one would not know that for a year or two after the exhibition. It was said that Germany spent £300,000.

239. Ordinary gossip did not give any information as to any practical return that they had?—No; besides, the results would not have been known in St. Louis itself

240. (*Mr. Malcolm Ramsay.*) Do I understand that at St. Louis British trade, as a whole, was very inadequately and very patchily represented?—Yes, certainly.

241. A large number of the most important trades were not represented at all, were they?—That was so; for instance, we had no cloth exhibit, and cloth, of course, is one of our greatest manufactures.

242. And you had no steel, had you?—We had no steel, and we had no machinery. We practically gave up trying to exhibit in the machinery department. As it was, there were two or three trifling British exhibits in the machinery department, but as a whole we had no show at all. We could get no machinery firms to exhibit; they said it was not worth their while.

243. When you organised your collective exhibits, did you get any help from Chambers of Commerce?—No; practically it was all done by the committees.

244. Direct with the manufacturers?—Yes.

245. That is, you went direct to them?—Yes.

246. And you had nothing in the shape of local organisations to tell you which were the best firms?—No.

Colonel Sir C. M. Watson, R.E., K.C.M.G., C.B.

16 Nov. 1906.

247. Do you think that if we were to attempt to introduce a collective system into this country, manufacturers would come in generally; I mean, if we were to try and follow what I understand to be the German method, namely, insisting on all exhibitors' exhibits being collective, could we get a complete representation of the country, or would manufacturers stand out?—I do not know I think it would be a difficult piece of work, but we would certainly get a much better exhibit by that means than in any other way—much better than by depending on individual manufacturers.

248. Did I understand you to say that we ought not to participate in exhibitions in future, unless we adopt the collective system?—My own personal feeling is that it would be better to make that the rule.

249. Have you formed any idea of the sort of sum which we should have to give in future to secure adequate representation on the lines you suggest?—It would be very difficult to say. I think it would be necessary to work it out for each special trade before you could do that.

250. Would you think participation on collective lines would involve more money than was spent on the St. Louis Exhibition?—It would depend whether you had more collective exhibits. Take, for instance, our chemical exhibit, which I think was a typically good example of a collective exhibit; that collective exhibit we know cost about £10,000 to the Government.

251. I am trying to arrive at some idea of the least possible figure at which this country could be adequately represented. Our grants have ranged from small sums up to £150,000, the grant for St. Louis, which was the biggest grant that has ever been promised, and which was not all spent?—That is so. I do not think at a large exhibition England could possibly do it for less. Supposing, for instance, that we had tried to do it at St. Louis for £30,000, say, as was originally proposed, I think we would only have made a mess of it. My own personal view is that we should have shown very badly before the other nations, and I am quite sure we would have been much better out of it altogether.

252. Of your expenditure at St. Louis, a very large proportion was what one may call unremunerative expenditure?—Yes.

253. The bulk of it was on education, art, the applied arts, and typography, and the amount spent on the show of manufactures and trade was very little?—That is. a small proportion.

254. As regards your suggestion of an office which would advise about exhibitions, I presume that that office would not advise until the Foreign Office or the Government had considered any invitation received, and that they would then only speak as to the details of ways and means, etc.?—I think they ought to keep their eyes open, as it were, so as always to be ready to give an opinion as to the prospects of exhibiting at a particular exhibition. I do not think they ought simply to be an office of record.

255. But their functions would be merely advisory?—Purely advisory.

256. The decision would rest with the Government, naturally?—Yes. They ought also to keep the records; that would be a very essential part of their work.

257. (*Sir James Kitson.*) You were speaking of the immense amount of preliminary work that was required, and you referred to your appeals to manufacturers, and so on. Can you tell us what was the staff that you employed in sending out all those inquiries and conducting that correspondence? Is it a large staff that you ask for?—The staff for the St. Louis Exhibition is given in the report.

258. You did a great deal in calling different meetings, and so on; I remember I attended some?—Yes. Our staff was about 20 in number.

259. Do you know the cost of that staff?—The total cost for the salaries and wages of the staff for the whole time was £9,483.

260. Supposing you had an organising secretary simply to organise the appeals, what would be the preliminary cost then, do you think?—It would be rather hard to give that.

261. The figure you have given us, I take it, is the total cost in connection with the exhibition?—Yes. No part of the work was treated as preliminary; as we worked on, we gradually increased the staff. We started with two clerks, and then, as the work increased, we added to the number of employees.

262. I want to suggest to you that if there was an organising staff, which made all these preliminary inquiries, its cost would be separate from the cost of running the exhibition?—Quite so.

263. And it might be that you could lessen the latter cost by having that organising staff?—I quite think that.

264. Can you give an idea what the cost of maintaining that organising staff would be?—I would not like to give that; that would require some consideration.

265. (*Chairman.*) Could you give us, later on, your estimate of the cost of a permanent office, such as you would like to see?—A very small staff would do. I will think it over, and see if I can send you that information.

266. (*Sir James Kitson.*) You had a good deal of experience, apparently, in visiting various Chambers of Commerce and so on, and you received, I understand, discouraging replies from those that you met?—Yes.

267. Had those people who discouraged you had experience in exhibitions?—I could not say.

268. Had they found that it really did not answer their purpose to exhibit?—That is what they told me.

269. That was the answer they gave you?—Yes. For instance, I had a long talk with the Master Cutler of Sheffield over it, and he said he would do his best to get the Sheffield people to come in; but afterwards he told me that there was not one person in Sheffield who would participate, and we had not one. He said it was not worth their while.

270. You would advocate exhibitions from the point of view of maintaining the prestige of the nation?—That is a point.

271. But not from the point of view of the commercial result?—Unless, by some means, the manufacturers could be induced to believe that it would be good for them. I do not think at present they believe it; it is possible that they may be wrong.

272. Will you be surprised to hear of an exhibitor at St. Louis who received a grand prix, and also a further grand medal, and who, after all this time, has had no commercial result whatever?—I think it is very probable, and I can quite believe it.

273. You have given some information to the Committee about the Americans not desiring to publish the names of manufacturers; do you know that the selling agents in America are merchants, so to speak, who are agents for particular firms, and have exclusive rights of selling for those firms?—I understood so.

274. And commercially they guarantee the accounts?—Yes.

275. Therefore, it is quite patent that they cannot allow the names to be published, so that their consumers could go direct to the manufacturer?—That was my idea. I might mention another case. I have already referred to the needle manufacturers. I had also a visit from an American agent, as I think you call them, who said he wanted space in the British section to show velveteens. He said that he imported annually about four million dollars' worth of velveteens, and he wanted to show them. I said exactly the same thing to him; I said, "Is the name of the manufacturer to be shown?" "No, certainly not." Then I said, "You cannot have space." He said that he actually got four million dollars' worth of finished velveteens from England every year for sale in America, and he wanted to bring those to the notice of his customers in the South.

276. (*Chairman.*) But in his own name?—Yes. That bears out Sir James Kitson's statement.

277. (*Sir James Kitson.*) I think it explains the position quite clearly?—Yes.

278. (*Sir Swire Smith.*) You think it very important that the display should be collective, and that the State should bear the expense of it?—I think that is the more satisfactory way, and it is the way which is followed, I believe, by other countries, such as France and Germany, and, I rather think, Japan, but I am not sure about Japan.

279. Under that arrangement, how should the selec-

tion be made?—By the committee who is in charge of the collective exhibit.

280. By this means, I presume—that committee would go to some eminent manufacturer, probably?—The committee, probably, are people engaged in the trade themselves.

281. And they would persuade him to send his goods at the expense of the State, and then, if a medal or some important prize was given for those goods, I presume the manufacturer would get the benefit of it?—Yes.

282. That is, the medal or the prize would be given to the maker of the goods?—Yes, of course.

283. Although he had been at no expense in contributing to the cost of the exhibition?—That was the case at St. Louis. With all our collective exhibits it was the makers who got the prizes, not the committee.

284. But it would be very important, in your view, that the committee should make the selection?—Yes.

285. Now, what should that committee be—should it be a State committee or a local committee?—I think it is much better that it should be a central committee. Take, for instance, our chemical committee, which was a very good example. The chemical committee was composed of Sir Boverton Redwood, Mr. Gordon Salamon, Mr. Tyrer, and Mr. Wightman, who are all, I think, connected with the chemical industries. Then you might take our machinery and electricity committee as another instance; Sir James Kitson was on that committee, and also on the transportation committee, I think.

286. You pay the expenses of the collection, and the difficulty which arises in my mind is how you should discriminate between the goods of one manufacturer and the goods of another; because you are evidently going to favour somebody, if you can almost guarantee beforehand that a manufacturer shall get a medal or some prize for his exhibit?—I do not see how you can do it otherwise. Take, again, the case of the chemical exhibits; the committee there decided who were the best chemical manufacturers. I suppose they probably wrote to 200 or 300, and out of those 200 or 300 they got 97 to agree to exhibit. Of course, some people will never exhibit, even in a collective exhibit.

287. In a collective display your object would be to get the best productions from every industry?—Yes.

288. In so doing would you not favour a local competition or a competition among all the producers of these goods, so that the Committee could select the best without our knowing at the time the names of the makers?—I think the Committee would have to know the names of the producers.

289. I suppose it would always be open to manufacturers to exhibit on their own account by bearing the expenses?—Yes.

290. You have spoken of the significance of entertaining; who were the people who were entertained, I mean, what was the class of people whom you entertained?—In the first place, there were Commissioners from 40 different countries, and of course they had to entertain one another. Then, there were all the exhibition authorities, who were very numerous; and then there were all the different State authorities; there are 45 States in the Union, and every one of those had a Commissioner-General and a staff. Then, of course, we had a great many people who came down from Washington, and from the east of America, and from the west of America. Really, the social functions formed a very important feature of the exhibition.

291. What would you consider to be the proportion of cost between the exhibits of manufactures and the exhibits of those other more popular things? The manufactures figure up very small in number, apparently?—Yes.

292. I am wondering what would be the proportionate cost?—Our actual cost on the lace and the embroidery exhibits in the manufacturing department was £4,300, and on ceramics £1,800. Those were the only two collective exhibits we had in the manufactures department, unless you class the chemical exhibit also among the manufactures.

293. I should?—That cost £10,000.

294. Would you consider that visitors take very much interest in the exhibits of manufactures?—I think those who are interested in the manufactures do, but the ordinary individual does not take very much interest in them.

295. Then it is rather a small proportion of the visitors who take an interest in them?—A small proportion. Most of them just walk through the house.

296. (*Mr. Wilson Fox.*) A great many of the traders and manufacturers in this country, no doubt, thoroughly understand the art of pushing their goods and of advertisement?—Yes.

297. And many of them have come to the conclusion that that particular form of advertisement which consists in sending their goods to a foreign exhibition is not a paying one?—Yes.

298. In those circumstances, if the British Government try to advertise those goods, instead of the gentlemen who thoroughly understand the art of advertisement, do you think the British Government are likely to be more successful than they?—Some of the manufacturers do not think so. I have asked them that question, and they say they would rather be left to do it in their own way. One manufacturer, in particular, I recollect, said he wanted the Government to let him manage his business in his own way; he said, "For God's sake, let the Government leave me alone."

299. A witness said on the last occasion when we were here that British second-class manufacturers and traders were showing in exhibitions abroad more than the first-class ones were, and the reason he gave was that the first class traders and manufacturers had made their name, and therefore it was not so essential for them to advertise their goods in foreign exhibitions. I put it to you, may not that equally be said of Governments, and may not a backward country with a small trade find it much more necessary to advertise its goods at exhibitions than a great manufacturing and trading country like England, who has made her reputation?—I think it is quite possible. Some of the South American States, for instance, did a great deal to push their business at the Exhibition. The Argentine, Brazil, and Chili, all made very good shows, and they were evidently very anxious to push their business. The same may be said of Cuba and Mexico. Another country that really made an excellent show for a small country was Bulgaria. Those small countries were very anxious indeed so I agree with the point of view you put forward.

300. In the *précis* of your evidence you say that one of the reasons for British manufacturers and traders not showing their goods is, that they are afraid of having their goods copied abroad; it looks to me as if our goods in many respects were so good that they are better than the goods of other nations, if we are afraid of having them copied?—It struck me at the Exhibition that our goods were the best, and a number of Americans said so to me, but they added, "Your things are too good; they are too expensive."

301. Does it not come back to my point, therefore, that we may have made our reputation to such an extent in the world in many classes of goods that our people have come to the conclusion that there is no business in advertising those goods in this particular form?—Yes, I think there is a good deal in that.

302. We hear of Germany, or some other nations, spending £300,000 at an international exhibition, but they may for all we know be doing a very foolish thing?—Yes.

303. I mean the industrial success of a country is not to be measured necessarily by the amount that it spends on these exhibitions?—No.

304. I do not know whether you have any information as to whether a considerable number of people who showed at the Paris Exhibition dropped out in the St. Louis Exhibition?—Yes; a great many did.

305. Did you hear any of their reasons for that?—One was that it was too far; another reason that was very commonly given was that the tariff was so high. On this last point it was very hard to arrive at the truth, because, on the other hand, several manufacturers have told me that their trade would be ruined if the American tariff was reduced. They said they did a large trade with America, but they sent nothing but the very best goods, which would stand the tariff, and if the tariff was reduced other people would come in and sell inferior goods and cut them out. There may be

Colonel Sir C. M. Watson, R.E., K.C.M.G., C.B.

16 Nov. 1906.

something in that; there does appear to be a certain amount of soundness in it.

306. Now about the expenses which should be paid by the Government; do you suggest that all the expenses of British exhibits in a foreign exhibition should be paid by the Government?—In the case of the St. Louis Exhibition it was the only chance of getting exhibits at all.

307. Would you pay a man the expenses of the preparation of his exhibit?—No, and that was not done. Really, the position was that the Royal Commission borrowed the articles and showed them.

308. Did they pay for the packing?—No, they did not pay for the packing or for the unpacking.

309. Did they pay for the freight and insurance?—They paid freight, insurance and installation.

310. (*Chairman.*) Not unpacking?—They paid for the unpacking at the Exhibition, but not for the unpacking when the goods arrived home again.

311. (*Mr. Malcolm Ramsay.*) You received the goods packed in the first instance, did you?—Yes.

312. (*Mr. Wilson Fox.*) Did they pay for the space and accommodation at the Exhibition?—No; nobody paid for space.

313. Did not the Government pay for space?—No, nothing was paid for the space.

314. It is a very important matter if manufacturers have to rent their space?—Yes; but as I have said, there was no charge for space at St. Louis.

315. Was it given free by the Americans?—Yes.

316. What was the case at Paris?—At Paris, I think, there was no charge for space; but it is usual, I think, to charge for space.

317. Do you see any objection in the suggestion that the Government should pay all expenses? Would you suggest that where a charge for space is made the Government should pay it, or that the trader should pay the rent, for instance?—I think if you have a collective exhibit you will have to put that in with the other expenses.

318. I only want to get your view on the point?—I think you would have to do so. At St. Louis there was nothing of that sort. They did not, however, provide us with proper floors. They only provided a rough floor over the whole space, and then, when we wanted a better floor we had to lay that down ourselves. Of course, we had to put up everything in the way of screens.

319. Then I come to Sir Swire Smith's point, with regard to the difficulty of selection when you have paid all these expenses. You have a large number of people in the same trade, all competitors and all taxpayers; would they not say, "We have a moral right to send in these circumstances, and you have no right to pick one man out before another, and to give him a free advertisement, and also a gold medal." I cannot see the answer to that if they do, can you?—The difficulty up to the present has been to get them to come, even under such conditions as that.

320. But you are endeavouring now to get them in by paying the whole of their expenses and simply taking their goods out for six months and bringing them back; and if you are trying to get a much larger number of people, do you not think that these free terms will induce a number of people to send?—I can only judge by what we actually proposed when we sent the circular out about the collective exhibits. We sent out to nearly 9,000 people, out of whom the following answers were received:—510 said they would not exhibit at all, 95 said they would exhibit independently, 36 said they would exhibit collectively, and 61 were uncertain. Out of 8,700 we finally only got 60, of whom 35 exhibited collectively and 25 singly. We would have been very glad to have had as many of them as possible.

321. Do you consider that you got a representative exhibit on that occasion?—No.

322. Then, the object of the Commission was not really achieved, if you did not even get a representative exhibit?—We certainly did not get a representative exhibit of manufactures, except, I think, in the chemical industries.

323. I understand that you would prefer not to show at all rather than not get a representative exhibit?—As I say, in the case of St. Louis, we could have done very well if we had left out manufactures altogether, just as we left out machinery.

324. It would be pitiable if at a great industrial exhibition the manufactures of Great Britain were left out of the British exhibit?—It would be unsatisfactory; but still, if you cannot get the manufacturers to come in you cannot help it.

325. Looking at it from the Treasury point of view, if £150,000 has to be paid for side shows and not for British manufactures, that is a strong case against the exhibition, is it not?—I quite see that.

326. Would not most people in this country say the *raison d'être* of a foreign exhibition is the benefit of British trade? If we can make something out of it, indirectly or directly, well and good, but if we are only to show armour and pictures, however interesting they may be, how far is the taxpayer of this country, who is already overburdened, to be asked to contribute towards such objects?—I think that is a fair argument. At St. Louis our principal exhibits, you might say, were in the sections of fine art and applied art. Then the Queen's Jubilee presents were in some ways one of our most important exhibits, because it instructed the Americans about England. Then there was the education exhibit; that did not do trade any good, but it was a very important exhibit. Then there was the transportation exhibit; that, of course, might do a little good, but not very much. Our principal exhibits, you can say, were not in the line of trade.

327. But it is in that line that we must concentrate in the future, if exhibitions are really to be of practical use to us?—It might be better if we did.

328. May I put to you just one point about the suggested central office? Somebody at a central office, with a continuous knowledge of what has gone before, could organise the freight and insurance?—Yes, quite easily.

329. A man who really understood that could get better terms than a fresh secretary coming in, who had to buy his experience for the first time?—Certainly.

330. So there would be an advantage there?—Yes; there would be an unquestionable advantage.

331. He would know where to lay his hand upon packers?—Yes.

332. It is very important in exhibition work, I believe, to get hold of men who can really pack well?—Yes; that is an important point.

333. Then the man we are talking about would probably be able to lay his hand upon the skilled men who had been employed before on an exhibition?—He would keep a register of them.

334. And that would be an advantage?—That would be a great advantage.

335. (*Sir Isidore Spielmann.*) In your *précis* you refer to the fact that you visited various manufacturers, who gave you the answer that they would not participate because trade was good; do you think that if you had called upon them at any other time, perhaps six months before or six months later, when trade was less good, you would have secured some of those manufacturers?—I do not think so, because then they would have said that trade was so bad that they could not afford to exhibit. I am quite sure that would have been the answer.

336. You have referred to the satisfactory exhibit of chemical industries, which was organised by Sir Boverton Redwood and Mr. Salamon; do you think that if the same trouble had been taken, and the same intelligence displayed by other committees, other collective exhibits equally good might have been formed?—If we had had longer time, I think it would have been possible; but the time was rather too short. I think it is more than likely that we would have got others. The one I was most anxious to get was cloth, and I think possibly we might have got a cloth exhibit. There is a very large amount of English cloth sold in America.

337. Then you say that foreign agents do not care to exhibit, because they would have to disclose the names of manufacturers, while the manufacturers cannot exhibit without the permission of their agents. Did you take any steps to induce manufacturers to procure that permission?—Yes. I asked several, and they said they would; but I never heard anything more. I suppose probably the agent would not consent.

338. Then you say, later on, that you would strongly recommend that the British Government should not take part officially in any international exhibition unless sufficient funds were granted to insure a satisfactory result. I believe that you have not spent anything like the grant the Government gave you for St. Louis?—No, we have not spent it all.

339. If you had spent more money, do you think you might have achieved a better result?—It is very difficult, when you are starting a job of this sort, to make an estimate, because you must take care to be on the safe side, for we had the most stringent instructions that we must not exceed the estimate. As a fact, one or two of the exhibits that we had hoped for did not come off, so, of course, we saved money in those directions. Take the case of the chemical exhibit. I had estimated originally that it would cost £12,500, and as a fact it did cost over £12,000, but we got a good return by selling the low-temperature plant, the result of which was to reduce our real expenditure to £10,000; so we saved £2,500 on that item alone. But we must put against that that we estimated the art exhibit at £12,000, and it cost us £14,600; you know the reasons for the increase. It is, therefore, exceedingly difficult beforehand to make an estimate which you will stand to exactly, and no more.

340. Reference has been made to your expenditure for entertaining. Were you not allowed a grant for entertaining, and requested not to exceed that amount?—The grant that was given us was £2,000, but we did not come near it; we only spent £1,346.

341. You had 36 Commissioners on the St. Louis Exhibition?—Yes.

342. Can you tell us how many of these Commissioners were working Commissioners?—I think the majority of them were. There were only a few who did not work, and the majority helped very much. Mr. Webb, of the London and North-Western Railway, for instance, was very ill all the time, so, of course, he could do nothing; and there were one or two others. Several of the 36 were also Art Commissioners, and you know they always came to the Committees.

343. What is your opinion on abolishing awards at these exhibitions?—I think it would be totally impossible. I do not think anyone would go at all if there were no awards. They set great store by them; in fact, it often seems to me that they set more store by them than they are worth. We have had an immense amount of correspondence with exhibitors who tried to get higher awards. A man gets a gold medal, and he is never satisfied unless it is turned into a *grand prix*, and he cannot understand why I cannot turn it into a *grand prix* for him. I used to have to tell them over and over again that really I was not the jury. They were tremendously keen about the awards.

344. (*Mr. Harris.*) As regards the assignment of awards, did the jurors assign direct to the individual manufacturer in the case of a collective exhibit, or did they simply grant an award to the exhibit, and leave the Committee to assign the award?—The jurors examined each exhibit in the collective exhibit, and assigned the award.

345. To the individual?—To the individual. The other way would have been very unsatisfactory.

346. (*Mr. Waring.*) You mentioned that the chief reasons given by manufacturers and firms for not exhibiting were the high tariff, "too much trouble," and "exhibitions do no good"?—Yes.

347. Were there not other reasons given for not exhibiting, particularly at St. Louis?—One or two said they did not wish to exhibit in America.

348. Were there not other reasons given?—I do not remember any other reason.

349. From the individual standpoint, was not the reason urged that the expense was enormous to go to St. Louis?—Yes, on account of the distance.

350. The cost was enormous?—Yes. It was higher than going to Paris, for instance. But I did not hear that that was often given as a reason.

351. Did you not hear it given as a reason by those who would have gone that the great point which deterred them was that the cost was out of all proportion to any possible gain?—I think I did hear that once or twice, but it was not made what you might call the ordinary reason. I should think the most ordinary reason I got was that they were too busy. Of course, there were other reasons. For instance, one manufacturer told me he did not wish to exhibit in an uncivilised country.

Colonel Sir C. M. Watson, R.E., K.C.M.G., C.B.

16 Nov. 1906.

352. That is another point. Was it not an important factor that St. Louis was not so highly civilised, or the surroundings were not of such a character as to make it worth the while of a great number of manufacturers to exhibit?—I dare say that had something to do with it. They may have thought there would not be so many people coming to the exhibition.

353. And that there would not be a demand for their class of goods?—Yes.

354. There was not that high degree of civilisation in that particular neighbourhood so far west as to make it worth their while going over?—I dare say that had something to say to it.

355. Have you heard expressions of opinion from manufacturers as to whether they considered the St. Louis Exhibition was a failure or not?—I have heard very little expression of opinion. I have heard some very favourable expressions of opinion. One gentleman—I do not know whether the Committee will examine him, the Mr. Baker to whom I alluded before—expressed a favourable opinion of the exhibition and of the results to his firm.

356. From a business standpoint?—Yes; but I expect there are varying opinions upon it.

357. You are not quite clear?—I am not at all clear, and I could not undertake to give an opinion on the subject.

358. You seem to attach great importance to the social aspect of an exhibition?—It is a very essential part of it.

359. And you attach great importance to that?—Yes.

360. Out of the £150,000 that we spent at the St. Louis, or that was granted for the St. Louis Exhibition, have you any idea what was the cost of, say, the buildings as compared with the salaries?—It is all specified in the accounts attached to the Report.

361. Roughly, do you know what is the proportion of what one would call the social parts—that is, the travelling and the entertaining—to the cost of the buildings?—The travelling expenses were connected with the exhibits. As a fact, the collective exhibits cost £48,122, as against a total of £121,000; but to that you ought to add the cost of the installation. Indeed, there are a number of other items that really ought to be added, such as the installation, the storage of empty cases (which is a heavy item), the catalogues, and the jurors.

362. That would go into the £120,000?—These items are included in the £120,000.

363. But you have £48,000 for the exhibits?—Yes.

364. That would leave £72,000; what would that amount be spent on chiefly?—A large item was installation and decoration, including the erection of façades.

365. How much was that?—£5,800.

366. That would make it £53,000?—Yes.

367. Then practically more than half of the money voted to St. Louis was spent on matters of an ornamental nature?—No, not half.

368. Over half?—No; because you have to include the salaries. They were for the exhibits, too.

369. What is the real value, from the practical standpoint, of the Commissioners' building?—Every country ought to have a building for its headquarters.

370. But there is a great expenditure for it?—Yes.

371. Assuming that the expenditure is justified—I am asking this for the purpose of getting information for the future—what is the real value of that building from a practical standpoint?—I do not know that from a financial standpoint you can say it is of any value, except that it saved the cost of offices, but it is a very necessary feature of an exhibition.

372. (*Chairman.*) You said, I think, just now that we could not be represented without it?—We could not be represented without it; that is the point. If we had not had a pavilion, and had not entertained, it would have been much better for us not to have been there at all.

Colonel Sir C. M. Watson, R.E., K.C.M.G., C.B.

16 Nov. 1906.

373. (*Mr. Waring.*) I am afraid I am not quite clear on that point, and that I still do not quite appreciate what the value of the entertaining is. What would you term the value of the entertaining and the ornamental part of it? Is it a political good?—I should think it is more political than anything else, as far as I know, but really I have never considered the question. I was told I had to go and do as well as I could, and that is an essential part of the work.

374. Would it come under your function at the exhibition, or would it come under anybody's particular instructions, to compare the relative merits of the English or any section of the English exhibition with those of the German sections or the American sections?—We were all judged by the same jurors.

375. I mean for the purposes of information and for instruction in the future, or for securing some specific value to the nation?—No; I do not think anyone would do that.

376. Nobody said, "We are pretty well ahead in this kind, and we are behind in that"?—The best written opinions on that subject are in the jurors' reports, which are all in the Report, because they went very fully into that very question.

377. Comparatively?—Comparatively. Most of the jurors, after reporting on the British exhibits, also reported shortly on each of the foreign exhibits, and showed where they were ahead of us and where we were ahead of them. Those jurors' reports are very well worth reading. Here, for instance, is Mr. Redgrave's report on ceramics, which appears on the first page I open. He says: "My general conclusions upon the ceramic displays at the St. Louis Exposition lead me to believe that more novelty and originality are to be found in the works of foreign countries than in those contributed to the British section, and that in countries where State schools making a special study of ceramic processes have been founded—as, for instance, in Germany and Austria—a great influence for good upon the manufactures and many original features in design and workmanship can be traced." That is a very useful and helpful remark, and there are many of those all through the jurors' reports.

378. Might not an exhibition be made very beneficial by one ascertaining what the particular requirements of a country are, as shown by its own exhibits?—Yes.

379. Some real, practical good might be obtained in that way?—Provided you can get the manufacturers to exhibit; but that seems, up to the present, to be the great difficulty.

380. One is, perhaps, speaking somewhat personally in this matter, but I should imagine a great factor in that was the cost?—I think it is very likely.

381. I am rather under the impression, as regards this particular exhibition that you were associated with, that the cost was a tremendous factor?—It was.

382. The cost was abnormally high compared with any results that might be obtained?—Yes, of course, American railway freights are high, although they made a reduction, and gave us half fares each way.

383. Had you any particular point in your mind when you became associated with that exhibition as the real object to be aimed at in an exhibition—that is, whether the object was to bring manufacturers together from various countries, or whether exhibitions should be promoted more from the political and social standpoint?—No; I had not considered that before.

384. Have you formed any conclusion since?—My conclusion rather is—I say it with great hesitation—that I do not know that it does the manufacturers much good, but that at the same time I think it would be very hard for the country on certain occasions to keep out of an exhibition, politically speaking.

385. But, from the business standpoint, you practically have not studied it very much?—No, I have not.

386. So there is not much point in pursuing that further. Did you give any particular attention to Germany, except in a casual way? Were you impressed with the German exhibits?—I thought the German exhibit was very good, but the exhibit which impressed me most of all, I would say, was the Japanese exhibit.

387. Would you say Germany and Japan?—Yes; but I think in some ways Japan was better than Germany.

388. Was the point that impressed you in the German exhibit the individual nature of the exhibit or the manner in which it was presented? Was it presented in a better way?—Both exhibits were collective. Practically, the Germans worked on the collective system, and so did the Japanese.

389. Was it the collective system that impressed you, or was it the individual exhibits?—I think it was more the excellent way in which they were arranged collectively.

390. That is because they were largely helped by the Government?—Yes.

Sir ISIDORE SPIELMANN, a Member of the Committee, examined.

Sir I. Spielmann.

391. (*Chairman.*) You are a Member of this Committee, and you acted as Honorary Assistant Secretary of the Royal Commission for the St. Louis Exhibition?—Yes.

392. You were also Honorary Secretary of the Fine Art Section of the British Commission for the Brussels Exhibition of 1897?—Yes.

393. You were also Director of the Fine Art Section of the Royal Commission for the Paris Exhibition of 1900, and Honorary Secretary of the Art Committee of the Royal Commission of the St. Louis Exhibition of 1904?—Yes.

394. And you are Director for Art in connection with the British Government exhibit at the present New Zealand International Exhibition?—Yes.

395. What is your opinion about the effect of international exhibitions upon manufactures and art in this country?—I think they are stimulating as regards both arts and manufactures.

396. As I understand, you think that those who have participated intelligently in international exhibitions must have benefited, directly or indirectly?—I do. I refer particularly to those who take the trouble to exhibit properly—those, for instance, who send attractive show-cases with well-arranged exhibits, and a representative who knows his business, and who usually secures orders or important awards—a man who can explain exhibits thoroughly to the British juror, and also to the international jury when it comes round. On the other hand, as a contrast, numerous exhibitors send on their own account extremely ugly show-cases, with exhibits arranged in a most inartistic manner, whose representatives perhaps are rarely in attendance, even when the British jurors want information, and are incapable of acting for their firms in the way they should.

397. Going back to the first class, you say they must have benefited. Have you reason to know that they have had good orders in their particular classes?—I have reason to know that a great many have, but among those who have benefited many have taken high awards, either gold medals or *grands prix*.

398. Do you think those have helped them in their business subsequently?—I do. I think they have been most important to them.

399. Then we come to the question of copying the goods exhibited. Do you think there is much in that fear which is entertained by many in this country?—I think it is very much exaggerated, and I also think that if other people copy British goods, British exhibitors can, and very often do, copy the foreign goods they see there—sometimes to our advantage.

400. Coming to the commercial results, do you think those have been sufficient to warrant public expenditure?—Not if the existing methods continue. I think we exhibit under a disadvantage.

401. Would private enterprise have done better?—I do not think so.

402. On what conditions, as regards other countries, should we make grants? For instance, have we been treated as well as other countries in regard to space,

and so on?—No. Speaking from experience, I know that Great Britain has often had an inadequate amount of space in various sections, and very often that space has been in very unsuitable positions.

403. Has that been accidental? It has not been on purpose, has it?—I cannot say that it has not been on purpose.

404. Do you suspect it has been on purpose?—I can give you a case in point. At the St. Louis Exhibition the British Art Section had a less good place than either Germany or France, much less good. Perhaps the amount was adequate, but its situation was extremely bad. It could only be approached through the sections allotted to Germany and Holland, and we had great difficulty in having an additional approach made to it, and that was only done weeks after the exhibition opened.

405. Can you tell us the usual way in which the British section has been worked?—In Great Britain we are usually in the hands of Royal Commissions, or sometimes of the London Chamber of Commerce, and the delay that is occasioned by our methods usually compels us to start at a very late date, and so we have to rush the preparation of our exhibits.

406. Have you any opinion about the present system, which allows a free hand to the exhibitors?—When they participate on their own account they are allowed to do pretty well what they like—to send what they like, and in show-cases of any size or shape or description, the whole thing being a very inharmonious display.

407. Have you come across any instances of manufacturers being not allowed by their agents to exhibit?—I have not.

408. As regards the methods in Germany and France, do you know the German method?—The German method is an organisation under the German Minister of Commerce, who has a trained staff of assistants. When they participate in an exhibition, the Minister, who takes a personal interest in the work, does not invite exhibits, but he actually requests them—he almost orders them—from the various firms, and he forms his "collective" exhibit in that way.

409. He has no power to compel them, has he?—He has, perhaps, no power to compel them to participate, but I think his requests are very strong inducements.

410. Does he have a sort of competitive examination then, in the best things?—I believe they have; and it is well known that the Emperor himself takes a special interest in the selection; in Art, for instance.

411. Did you ever hear that in Berlin, in 1897, they were already preparing for the Paris Exhibition of 1900 by a sort of competition under Government auspices?—Yes, I did hear that.

412. The expenses are all paid by the Government in Germany, are they not?—They are.

413. And all the trouble is taken out of the exhibitors' hands?—Yes, all the trouble is taken off their hands. May I say one more word about the German method of exhibiting? They now seem to make it a rule to participate very largely and at great expense in pretty well every international exhibition. Even at Liège, where this country did not participate officially, Germany had a very large and a very important exhibit. At Milan, I am told, they again had a very important exhibit, and at every exhibition, even of minor importance, they participate. It is not uninteresting either to note this fact—that, although Germany participates in every international exhibition she can, she never has one in her own country. It is curious to note that they have not had an international exhibition since 1870, 36 years ago. I think the correct inference is this—that she is interested only in showing her manufactures and in advertising them in foreign countries, but is less anxious to show foreign manufactures at home to her own population.

414. Now what is the system with regard to France?—In France exhibitors who desire to participate do so through the *Société Francaise des Expositions a l'Etranger*, which is a society composed of a large number of exhibitors—over 2,200. They contribute annually to the Society, and when there is an international exhibition the Society does all the work for its members, and the Government makes a grant on each occasion, the Government recognising the Society.

415. Do you mean by "recognising" it that the Government subsidises it?—Yes.

416. It is one of those societies which, under the French law, are regarded as a public utility, just as many other societies are?—Yes. The same thing applies to the fine arts section; but that particular Society has nothing to do with the fine arts section, which is worked by the Ministry of Public Instruction and Fine Arts. The permanent Office for that department is always kept going whether there is an international exhibition on or not, and at a cost, I think, to the Ministry of Education, of about £600 a year. It is regarded as a permanent department.

417. That is for the art sections?—Yes.

418. In your experience do they show well under art?—They do. They have their difficulties owing to the existence of rival societies, but their Art displays are invariably good.

419. They did not show as well as we did at St. Louis, did they?—No. I may say that at Brussels (1897), Paris (1900), and St. Louis (1904), Great Britain has by common consent taken the first place in the art section.

420. Other British sections have not done so well, have they?—They have not; and I think the situation has frequently been saved by the art section.

421. To what do you ascribe the comparative failure of the other British sections?—In my opinion it is due to the method of exhibiting individually and not collectively.

422. Do you think that collective exhibits could be worked here satisfactorily?—If the same amount of time and trouble were taken with various trades that is always taken in the art section; or with the chemical section at St. Louis, of which we have heard so much this afternoon, I think equally good displays might be made.

423. I think you know of some recommendations in regard to that which appear in the Report of the Royal Commission on the Paris Exhibition?—Yes. There is a very strong recommendation in that Report, which runs from the bottom of page 32 to the bottom of page 36. (See Appendix, No. I., p. 312.) It is signed by 118 members of the Royal Commission.

424. I understand you attach great importance to this newer system of collective exhibits?—I do.

425. And, if we do not have these improvements, you would sooner that we abstain from exhibiting?—Much rather.

426. What modification of the German system would you apply to the organisation of our British sections?—The modification I refer to would be by the addition of experts to help a permanent department, and selected chairmen of Chambers of Commerce should be induced to co-operate. I do not think that a permanent department should pay all the expenses of exhibitors. They might pay the cost of transport, space, and insurance, and leave to the exhibitor the cost of packing, and of his representative at the Exhibition.

427. Would you give to the permanent department and their expert advisers the right to say "You shall," or "You shall not exhibit such and such goods"; would you let them choose what should be exhibited?—I think that ought to be done.

428. Do you think that our manufacturers would stand that?—I think, if properly explained to them, they would see the advantage of exhibiting the special things required.

429. Do you agree with the last witness in wanting a small permanent department?—I think that would be most useful.

430. Do you think that we should save time in beginning the work when there was an exhibition?—I do. In my experience, as I have said before, we are in the habit of starting so late that there is always a rush to make up for lost time, and very often the time cannot be made up.

431. Would you form your committee of experts each time? You would not keep a permanent committee of experts, would you?—I think I would keep a permanent committee attached, but not necessarily employed.

432. (*Mr. Wilson Fox.*) It would have to be rather a large committee, would it not, if you are going to have on the committee men who know something about

Sir I. Spielmann.

16 Nov. 1906.

all British trades?—I do not mean a committee of that size. I think the chairmen of the leading chambers of commerce, who need not be numerous, might be part of that committee; otherwise there are not so many exhibition experts.

433. (*Chairman.*) Do you think that the chairmen of the leading chambers of commerce would represent the various industries?—Yes.

434. Of course you recognise that there are many towns where there are a good many industries, and that very often industries cut across and extend over several towns?—Yes. The committee would have to be carefully selected, and it would be worth while taking a great deal of trouble to associate the right men with a department of this sort.

435. Do you think you could find somebody who would know all the manufacturers in his own special branch?—I do.

436. You do not think there would be a great difficulty with that?—I think there would be difficulty, but it would be worth while trying. I think they would be found, and I also think they would be found willing to act.

437. To act as chairman of each collective exhibit?—To undertake the formation of a special collective exhibit of a special industry. Each of these gentlemen might be made responsible for securing a successful display in his own particular branch of industry.

438. He would act as a juror, I suppose?—Later on he would also have to act as a juror for this country on the international jury, the advantage being that he would be familiar, not only with all the exhibitors, but also with their exhibits. It is no uncommon thing now at international exhibitions for jurors to be brought in to act at the last moment. It has happened to me. I was asked to act at the Paris Exhibition as juror for fired decoration about one week before I had to act. That was a very short time in which to make myself familiar with the exhibits and to make the acquaintance of the exhibitors. If the system I suggest were adopted, the chairman of a Chamber of Commerce, who has formed the collective exhibit would be already thoroughly acquainted with all the separate exhibits, and he could press their merits upon the international jury much better than a late-comer would.

439. Is it not very difficult to get people of eminence in this country to give up so much time?—No. If they have adequate notice, jurors, as a rule, are willing to act. A great deal depends upon the distance. It was difficult to obtain jurors to go over to the St. Louis Exhibition, but it was very easy to find jurors for Paris.

440. The greatest difficulty in your scheme appears to me to be the getting of these chairmen of all the different sections who will afterwards act as jurors. It sounds like giving up a great deal of time on the part of very busy and important men?—Many of the Commissioners who now act also give up a great deal of time, and do so willingly.

441. (*Mr. Wilson Fox.*) On the question of space, which you will no doubt agree is an extremely important one, because the whole result of our exhibit might depend upon it, how is that arranged at the present time? Is it first come, first served, or how?—Take the case of the Paris Exhibition in 1900. The space that was allotted or offered to Great Britain was thought by the Foreign Office to be altogether inadequate, and Lord Salisbury made strong representations through the Foreign Office on the subject, and after a good deal of trouble we had additional space allotted to us.

442. Does the foreign country which holds the exhibition map out certain spaces, and then make the offer to the other countries, without those countries being heard in any way, or does it make an offer of space after a certain time has elapsed and a certain number of applications have been received from various countries?—They make the offer of space after they know that the country will participate. Unfortunately, they hear from Great Britain long after they have heard from other countries.

443. They wait to allot until they have heard from the respective countries?—They do.

444. Therefore it is, to some extent, a case of first come, first served?—Yes.

445. Do you say that Great Britain is late in the field, as a rule?—I do; very late. In addition to what I have said in reply to your previous question, I should like to add that, although they sometimes nominally allocate to Great Britain certain spaces in various sections, these are not always allotted, because the representatives of other countries are first in the field. They visit the exhibition at once, and often induce the exhibition authorities to give them space originally intended for us.

446. Because we have taken no steps?—Yes.

447. If we had some sort of permanent establishment here, however small it might be, that establishment could look after our interests in that respect, I presume?—I most certainly think so.

448. In asking for space to be ear-marked, I assume the country that does that has to be certain that it has a sufficient amount of money at its back to fill that particular space with exhibits?—They are not obliged to take it all up if they cannot fill it.

449. How long have they the option, as a rule, do you think, because I presume it would be very inconvenient for the country in which the exhibition is being held to have space in certain spots thrown back on their hands at different times?—The option would extend for a reasonable time; but they can always fill unallotted space themselves.

450. Do you think that because we have not had a proper amount of space or a proper position in recent exhibitions that has operated against British manufacturers and traders showing?—I think a great many have been very disappointed with the space allotted to them.

451. In the third paragraph of your *précis* you say: "I am of opinion that those who have participated intelligently in international exhibitions must have benefited, either directly or indirectly." What do you mean by participating intelligently?—As I explained to the Chairman, I mean that if they will take the trouble to be represented thoroughly, by sending an attractive exhibit and by sending a capable man to look after their interests they will benefit; but if they do not take that trouble, they will probably get nothing out of it.

452. Do they all send a man with their exhibit, or do two or three people join together, because probably the most expensive thing to an exhibitor connected with an exhibition is the sending of a man, say, to St. Louis?—An important firm will usually send its own representative, but there are exhibitors' agents, who will perhaps represent 20 or 30 firms.

453. Now, about the awards. I heard Sir Charles Watson say that the proportion of awards to exhibits is very large, and I should like to know whether those awards really are given on merit, or whether practically everybody who sends has an award—in plain English, what really is the value of those awards?—Different exhibitions have different methods of dealing with awards. At some exhibitions they allow every exhibitor to be eligible for an award, unless his exhibit is absolutely bad. At other exhibitions they decide that they will apportion a given number of awards only, and then the competition for them is very great.

454. I can conceive that a very generous system of awards would stop first-class men from exhibiting at all, because, if a first-class man is given an award, and at the same time a similar award is given to a fourth-class man, simply because he also has shown, I can conceive that that would operate against first-class firms showing?—They give only a small number of *grands prix* or gold medals, which are the chief awards that the firms compete for.

455. (*Chairman.*) People do not care much about the copper and silver medals, I presume?—No. If a large number of awards are given they are chiefly silver and bronze medals.

456. (*Mr. Wilson Fox.*) Do you take the view that a too generous distribution of awards might operate against the best men competing?—I do not think so, because their aim is always the *grand prix*.

457. That is their incentive?—Yes.

458. I only want to bring that out in order to ascertain whether the value of the award is really of any moment?—Of course, there are certain exhibitors who withhold their exhibits from competition, and who send them *hors concours*, but the majority compete keenly for *grands prix* and gold medals.

459. I take it that an art exhibit is on a different footing to a commercial exhibit?—It is.

460. An artist has no particular brand of picture; he cannot get a reputation for a brand of picture, and each picture stands on its own merits?—Yes.

461. Therefore, I take it that you must have a collective show of pictures, and you cannot send a sample of a particular artist's work in the same way that you can send a sample of mustard, say?—Art is always a collective exhibit.

462. Therefore, if it is always a collective exhibit, you must have somebody to organise it?—Yes.

463. That is necessary in order to make the proper selection of artists from an artistic point of view?—Yes.

464. I suppose the element of awards does not come into art in the same way?—I think it does.

465. Have you come to any conclusion yourself as to the benefit, apart from political reasons, which accrued to Great Britain from such an exhibition as the St. Louis Exhibition?—Yes. I think the very fair proportion of high awards allotted to British exhibitors was satisfactory.

466. Of awards, yes, but then we want to carry it further than awards. Do you think that orders are given afterwards to British exhibitors?—That is very difficult to answer. The orders are not always booked at the time. They very often come afterwards as the result of the firms having put in an appearance.

467. You are in favour, I understand, of the names of the exhibitors being given with the exhibit?—Yes.

468. You do not agree with Sir Herbert Jekyll, who took the contrary view the other day?—No, I do not. I think it is essential that the exhibitors' names should be given.

469. The point has been raised that some traders do not show, on account of the agency system of selling goods abroad. That does not obtain in a large number of trades, does it?—It only obtains in certain trades, such as the textile trades, I think.

470. There is a demand and a large demand, on the Continent and elsewhere abroad for the goods of particular manufacturers?—Yes, there is.

471. I am thinking of well-known manufacturers whose names I need not mention; their goods are asked for, and are well-known abroad?—Yes.

472. Therefore it is only in certain classes of trades, the textile trade is one, that the names of manufacturers are unknown?—Possibly. If steps were taken to induce the manfacturers to exhibit, or to obtain permission from the agents for their manufacturers to exhibit, I think they would do so; but the effort has never been made to my knowledge.

473. That is what my next question was going to be—this system of collective exhibits was only tried at the last international exhibition, was it not?—That is so. At the Paris Exhibition there were only two collective exhibits—the worsted manufacturers of Bradford and the Redditch Needle Manufacturing Company. The system was tried on a larger scale at the St. Louis Exhibition with a certain amount of success, and I am of opinion that if trouble were taken in other directions it would meet with still greater success.

474. I take it you are not disposed, having regard to the St. Louis experience, to say that, without further trial, the system has failed?—No, I think an extended trial ought to be made.

475. Sir Charles Watson showed us that a very small proportion of the British catalogue was devoted to manufacturing exhibits, and in view of that it might be argued that the manufacturing portion of the British exhibit was a failure?—Quite so.

476. But you would not say on the St. Louis precedent that a sufficiently fair trial has been given to the collective system to warrant people coming to the conclusion that the collective system of showing goods at a foreign exhibition is a failure?—No. I think that the issue of thousands of circulars inviting firms to participate in a collective exhibit is merely a waste of time, because they do not quite know what collective exhibits are. If they have not had the system fully explained to them, and if they have not been shown the advantages of it, favourable answers can hardly be reasonably expected.

477. Do you think that if you sent a persuasive gentleman round to the Chambers of Commerce, who held meetings and gave explanations to them, that would be a good system?—I do. Whereas I do not think they are disposed to attend to circulars from a Secretary of a Commission inviting them to participate, I think they would listen seriously to an invitation emanating from a permanent department or a Government Department after an explanation of the system.

Sir I. Spielmann. 16 Nov. 1907.

478. And what other countries are doing?—Yes.

479. Such steps as those, which have not yet been taken, you think are worth a trial?—I do.

480. (*Sir Swire Smith.*) I think you have made it very clear in your evidence that the Art Sections in the exhibitions to which you have referred, have been successful very largely because of the collective display?—Yes.

481. The method by which those pictures were selected seems to me to be one of immense importance, and I assume that there would be a committee of experts, who would select the pictures and would make sure that there was no rubbish accepted. If a similar method were adopted with regard to the manufactures, and if every department of industry were represented among the jurors by experts, would you be of opinion that a result equally satisfactory to that which you have obtained in art would be obtained in manufactures?—Yes, I think it would be equally satisfactory.

482. The formation of such a committee to make the selection would be your main point in securing the best possible exhibits of manufacturers?—Yes, I may tell you briefly that in the case of the Art Section a carefully selected committee not only frames the list of the exhibitors to be invited to contribute works of art, but actually selects the works of art.

483. And that, you think, is just as necessary with regard to manufactures?—Yes, if you wish to score a success.

484. Is it your opinion that the general reputation of this country has been very much advanced in other countries with regard to art and artistic productions by the exhibitions of art, which we have seen from time to time?—Yes, I do think so.

485. And that the only way of thoroughly restoring our reputation with regard to manufactures is to adopt a similar course there?—Yes.

486. (*Mr. Malcolm Ramsay.*) You were speaking about the failure of British firms, owing to the bad or indifferent agents that they employed; did all the exhibitors in the collective exhibits at St. Louis employ their own agents?—Some did; others were represented by Mr. Arthur Day, the Exhibitors' agent.

487. Did they have to pay for his services?—Yes.

488. I understood from Sir Charles Watson's evidence that the manufacturers paid nothing once the goods had left their doors in this country, but it seems that they did have to pay something, viz., either the whole or a part of a man's salary out there to represent them?—Yes.

489. In your *précis* you say you do not think that better results could have been obtained by private enterprise; are you referring there to results from the general point of view, or to the particular results which may have been obtained by individual traders?—I was referring to both. I then had in my mind the case of the Liège Exhibition, where I think no particular advantage has accrued to this country—rather the reverse—by its being thought that Great Britain had participated officially, whereas the British Section was promoted by private enterprise, and a rather poor show was the result.

490. You were also thinking of the individual point of view; namely, that the trader who wanted to advertise his goods got a better result out of joining in the exhibition than he would have obtained by pursuing his own methods and employing his own traveller?—Yes.

491. Is it the case that in Germany all the expenses of the preliminary local competitions are paid by the Government, or are they paid locally?—I am afraid I cannot answer that question definitely. I think that those who are accepted have their expenses paid for them, and that those who are rejected have to pay their own expenses.

Sir I. Spielmann.

16 Nov. 1906.

492. In any case, I presume the expenses would not be very great?—No, they would not.

493. As regards the French method; do I understand rightly that the firms that join the *Société Francaise des Expositions à l'Etranger* subscribe, and that the Government only pays, therefore, part of the expenses of individual firms?—Their subscription is only a nominal thing, I think. They pay for their space, but the Government makes a grant independently to pay for the decoration of the section and for other expenses, entertaining being one of them.

494. Then the Government grant to the Society is a very substantial one?—It is a substantial one. Their beautiful show cases and all the things necessary to equip their sections are transferred from one exhibition to another, and are very costly and very artistic.

495. You are of opinion that the method of collective exhibits might be a success in future if trouble were taken. Do you mean if trouble were taken by the organising committees, or if it were taken by the traders?—I mean if trouble were taken either by the Commission or by the organising committees. I do not think that hitherto a sufficient amount of trouble has been taken to persuade manufacturers to exhibit collectively.

496. I suppose you would say that the manufacturers on their side had not taken particular trouble to appreciate the method?—That is so. I even think that circulars received by secretaries of Chambers of Commerce would probably be thrown on one side. It would only add to a secretary's work if his chamber took up the matter at all; and, as I have said before, I think the efforts to obtain the co-operation of Chambers of Commerce have hitherto been very slight.

497. With regard to the financial aspect, do you share the view that Sir Charles Watson expressed, namely, that unless we go in largely it is better not to participate at all?—Yes, I quite agree with him there.

498. Looking, for instance, at the list of grants that we have given, do you think that it would have been better not to have given anything for the exhibitions at Milan and Christchurch this year, and not to have participated in them?—I should not put New Zealand in the same category as Milan.

499. Of course it is not in the same category as Milan?—I hear that even at Milan out of its slender grant there is a surplus. Going back ten years, the Committee of the London Chamber of Commerce was asked by the Foreign Office to undertake the exhibit at Brussels, and they were given £4,000; they also raised a guarantee fund which amounted to about £6,000, but the guarantors were not called upon. The space was sold, and even out of the grant of £4,000 they handed back something to the Government—about £1,000, I believe.

500. It was about £700, was it not?—It was, I think, over £800. In that Art was not included. I remember we had to approach the Chancellor of the Exchequer separately, and he gave us a grant of £1,500.

501. That was a supplementary grant?—Yes. We had £300 in addition from the London Chamber of Commerce, and Sir Edward Poynter and I had to find the balance. But it was a most satisfactory exhibit.

502. Could you tell me whether in your opinion the Government grants that have been given in the past have been spent to the best advantage?—I think that the expenditure is open to a great deal of criticism. In the first place, I think that we have spent too much on our pavilions as compared with those of other nations. We are in the habit of building solid structures, capable of lasting for years, whereas other countries merely erect pavilions to last a couple of years, not more. What I am now saying of Paris and St. Louis holds good also for Chicago and Philadelphia, where the cost of the pavilions made very large holes indeed in the total amount of the grant. At Paris the grant was £125,000, and nearly £30,000 of that amount was eventually returned to the Treasury, consequently they spent just under £96,000, and of that amount about £23,000 was spent upon the pavilion, leaving only £73,000 for all other expenditure. At the end of the six months, when the pavilion was no longer needed, it was sold for about £200. It was a steel structure, splendidly built, unnecessarily substantial, in my opinion, and the contractors took it back at a cost of £200. It is true that no charge was made for removing it. As an asset it merely figured in the accounts for £200. At the St. Louis Exhibition the pavilion and its garden together cost close upon £32,000. The grant was £150,000, and I have no doubt that a substantial sum, when the Commission is wound up, will be returned to the Treasury; but assuming that the Royal Commission for the St. Louis Exhibition spend £125,000, the pavilion costing £36,000, that leaves £89,000 for other expenses, all told.

503. (*Mr. Wilson Fox.*) Have you got any figures showing what foreign nations spend upon their pavilions?—I cannot tell you officially. At the St. Louis Exhibition Germany spent on their pavilion, which was a copy of the Palace at Charlottenburg, a rather substantial sum, though I do not think it ran into anything like the amount that we spent—£32,000. With that exception, all the other pavilions, I should say, did not cost anything like half of the amount that we are accustomed to spend on our pavilions. Arising out of that, I would like to say that if Great Britain erected pavilions of a less substantial nature which would answer the purpose, they would have a very large saving under that head. If that saving, and the surplus which it seems to be the custom to hand back to the Treasury, were added together and spent on collective exhibits (which are all important), a vast amount of good might be done for manufacturers, without any additional financial burden whatever being placed upon the Government. It would then be unnecessary to go to the Government for larger grants than £150,000.

504. I do not quite understand about the pavilions. Is the pavilion the place where the British exhibits are shown?—No; it is the headquarters of the Commission, as it were.

505. Is it purely used for entertaining?—No, but entertaining also takes place there.

506. (*Mr. Malcolm Ramsay.*) The offices are there too, are they not?—Yes.

507. (*Chairman.*) It is also a sort of advertisement of the country generally, is it not?—Yes.

508. At Paris was it not an old manor house?—At Paris it was a copy of an old Jacobean house, and it was a most attractive feature in the Exhibition. It was beautifully decorated inside, three rooms being the exhibits of separate firms. A number of pictures by old masters were hung in the rooms, so that altogether it was a most attractive place. In referring to these pavilions as being in my opinion unnecessarily expensive, I refer really to the building only, because the decoration and the furnishing of the rooms are usually exhibits.

509. (*Mr. Malcolm Ramsay.*) Do I rightly understand your view to be that, under improved organisation, and particularly with a system of collective exhibits, a grant of some £150,000 would be sufficient for a first-class exhibition?—I am of that opinion.

510. You would not like to be committed to that figure, perhaps, but you think it would come to something like that?—I think £150,000, properly spent, should do all that is necessary at a very large exhibition.

511. If the Government were not forced by reasons of policy into joining in large international exhibitions, and wished to spend money merely for the advancement of trade, do you think that participation in exhibitions would be the best way of securing their end?—Yes, I do.

512. Have you made any estimate of what the permanent nucleus, I mean the permanent office, would cost?—No, I have not, but I know that a similar department in Paris for the art display incurs an expenditure of £600 a year. That is somewhat increased when an exhibition is in active progress or has to be promoted.

513. (*Chairman.*) But it would not be quite the same thing, would it? You would want something more expensive, would you not, for general industries?—Yes; but taking that as the cost of the art section at Paris, I would assume that it would not cost much more for industrial purposes.

514. (*Mr. Harris.*) Do you not think that one effect of a permanent department would be to produce a desire to participate in exhibitions, without any reference to the advantage to trade, but simply as exhibi-

tions?—It might; but the department might be used for other purposes, and the staff, however modest, might be otherwise employed when no exhibition is in progress.

515. And that would get rid of the idea that they simply existed to find out and create exhibitions?—I think it would. It is not generally known that it takes quite as long to promote an exhibition as it takes the exhibition to run; and it takes quite as long, or longer, to wind it up; so that, as a matter of fact, the interval between the closing of one exhibition and the opening of another in all probability would not be very great.

516. I understand that you have expressed an opinion that British industrial sections were usually more like a bazaar than an organised and artistic exhibition; do you not think, from the point of view of trade, that a bazaar after all is the more attractive?—It may be so, but when I made that remark I had the inartistic effect of the British section in my mind.

517. The trader does not look at the artistic effect necessarily, does he?—The British industrial sections at the Brussels Exhibition and at the Paris Exhibition were most inartistic. There were all sorts and sizes of show cases, and there was no decorative effect whatever surrounding them. Taking them in comparison with the French and the German sections, they really looked like second-rate bazaars.

518. With the result, do you think, that people rather passed it on one side?—I think so. I think people were attracted by the more artistic sections of other countries.

519. You have been to a great many exhibitions, and you heard what Sir Charles Watson said about distance; have you formed any opinion of the effect of distance on the mind of exhibitors or would-be exhibitors?—As regards the industrial sections, I have no doubt that what Sir Charles Watson said is correct. I think that exhibitors do object to sending very great distances, such as to St. Louis. As regards New Zealand, I have not heard an adverse remark about the distance.

520. (*Mr. Algernon Law.*) How are the awards apportioned as regards countries, by the number of exhibits, or is there a certain amount of scrambling amongst the various commissions to obtain a large amount of awards for their own countries?—There is a scramble for awards. Speaking as a juror, I may say that I have found other jurors fighting for their countries more than for the merit of the exhibits. I tried to get as many medals as I possibly could for England, apart from the merit of the exhibits I had to judge.

521. (*Chairman.*) Has not your brother also had a similar experience?—I think so, in the art section.

522. (*Mr. Algernon Law.*) Do you think that exhibits of manufactures are more difficult to organise than those of art, which are usually compact, and therefore it is more easy to get art exhibits than exhibits of large machinery, and so forth?—It is occasionally difficult to get the things one requires in the Art Section.

523. In the case of St. Louis probably time had something to do with it, and a manufacturer might have said, "If you had given me two years instead of one I might have done something for you"?—I think time and distance had a good deal to do with it.

524. I do not know whether you have anything more to tell us about the cost of pavilions?—I do not think I had quite finished as regards the pavilion at the St. Louis Exhibition. At the termination of the exhibition, when the Commissioner there tried to sell the building, it was found that he could not do so, because it stood on land belonging to the St. Louis University, and they claimed it.

525. (*Mr. Wilson Fox.*) They did not tell them that before they built it, did they?—No. It was the only pavilion standing on St. Louis University property. We then had permission from the Foreign Office, since the building was very much wanted, to present it, but that was not permitted by the Treasury. Consequently, we had to accept their insignificant offer of, I think, about £200 for the whole building as it stood. The exhibitors removed the things that belonged to them, but the building, together with a vast amount of decoration, passed into the hands of the St. Louis University for that sum.

526. (*Mr. Algernon Law.*) From what class were the guarantors of the British participation in Brussels drawn? Were they men of wealth who took a general interest in exhibitions?—No.

527. Or were they manufacturers or what?—I think they were chiefly merchants in the City of London.

528. Do you attribute the comparative failure of this country in international exhibitions to defective organisation rather than to inferior workmanship or class of goods?—I attribute it chiefly to the bad start we always have to make—the late start.

529. What particular class of exhibits have gained most by exhibiting, apart from art, which apparently gained a good deal? Is there any special class?—I am afraid I cannot tell you that.

530. If a country sends its best, collected in a small space, to an exhibition, does that not give foreigners a better chance of copying than if the goods are spread all over a large city or country? It has been mentioned, as you know, that people are afraid to exhibit on account of getting their goods copied?—Perhaps it does give them an extra opportunity, but they already can purchase and copy anything they wish of British manufacture.

531. But it would not be before their eyes, and they would have to go and look for it; they would find it by going to the Exhibition?—That would be so.

532. In your *précis* you say "By the time the Foreign Office has conferred with the Treasury, the Board of Trade, and the Home Office, and arrived at its decision, other countries have not only sent in their adhesion, but have also secured the best spaces." I think that is rather a Treasury decision, or a decision of the Government as a whole, than a Foreign Office decision, is it not?—Yes, I think it must be a Treasury decision.

533. (*Mr. Wilson Fox.*) And it has nothing to do with the Board of Trade really?—No.

534. You have a great experience in these things, and therefore I should like to get on the notes what is your idea of the organisation required for an exhibition. I understand you are in favour of some permanent nucleus?—Yes, I am.

535. Then I understand you are in favour of a committee with experts on it?—Yes.

536. When the Treasury find the money for an exhibition, are you then in favour of a Royal Commission, or who is to be the controlling authority over the committee and over the permanent staff, whatever it may be?—I should say that the controlling authority ought to be a Department of the Board of Trade.

537. A Department of the Board of Trade, do you say?—Yes; I think this permanent office should be an office of the Board of Trade.

538. Do you mean to run the Commission itself? When the Treasury has found the money, and you are about to start getting the British exhibits, do you think that the permanent Department ought to do all the work, putting up the pavilion, and doing the entertaining, and so on?—I think the permanent Department, with the officials of the Board of Trade, should have the controlling voice and should appoint the committee, including a few exhibition experts, and including a selected number of chairmen of Chambers of Commerce to assist.

539. But no Royal Commission, then?—I do not think it would be necessary to have a Royal Commission.

540. (*Chairman.*) Does not a Royal Commission add dignity and attraction?—Perhaps a few ornamental names would be useful, but I think they ought to be few.

541. (*Mr. Wilson Fox.*) Do you think that the people you would have to come in contact with, the people belonging to the art world and the mercantile world, would care to have a Government Department rather than a Royal Commission running the Exhibition on strictly official lines?—I do not think they would mind it at all.

542. I do not think, if you put it to me, that the entertaining would be so lavish under a Government Department, for instance?—Probably.

Sir I. Spielmann. 16 Nov. 1906.

543. One more question, which I think is of some importance, in regard to the permanent staff, whatever it might be, and however small or large. Would you contemplate that the man who was in charge of that permanent staff should be secretary of the larger organisation, whatever it may be, either under the control of a Royal Commission or of a Government Department, which would be required when the exhibition came into being? Here is a man who would be trained for such work and certainly acquiring knowledge, and his salary would very much depend upon what view you took about making him the secretary to the exhibition. Expense is something to be considered in regard to the point we are on. Is he to be just a mere clerk, or is he to be a man who, when the time comes, you would put into a position of very considerable responsibility? If so, you would have to give him a large salary?—I think he ought to be a man who would be eventually appointed Commissioner-General.

544. (*Mr. Malcolm Ramsay.*) Like the secretary of the Commission?—Yes.

545. (*Chairman.*) He should be the man in charge, whatever he is called?—Yes.

546. (*Mr. Wilson Fox.*) My point is that that would very much increase the intermediate expenses between the exhibitions, although I do not say it would not save money in the end?—Probably, but I think he would be most usefully employed as the Commissioner-General afterwards.

547. (*Mr. Malcolm Ramsay.*) I suppose you would have to give him a salary of four figures?—Possibly.

THIRD DAY.

Friday, 30th November 1906.

PRESENT :

Sir Alfred E. Bateman, K.C.M.G. (*Chairman*).
Mr. A. Wilson Fox, C.B
Mr. C. A. Harris, C.B., C.M.G.
Mr. Algernon Law.
Mr. Malcolm Ramsay, C.B.
Sir Swire Smith.
Sir Isidore Spielmann.
Mr. U. F. Wintour (*Secretary*).

Sir Henry Trueman Wood, called and examined.

Sir H. T. Wood. 30 Nov. 1906.

548. (*Chairman.*) I think you are Secretary of the Society of Arts?—Yes.

549. You have been connected with many international exhibitions, have you not?—Yes. My first connection with exhibitions was in 1873, with the series of exhibitions organised at South Kensington by Sir Henry Cole. I had a little to do with the Paris Exhibition of 1878, when I edited the Artisan Reports upon it. My chief early experience of exhibitions was with the Inventions, Health, and Colonial Exhibitions. Then I was the secretary and commissioner for the private committee which organised the Exhibition of 1889 in Paris, and also secretary of the Royal Commission for the Exhibition of Chicago.

550. I understand you think that there are two distinct classes of exhibitions?—Yes. There are first of all the great international exhibitions of Paris (1855, 1867, 1878, 1889, 1900), Vienna (1865 and 1873), Philadelphia (1876), Chicago (1893), and St. Louis (1904). There are also a vast number of smaller exhibitions, such as those at various dates at Brussels, Amsterdam, Moscow, Berlin, Antwerp, Barcelona, Milan, etc. Besides these again are the special exhibitions, Electricity, Mining, Life-saving, Fishing, etc. While the country has taken part in the big international exhibitions, it has always, to a very large extent, ignored the smaller exhibitions—many of which offer rather important opportunities, I think, of developing special branches of British trade.

551. Do you mean special branches of special industries?—I mean branches in connection with the special industries of each country. Take, as an instance, the Barcelona Exhibition of 1888. They had a very fine exhibition of textile machinery from this country, one of the principal exhibitors being Messrs. Platt, of Oldham. I spoke to one of their partners about it, and asked him why he would not exhibit in Paris in 1889. He said, as well as my memory serves me, that he had exhibited in 1878 in Paris to oblige Sir Philip Owen, and that he had got no good by it, but that there was a very large textile industry in Catalonia which he hoped to reach through the Barcelona Exhibition, and that he was doing a very good business there.

552. Was their business in exporting textile machinery increased by exhibiting their textile machinery at Barcelona, did he think?—They are among the largest makers of textile machinery, as you know; and he thought, by exhibiting on the spot—I believe he not only thought, but he found—that he was doing good business, whereas, by exhibiting in a large general exhibition like that of Paris, he did not think that his firm would get much business.

553. Because the users of his particular machinery would not see his exhibits at Paris?—They would not go there.

554. I understand you are of opinion that international exhibitions have entirely changed their character. What do you consider has been the change in international exhibitions recently?—There has been a very obvious change. The Exhibitions of 1851 and 1862, and the other earlier exhibitions, were purely exhibitions of manufactures, of science and of art, and there were really no amusements connected with them. The exhibits were the principal, almost the sole attraction. Now the buildings form the essential feature and the amusements the main attraction. In 1851 there were almost no refreshments—indeed, I think the main provision of the refreshment contractor was an enormous number of penny buns, that is stated in the Report. Now the catering is about the most important department and the receipts from restaurants one of the chief sources of revenue. Many of the late exhibitions were really what they have got to be called —World's Fairs.

555. I suppose that is because you cannot attract people simply by the exhibits?—I do not know what the reason of it is. The change developed, I think, from a feeling of rivalry. They started the idea first of all in Paris of making a very magnificent show, and people caught more and more on to the idea. You will remember that from 1873 to 1874 Sir Henry Cole organised some minor international exhibitions at South Kensington. They were really very good exhibitions, but there was no provision made for entertainment at them, and in 1874 they stopped. It was originally proposed that the series should be carried on for ten years.

556. (*Sir Isidore Spielmann.*) Were they international?—They were nominally international, though they were not really international.

557. Did other countries not participate in them?—Only to a very small extent. However, they were called international exhibitions. Then exhibitions of a very similar character were organised by Sir Philip Cunliffe Owen ten years later—the Fisheries, Health, Inventions, and Colonial Exhibitions—and they were a very great success. I think it was that which first started the idea of combining a sort of respectable Vauxhall or Cremorne with an international exhibition. The French people developed this to a very large extent in Paris in 1878, and more still in 1889, and Chicago carried it on to a yet larger extent in 1893, until at last an exhibition got to be looked upon as a place of entertainment, and not as a place for the development of trade and industry.

558. In your *précis* you say that you do not think there is much business done in various industries at an exhibition?—There is a certain amount of business, but I do not think it is a very large amount.

559. But there is business done in what you call the Applied Art Classes?—Yes. Sales direct to private individuals, mostly retail business.

560. What do you mean by the Applied Art Classes?—All those industries which are associated with ornamental design, glass, pottery, furniture, etc. I think that the British trade in ornamental pottery is entirely the growth of exhibitions It was founded at the Exhibition of 1851, and it has been fostered by other exhibitions. I believe that particular trade has made very large profits indeed by exhibitions. One proof of it is that the manufacturers of that class of goods are always ready to exhibit. They exhibited freely in Paris in 1889, in Chicago, and I believe in later exhibitions.

561. Did they exhibit at St. Louis?—I am afraid I cannot tell you anything about St. Louis. I think I had better say that the Committee must not look to me for any information beyond 1893. What I have to say is all more or less ancient history, for really I have had nothing to do with exhibitions since then.

562. Can you give any other instances except that of the pottery?—I should like to mention what I think is an interesting fact. I think Sir Henry Doulton himself attributed the whole growth of Doulton Ware and the very large business which was founded on it to a small exhibit at Vienna.

563. In what year was that?—It was at the Vienna Exhibition which was held in 1873. Of course, manufacturers of pottery and things of that sort can sell their goods to a large extent at foreign exhibitions, and I think the same applies to a large extent to British furniture makers. I think that they have done very well in exhibitions. The British carriage makers exhibited very largely in Paris in 1878, and I believe they did a very good business for some years; but that it afterwards dropped off. My own impression—I can only give it as an impression—is that the engineering trades, the makers of agricultural machinery, the makers of steam engines and other motive-power engines, and the makers of textile machinery, have suffered rather than otherwise from exhibitions. I think that the Exhibition of 1851 brought a lot of foreigners over here who found out what we were doing, and, to a large extent, copied the machinery of our makers. All exhibitors complain a good deal about their goods being copied. In the case of ornamental things I do not think that that is justifiable, because any rival maker has only to go into Regent-street, and he can see the same goods in the shop windows there that he can at an exhibition. But in the case of machinery that is not so—they do not have the same easy opportunity of inspecting and examining and copying. And I think that the great complaint which exhibitors make that their goods are copied in exhibitions is, as regards machinery, entirely justifiable.

564. That is in spite of the Patent Laws?—In spite of the Patent Laws, and in spite of the prohibitions against copying and photography and all the rest of it.

565. They cannot be imitations exactly, because surely the Patent Laws would interfere?—Patents can be evaded.

566. We know that; we have heard a good deal about patents elsewhere?—The foreigner gets the idea, and he develops it in a slightly different way in spite of the patents.

567. You do not mention the textile industries as having been either helped or hurt by exhibitions; have you any opinion about that?—No. I am afraid I do not know anything about that; I have not formed any opinion about it.

568. On the whole, you appear to think that exhibitions have been beneficial to trade?—I think foreign countries have profited a great deal more by exhibitions than Great Britain.

569. Do you think that we have profited at all?—I think that is a most difficult question to answer. Whether trade on the whole has benefited or not by exhibitions, I really cannot say; I do not know.

570. But individual firms have profited?—Certainly.

571. More by exhibiting than by advertising in the ordinary way?—I think so. If a man wants to advertise he can get more advertisement by spending his money upon an exhibition installation than he can by spending it upon newspapers and hoardings.

572. Coming to the general question, do you think that as long as exhibitions are held we must take part in them?—I think that is undeniable. I think there is no possible question about it. You cannot have a big exhibition held in Paris, and England standing outside it. It may or may not be a good thing to have an exhibition and to exhibit at it, but there is no question whatever that if there is an exhibition and your rivals are showing at it, you have got to show too.

573. It would damage us more in prestige not to show, than to show and let it advantage other countries more than it would advantage us?—Certainly it would. That was illustrated at the Paris Exhibition of 1889. As you will remember, the Government refused to take part in that Exhibition, and a private committee was formed. Before that committee was formed there was tremendous grumbling amongst the various manufacturers at the idea of Great Britain not taking part in it. That showed the feeling of the manufacturers on the whole.

574. There were political reasons, then, I think?—Yes. The reasons were quite obvious; they were known at the time.

575. Now, we come to the question of collective exhibits, on which you have strong opinions, I think?—Yes, I have got very strong opinions about them and I have had for a very long time. My experience has been that it was absolutely impossible to induce British exhibitors to join in collective exhibits. The best example I know of that was at Chicago. We had a large number of exhibitors of pottery at Chicago, and I was very anxious that they should all join together and make one collective exhibit—in fact I had arranged a sort of court, and had a design for it; it was a kind of pavilion. Most of the pottery exhibitors had agreed to this and had agreed to pay their own share of this general pavilion, and to have inside it their own private installations. It was to be divided into various portions, and each exhibitor was to have his own share, and to instal his goods in it. But one of the largest exhibitors of all said, "If you are going to do this, I will not exhibit; I will exhibit on my own account or not at all."

576. Were the names to be put on the separate exhibits?—It was to be a joint collective exhibit. It was to be a pavilion of British pottery in which each exhibitor has his own compartment.

577. Was his name to be on his compartment?—Yes, certainly. It was to be a united exhibit, perhaps, rather than a collective exhibit to which everybody contributed, all the goods being mixed up together.

578. You are aware, of course, that in France and Germany the system of collective exhibits has been adopted for some years?—In France and Germany that system has been adopted to a very large extent, so far as my experience goes. The first I knew of it, and I think the first time it was worked on a large scale was in Paris in 1889. That was an instance of manufacturers exhibiting in their own country, and not in a foreign country. In that case the various French sections were all managed by special committees, each committee arranging with the exhibitors, doing the decoration of their court, and receiving the selected exhibits. The expenses were divided amongst the various exhibitors. The result was that there was a homogeneous exhibition of the various classes of French industry. They were all arranged together, and in

Sir H. T. Wood.

30 Nov. 1906.

harmony. When they exhibited in Chicago they did precisely the same thing, and so did Germany. In Chicago I know, as regards Germany at all events, that the various exhibitors delivered their goods to some central organisation in the country, but I do not know what it was.

579. Some central organisation in Germany, do you mean?—Yes. They were then sent out, and the whole of the installation was done by the German section. It was done on a very elaborate and costly scale. Large and gorgeous pavilions were built in which these goods were installed. How far an individual manufacturer's goods were kept apart and how far his name was put forward, I do not remember; but I think the practice varied in various cases. In some instances the exhibitor had practically a separate installation within the collective exhibit. In other cases, I think, his goods were merely mixed up and shown, of course, with his name attached to them; but the practice varied, to the best of my memory.

580. But you have not personally had to do with the system, and you do not know exactly how the exhibits were selected by the Government?—No; I do not.

581. You are not sure whether there was actual selection, and whether certain goods were rejected or not?—There was some form of selection, but the details of it I do not know. I only know what was told to me. I asked the German Commissioner at the time, and got from him a good deal about it. I was anxious to get the information, because I wanted to do the same thing for this country, but I never could succeed.

582. Have you formed any idea as to why it is that the people of this country are all of a different opinion to those in Germany as to the advantage of a collective exhibit?—I think it is merely the nature of the people. They are jealous of one another. I think the nature of us English people is to work for ourselves and be independent. I think that is the only reason.

583. In Germany they are better drilled, are they not?—Yes, and they are more used to submit to Government organisation, and they are less independent—you can put it in that way.

584. You have not had much practical experience since 1893, I think you said?—Since 1893 I have had nothing to do with exhibitions.

585. So you do not know about St. Louis?—I do not, except that I have heard of it and have taken interest in the subject. I know that in St. Louis the collective exhibit system was, in certain cases, successfully carried out.

586. All you know is that you had very great difficulties in Chicago in getting collective exhibits?—Yes. The same in Paris in 1889. I have mentioned in my *précis* one or two very definite efforts which were made to get special collective exhibits. In Paris the Society of Agricultural Engineers undertook to make a collective exhibit, but that broke down. The Institute of Carriage Builders tried to make a similar exhibit, and that failed. In Chicago the Institution of Electrical Engineers tried to make a collective exhibit of electrical apparatus, but they could not carry it out.

587. In Paris you say that the cost incurred by the contributors of a collective exhibit did not vary much from the cost incurred by separate exhibitors—was that so?—That was so. I found that to be the case at the time.

588. That is a very curious state of affairs?—Yes, it is; but I am quite clear about it. I made the inquiry, and I found that the cost to the French exhibitors of their contributions to the collective exhibit, and their share of the decorations, did not vary much from what our own exhibitors had paid. But that does not really apply to a foreign exhibition, in which the Government pays a much larger share. At Paris in 1889 the French exhibitors bore the whole cost of the decoration of their courts, although they contributed to a collective exhibit. In Chicago the French and the German Commissions paid the whole cost of the installation of the goods, and of the decoration of the courts.

589. Then there is the question of the effect of the exhibition in opening new markets. Take Chicago, for instance, which you are very familiar with. Do you think that there was a good effect produced on the visitors from South America, which is an important market now?—I think both in Paris and in Chicago there was a good deal of business started with South America. I know that I was told in Paris that that was the effect. At the Paris Exhibition of 1889 there were very large exhibits from South America, some of the South American Governments subscribing very large sums for exhibition purposes, and a good many South Americans coming over to Paris. I gathered at the time that their object was to attract French capital. I was told that that had led to a good deal of business coming to French houses from South America, and I know it was anticipated at Chicago that a good deal of business would be done in South America; but I do not know whether that was the case or not.

590. Are you aware that the American manufacturers still complain that they do not do nearly as much business with South America as they think they ought?—That I do not know.

591. And that we still continue to do more business in South America than they think is fair, considering they are in North America?—I know we do a large business there.

592. Now, I think, we come to the question of the machinery for organising an exhibition. I understand that you do not believe much in a Royal Commission being the ideal machinery?—No, I do not. I think a Royal Commission is a singularly cumbrous instrument for the purpose, and most unsuited for the work. A Royal Commission is a very bad executive instrument. The first Royal Commission for an exhibition was really a one-man Commission—it was Sir Henry Cole, and nobody else.

593. When was that?—That was for the Paris Exhibition of 1855. The later Royal Commissions were under the presidency of His Majesty, who was then Prince of Wales, and the secretary was Sir Philip Cunliffe Owen. I think a combination of that sort was an admirable instrument, because His Royal Highness took an active and energetic interest in the work, he knew all about it, and the Commission had all the benefit of his great influence, and also his very considerable business powers. At the same time, they had the advantage of the admirable organisation of Sir Philip Cunliffe Owen, who was an extremely able and excellent organiser. I think a Royal Commission which consisted practically of the Prince of Wales and Sir Philip Owen was as good an instrument for working an exhibition as you could have.

594. Did that Commission meet often?—The Commission met very seldom; but the Commission practically, for all executive purposes, consisted of the President of the Commission and the Secretary, the other members being ornamental. No Committee, least of all a Royal Commission, should undertake to carry out executive work, and for that reason a large Commission seems to me to be a most hopeless instrument for carrying out a very difficult piece of work, such as the organisation of an exhibition is.

595. But I suppose it attracted exhibitors because there was a dignity about it?—Of course, a Royal Commission inspires confidence, and for that purpose it is very valuable. What is really wanted is some permanent organisation in the country which will deal with all exhibitions.

596. Have you seen something of the organisation of foreign countries at those exhibitions that you have been connected with?—Yes, I saw a good deal of it.

597. What has their organisation usually been?—I think they have always appointed one Commissioner, and made him responsible for the work, as far as I know. I think that is the universal practice.

598. I suppose that would be an office of some dignity?—Of course, he was a person of a certain importance, but I do not know that it was an office of very great dignity. He was an important Government official.

599. Was he a man who could do the work himself?—He was the man who actually did the work.

600. He was not an honorary person?—Not at all as a rule; indeed, I do not remember any case in which he was. The foreign Commissioner really was the man who did the work, and was responsible for it.

601. You seem rather inclined to favour a sort of

commission on which you would have one of the Royal family at the head with a very capable commissioner under him?—No; I think that was an accidental circumstance which would not be likely to be repeated. I should certainly be in favour of the appointment of some definite capable man as the commissioner.

602. Would you have that commissioner appointed for each exhibition, or would you have him a permanent officer?—If it were possible for you to have a permanent officer, I should be inclined to think that would be better. I think there certainly ought to be a permanent department, and the head of that department would be a very natural man to act as the commissioner for the more important exhibitions.

603. Do you think you would pay him a large salary?—I suppose a man of that sort would get the kind of salary that the permanent head of a Government department would get.

604. A department, or a branch of a department, do you mean?—A branch of a department.

605. What department of the Government would you naturally assign this permanent department to?—I should imagine that it ought to be distinctly a department of the Board of Trade.

606. You are aware, I dare say, that the conduct of exhibitions has been altered in that respect?—It used to be under the Science and Art Department, I know.

607. I think before that, 40 years ago, it was in the hands of the Board of Trade. Have you any knowledge of that?—I never knew of the Board of Trade having anything to do with the organisation of an important exhibition.

608. But now you think the Board of Trade would be the most suitable department to connect this organisation with?—The Board of Trade would seem to me to be the only possible department for it. I can see no reason why the Board of Education, which is the present title of the old Science and Art Department, should have anything to do with exhibitions. It was merely the fact that the South Kensington Museum was under the Science and Art Department, and its association with the 1891 Exhibition that, I think, led to exhibitions being put under the same Department.

609. Of course the Board of Trade have very little or no knowledge as regards the Art part of it?—That would be so; but then the ostensible object of an exhibition is not to deal with matters of Art, if Sir Isidore Spielmann will forgive my saying so, but with matters of industry and commerce.

610. Why do you wish to have a permanent department?—Every time that an exhibition is held, the whole thing is treated as if an exhibition had never been held before. A fresh commission is appointed—or at least that was the practice—and somebody is appointed as its secretary, and he at once starts to get all the information, just as if the whole thing was not really cut and dried. There is no place existing where that information has been collected.

611. I suppose the secretary comes to you more than to anybody else for old exhibition records?—The Society of Arts has got, I believe, the largest collection of exhibition literature, and I was very glad to be able to place a portion of it at the disposal of your secretary, who has borrowed a large number of books. There is also a very full collection of Exhibition Reports, etc., in the library of the Victoria and Albert Museum. Probably they have a good deal which we have not. A place of permanent record is very much wanted, and that, of course, a department would supply. Now whenever the question of an exhibition, especially a minor exhibition, comes up, it is discussed or talked about whether the country should take part in it; but there is no tribunal, or no person rather, who can deal with such a matter with authority. Naturally, if there was a permanent department the question would go to that department, and they would decide almost at once what the character of the exhibition was, whether it was worth while taking part in it, and whether a grant ought to be made, and if so, how much.

612. Would you advise our taking part in a big town or city exhibition if it was international—a big provincial exhibiton you may call it, not one held in the capital, but one like the Liège Exhibition, or the Antwerp Exhibition?—That is exactly the sort of question that would have to be looked into on its own merits.

613. Each time it would have to be considered on its merits?—Each exhibition has to be considered on its merits, and with a permanent department you would have somebody capable of dealing with the question.

614. Then about the details of the management of exhibitions; do you think they have been properly done in this country?—Yes; I do not think they can be improved upon.

615. Have they been done as well as they have been done by foreigners?—I think a great deal better. As far as my experience goes, the whole system was arranged in the first instance by two very capable organisers, one Sir Henry Cole, and the other Sir Philip Owen. I think very little has since been done except development on the principles laid down by those two men. I am quite certain that, as I say, up to the time of which I have any knowledge, the organisation of the British section was far and away superior to that of any other country. Foreign Commissions used to come and ask us how things were to be done.

616. Do you think that Government authority is a necessity for exhibiting?—I think that is absolutely essential in the case of both large and small exhibitions even. It was done once without the Government, but that was a sort of *tour de force*. We were able to organise a British section in Paris without Government assistance, but it was a matter of very great difficulty. It might be done again, but not easily. The lack of Government support and authority was very injurious. Of course, there was one advantage, that not so much was expected from a private committee, and consequently the limited funds available could all be expended on what was absolutely wanted. We were not expected to put up any big buildings, or do any expensive decorations, and so on.

617. And I suppose there was not so much entertaining?—There was no entertaining whatever, except on the part of private individuals.

618. Did you attach much importance to all that entertaining?—I think so. I think it tends to goodwill.

619. It costs a good deal of money, but you would limit the amount very strictly, would you not?—I do not think it wants to be done at all on a lavish scale, but still there must be a certain amount of entertaining and hospitality going on. If one nation does it another has to.

620. And you think it is difficult for us to entertain less than other nations do?—It is difficult for us not to entertain at all if the other people are doing it; but I think that to a very large extent it can be left to private initiative.

621. I do not quite understand what you mean by "private initiative" in this connection?—I mean that it could be left to private individuals to entertain.

622. And that the entertaining should not go into the cost to the Treasury of this country?—I think it has generally been the practice that a certain amount has been spent on entertaining out of the sum allotted to a commission, but it has always been a very small amount.

623. What amount did you spend at Chicago?—In Chicago we had a grant of £60,000.

624. Do you take that as a fair average of what we ought to spend at a big international exhibition?—That is not anything like enough to allow this country to compete on equal terms in the way of ostentation and show with other countries. Germany is said to have had a grant of £170,000. I asked the German Commissioner what amount he had to dispose of, and he told me that he had practically got *carte blanche*, and he could have as much as he liked.

625. Besides that amount?—Yes.

626. So that he might have exceeded the £170,000?—It is a long time ago, and I do not remember exactly what he said, but it practically came to this: that he was able to spend any amount in reason which he required. The expenditure of the German Commission at Chicago must, I am sure, have considerably exceeded £170,000.

627. In what particular were you hampered by not having so much?—Mainly in the way of the decoration of the courts. France and Germany must have spent very large sums on the interior pavilions which

Sir H. T. Wood. 30 Nov. 1906.

they set up, and the result was that while many of our British exhibits were superior they were not so well displayed. It seems to me quite an unreasonable thing that a foreign Commission should go and put up ornamental structures of that sort. They are very often not wanted, they spoil the effect of the big building in which they are put, and they are very much out of place; but still they are advertisement and ostentation, and they lead people to say what a much finer exhibit France or Germany made than England, whereas that really is not the case—it is only that they have got a lot of fine plaster of Paris pavilions.

628. A more florid decoration in fact?—A more florid decoration, and much more elaborate looking structures. It is a matter for much regret that the competition between different countries is rather a competition in the attractiveness with which the goods are displayed rather than in the merits of the goods themselves.

629. You speak of the foreign expenditure as being very large at Chicago; that was mainly on decoration, I suppose?—It was really quite impossible to find out what the foreign countries did spend, but the grants which were stated amounted altogether to a million and a half. I think the figures are quite unreliable; many of the countries spent more than was stated, and I do not believe that a number of the countries spent half what they said they did.

630. Would that million and a half be the total expenditure of the countries, whether by the Governments or by private individuals?—No, that was only the Government vote.

631. Surely in many exhibitions the exhibitors spend a good deal in decoration, do they not?—Yes, certainly. At Philadephia the then Commissioner, Sir Herbert Sandford, tried to get information as to the expenditure of individual exhibitors. He worked it out that the average expenditure of each industrial exhibitor was £190, and that the value of the goods he showed was about £400. I did the same thing at Chicago, and I found that the average value of the exhibit was £715 and the average amount of expenses £374; that was as far as returns were made, and I believe that those returns were fairly trustworthy. That means that the total expenditure of the British exhibitors at Chicago was £115,000, which you see is not very far from double the amount of the Government grant.

632. I suppose that at Chicago the very large area which I remember was occupied, and the great distances between the different pavilions, made an addition to the cost?—Yes. The enormous size of modern exhibitions adds very largely to the cost of a foreign section. All the thing is cut up, and you must have a larger staff distributed over the larger area. If you have all your exhibits in one place one man can superintend them, but if you have them in a dozen places, you must have a dozen men to superintend.

633. Are you in favour of exhibiting by countries or by sections or by subjects?—There is no question whatever about the advantage of exhibiting by countries, but that has got to be somewhat impracticable in modern exhibitions which are so big. You can never carry it out entirely now. Indeed, it was never quite possible. Certain exhibits require special accommodation, *e.g.*, you must have machinery in a separate building, because of course you want the power. I think there is no doubt that for a foreign country it is much better to have all its exhibits close together; they make a much better show then, and of course the country does not have to spend the same amount on decoration. You can decorate one building when you cannot decorate a dozen. The separation into classes tends to the advantage of the country holding the exhibition, because the foreign sections are all split up, and therefore rendered much less imposing.

634. Do you think that exhibiting by classes would rather decrease the cost?—If we were allowed to put all the exhibits of the British section under one roof the cost of exhibiting would be diminished very largely.

635. But having to spread them under different classes increases the cost?—It is very much more costly. It is the French who first started the division into subjects.

636. In what year was that?—That was in 1867, I think. The building was circular in plan, and the allotments to countries by sections, so that it was intended to combine both systems. By following a radius of the circle you passed through the court of a particular country. Going on a circular route, you could see all the contributions of each country to a special subject. But the system had obvious difficulties, and was not, I believe, thoroughly carried out.

637. The early exhibitions were not opened in the evenings, I think?—That was so. Opening them in the evenings makes a very much longer day; that is not a very great additional cost to the sections, but it does add something. The main additional expense, lighting, is borne by the exhibition authorities.

638. I suppose the evening opening attracts very large numbers; that is the advantage of it, is it not?—Yes. I should think that in Paris there were many more people there in the evening than there were in the day.

639. Then we come to the question of awards. Have you any strong views about the best system of awards at exhibitions?—I have got a very strong view about that. I think the best system is to have none at all.

640. Do you think people would exhibit all the same?—I do not think it would make a great deal of difference. I know when I was in Paris before the French Exhibition of 1889, I was talking with M. Berger, the French Director-General, and I rather strongly recommended him not to have any awards. His answer to me was that none of my fellow foreign commissioners would agree with me, and I believe he was perfectly right. I think that if you could poll British exhibitors they would be quite content not to have any awards, provided nobody else had them; but I do not think that would be the case with foreign exhibitors, who have not got so many medals as most of our people have.

641. When did they cease to give awards? Now, I believe, you get a certificate that you have an award when you have not, and you buy your medal yourself when you want one?—That is so in some cases.

642. Is it not universal now? Take Chicago?—At Chicago they gave a medal.

643. Did they give you medals at their own cost?—Yes, one medal, not different classes.

644. But they did not give gold medals, did they?—No, a single bronze medal. Of course, there are various systems. First of all, you may give gold, silver and bronze medals, or you may give one medal of one value—no different classes of medals, but only a single medal; or you may offer gold, silver and bronze medals, and then tell the people that they may buy them themselves if they like.

645. That is the present system as a rule, is it not?—Hardly, I think. It varies a great deal. In Paris they have lately awarded medals of different categories, and presented a bronze medal with a certificate for a gold or silver medal.

646. Which you may buy at your own cost?—Yes.

647. Can you tell us whether, in the earlier exhibitions that you were connected with, the actual medals were given by the authorities?—Certainly. At the earlier exhibitions the actual gold and silver and bronze medals were given. When that was first dropped I do not remember, but I think they were actual medals that were given until the Paris Exhibition of 1889. I can look that up and add the information.

648. It is not a very important point; the methods of awarding is a more important point?—I do not think there has ever been any improvement on the original method devised for the exhibition of 1851. It is impossible to award medals fairly. No committee can come and look at a man's exhibit and decide on its merits by looking at it. If you have to test the exhibits the exhibition would never be over, but would have to go on for years and years. Attempts have been made on various occasions to analyse and test goods, but never very successfully. In Paris in 1889 they were quite candid about it. They sent a form round—and I expect they did the same at the last exhibition—asking how many employees the manufacturer had, what were the extent of his works, and so on, in order to guide the jury as to whether he ought to have a medal or not. They were comparatively little influenced by the appearance of the goods. To a certain extent they judged the goods, but they were

guided by the man's reputation more than anything else. I think that is the fairest way of doing it.

649. Would you give the prizes to the biggest battalions of industry?—I would give them to the man who has got the best reputation. If you have a good jury—a jury of experts—they know perfectly well what a man's manufactures are like, and they are not guided by what they see in the exhibition, because they know a great deal more about his manufactures than they can learn by going and looking at them. It is a rough and ready system, but I think, on the whole, it is the fairest. The system in Chicago, and, I believe, it was the same in St. Louis afterwards, was hopelessly bad.

650. What was that?—They decided that the awards should be made by individual judges. A certain number of judges were appointed, and each judge was to have a certain number of exhibits, and he was to go and to report on them individually. The result was that some of the judges abandoned the system, and did not follow it; they formed themselves into committees and went on the old system. Some, I am sorry to say, took bribes. There is no reason why I should not say so, because it was notorious; they were prosecuted, and convicted, and punished. I think a great many more were amenable to influence, without being actually corrupt; and a great many were quite incompetent. Then every judge had his own standard; some gave away medals freely, others only in cases of superlative merit. The American system of single judges seems to me to be the worst that was ever devised for giving the awards at an exhibition. I am not certain what they did in Philadelphia, but I think they had something of the same plan there.

651. I suppose, from your experience, there has always been a certain amount of international jealousy in connection with the awards of medals?—I think it has always been considered that one of the principal duties of every commissioner is to get the largest possible number of medals for his own section.

652. Independent of the value of the exhibits?—Yes, entirely independent of the value of the exhibits or anything else. Some commissioners have been more scrupulous than others. I hope that on the whole British representatives have been reasonably honest, but everybody always did try to do the best for his own section as far as he fairly could. I think we have always been fair about it. But I should like to say that, in spite of the enormous number of exhibition medals, the way in which they are granted, and the contempt with which they are regarded in many cases, exhibitors, as a whole, look upon medals as important, and value them considerably.

653. You spoke of the contempt with which they were regarded. Who has the contempt for them—not those who receive them, surely?—I think everybody who knows about the way in which they are awarded does not look upon an exhibition medal as any great testimony of excellence, though it may be of a certain amount of reputation.

654. The fact is advertised a good deal by the people who have got them, is it not?—Yes. The people who get them are, of course, pleased with them.

655. Do you not think they have a value for trade purposes?—Yes; but I think more value is attached to them than ought to be.

656. And you would like to see them done away with altogether?—I should like to see medals done away with altogether. I do not think it would be a loss to the exhibitions, because I think exhibitors would exhibit just as readily—I am only speaking of British exhibitors—and I think a great many would actually prefer that they should not be put quite so much in competition with their rivals. A man is often more anxious that his rival should not get a medal than that he should get one himself. In some cases I am sure the fact that medals were to be awarded has prevented English manufacturers from exhibiting. They were afraid, not so much of not getting an award, but of rival houses getting awards in competition with them. I believe myself that the general feeling of English exhibitors is not in favour of medals. Naturally this feeling is strongest on the part of those who have actually got a number of medals.

657. I think we now come to a question which is a little outside our reference, and that is the possibility of an international exhibition in London. I do not think we can go into that, except generally. You think that we can hold a Greater Britain Exhibition in London without loss at the present time, do you?—All I have to say about that point is that I am fully convinced that you cannot hold a big international show in London, because you cannot get the money for it, and there is no source from which you can defray the absolute and certain loss. Every big exhibition means a heavy loss, wherever it is held, which has to be defrayed by somebody. The exhibition itself makes a loss, although it may bring in an indirect profit to the country or city where it is held. But it means a direct loss, and that loss has to be defrayed by somebody or other. There is no source in London from which that heavy outlay can be provided.

Sir H. T. Wood
30 Nov. 1906.

658. And you do not think our manufacturers would subscribe to that?—No, they would not subscribe on that enormous scale; it is a question of millions. At the same time, I think a small exhibition, a moderate exhibition, without too much ostentation and of a genuine character, if it was thought desirable to hold one, could be held without loss.

659. (*Mr. Algernon Law.*) Which sort of exhibition is most useful commercially to exhibitors, do you think—the international or the local, or a special exhibition such as the electrical exhibition?—The special exhibition first of all. That is very useful. The electrical exhibitions which have been held have been of very great value.

660. You think that no good result has followed from the exhibition of British engineering and machinery?—It is my impression, on the whole, that British machinery and engineering has not profited by exhibitions.

661. Do you think it would be a good thing not to exhibit in those classes, while exhibiting in the others?—I do not think so, certainly; but our manufacturers appear to think so, because they are very reluctant of late years to exhibit in those classes. They used to exhibit very freely in the earlier exhibitions, but now they do not.

662. If, as some people seem to suppose, we do not get our best people to exhibit, does not the reputation of the country as a manufacturing nation receive injury from an inadequate representation?—I do not think, as a matter of fact, that occurs sufficiently to make it a very strong argument. Certainly in classes in which second-rate manufacturers only exhibit we do get discredit, and that has happened.

663. Do you think if collective exhibits were paid for entirely by the State, that even those who are now reluctant to come forward would come forward and exhibit?—I think so, if they are properly organised. I think that it can be done, as has been shown to a certain extent at St. Louis. I am quite sure that manufacturers would be willing if they knew that a collective exhibit was going to be made to contribute to it, if they were not put to any great cost or to any great trouble. They would do it from patriotic motives, if from no other; any of the large makers would be willing to contribute.

664. You consider that the management of exhibitions should be carried out by an expert, but do you mean an expert in the organising of exhibitions, or an expert of great capacity in trade?—What was in my mind was that we should have a permanent department, and that they should have officials who would be able to do the work, so that a man has not to learn his business afresh when for the first time he has to do the executive work of an Exhibition Commission.

665. Yet you say in your *précis* that as regards the details of management we have nothing to learn from foreigners; does not that statement imply that we need not have an office such as France has?—No, because I think we do it after an enormous amount of unnecessary trouble, but it could all be cut-and-dried. It is exactly the same thing in every exhibition, you know; the same work has to be done.

666. You say the chief item of expenditure is the exhibition of pictures; do you think that they might be cut out altogether in future exhibitions, on the ground of expense?—No, I do not think so; but I think you must remember that it is a source of unprofitable expenditure. I think it would be a great pity in a large exhibition if there were a gallery of pictures and the British school was not represented;

Sir H. T. Wood.

30 Nov. 1906.

but you must not put that down to the benefit of industry and trade, and of course it is absolutely unprofitable. It must always be paid for, and it is a very heavy item of expense. If an artist has a picture he wants to sell, you can ask him to show it, and to send it, and to pay for its insurance; but as a rule we want our artists to be represented by their best work, that is, generally, by what they have sold, and not by what they have got on their easels; and then, if you go and borrow a picture from a man you cannot expect him to pay the cost of showing it.

667. With regard to the expenditure on buildings, you say in your *précis* that the grant cannot be made dependent on conditions. What sort of conditions do you infer; are you thinking there of the limits of expenditure?—When making that note I was thinking of the seventh question which you are sending to witnesses, namely, "Assuming that public money is, in any case, granted to the organisation of official exhibits, do you consider that the grant should be made subject to any special conditions as regards (a) the accommodation and facilities offered by the exhibition authorities; (b) the number and quality of exhibits offered by British firms?" I do not think you could lay down any conditions. I think that the proper authority would be able to decide whether the necessary conditions were likely to be fulfilled, and would regulate the grant accordingly.

668. At Chicago did the Germans and the French entertain at the public expense?—Not to any large extent. I should think the outside they did was to have one big dinner and one or two receptions, or something of that sort.

669. I think you said that though British exhibitors would themselves be glad to dispense with awards, they would not be inclined to go in for a self-denying ordinance unless foreigners also went in for it?—That is so.

670. You do not think the British exhibitors would be disposed to exhibit without awards, while all foreigners were receiving them?—No, I do not suppose they would. You see, you would then have the foreign manufacturer who would be advertising his award, and we should have no Englishman able to advertise his.

671. (*Mr. Harris.*) In referring to the Paris Exhibition of 1889, I think, did you not tell the Chairman that the cost of a collective exhibit to the French exhibitors did not greatly differ from the cost of the individual exhibits of British exhibitors?—In the British section that was so.

672. How do you mean, in the British section?—I mean that the cost to the individual French exhibitor and the cost to the individual English exhibitor was not very different. Although the Frenchman was in his own country, if he was showing in a collective exhibit, supposing he was exhibiting on the same scale as an Englishman, it would cost him about the same.

673. That was due, perhaps, to worse organisation?—I should think it was due to some fault in the organisation.

674. You would have naturally expected it to come out very much more cheaply, would you not?—Yes, and I was very much surprised when I heard it. The French exhibitors complained a good deal about the expense to which they were put by their committees.

675. So that the French would not claim what I should have thought was a general result of exhibitions, that the greater benefit would accrue to the country in which the International Exhibition is organised?—Yes, they would, I think.

676. Then, you do admit that that is the principle, as a rule?—Certainly; that, I think, is undoubted.

677. If you admit that principle, does it not strike very much at the root, for instance, of Great Britain exhibiting in any foreign country?—Not entirely; because, although the native as a whole gets the best of it, the foreigner, if he was left out altogether, would be worse off still.

678. And supposing, as you said, that the decoration of a section carries much more weight than the actual industrial exhibits, do you not think that that again has cut out the British exhibitor?—It has not cut him out altogether, but it has affected him adversely, certainly.

679. And has made it scarcely worth his while to exhibit?—That is what a good many of them think, and so they do not exhibit.

680. Then, again, taking another point in your evidence, if the award is not given on the merit of the exhibit, but is simply given to the firm with the best reputation, have we not once more got a reason for really cutting ourselves out of exhibitions altogether?—I do not think so, because the advertising value of the award is equal, however you get it,

681. Then, you come round to the fact that there is an advertising value, and a considerable advertising value, attached to an award?—I did not mean to say that there was not.

682. I rather gathered that you did?—No; a medal has an undoubted advertising value. Not what it once had, but still considerable.

683. Do you think it is just possible that in the last ten or twelve years, since the Chicago Exhibition, the feeling of the trader as to exhibitions may have changed, and that, as a consequence, some of the views which you have indicated may be no longer applicable?—I do not think so, because, although I have not had anything to do with the organisation of the later exhibitions, I have naturally been a good deal interested in the subject, and I have watched all that has gone on.

684. (*Mr. Malcolm Ramsay.*) You have referred to the smaller special exhibitions, and have said that they were neglected; do you suggest that the public ought to spend money on these special exhibitions?—Yes. I think in each case the question ought to be properly considered, and I think in many cases a very small grant would be quite sufficient. What is really wanted is organisation rather than the expenditure of money.

685. As these smaller exhibitions are specialised—as an instance take the Textile Exhibition—surely it is much more worth while for the individual trader to go to them and push his goods there at his own expense than it is for him to exhibit at a big International Exhibition?—Yes; but then, he wants a little organisation to help him, although he does not want any money spent. In most of these minor exhibitions I should think that what is really wanted is someone who can act as the British Commissioner, and if anybody wants to exhibit, can arrange that he has an opportunity, and so on. The expenditure would be insignificant.

686. You do not contemplate that the State should bear the cost of the installations at exhibitions of this kind, any more than it does at the Olympia Motor Show, which is a sort of parallel?—No, but merely that the British exhibitor should be able to exhibit if he wants to.

687. You have referred to the exhibitions organised by Sir Henry Cole and Sir Philip Owen; I forget whether they were State-aided in any way; did the State give any financial grants to these exhibitions?—With regard to the later series, the Fisheries received some subscriptions, but the others had little or no support of that sort. They were not aided by the State, and on the whole they made money. The Imperial Institute was started with the profits of these exhibitions.

688. They were organised, not as a speculation, but on a purely commercial basis, were they not, and the expenses were paid by the entrance fees and the amusements?—I should call them amateur rather than commercial. Nobody connected with them wanted to make money.

689. (*Chairman.*) But they got the ground lent them, did they not? They were held in the buildings and on the ground of the Commissioners of 1851?—Yes, but they paid rent to the Commissioners and also to the Albert Hall. They also paid rates and taxes. The buildings were nearly all new. With regard to the earlier exhibitions, 1871-4, they were subsidised by the Commissioners of 1851, who paid the resulting deficit of £20,000.

690. (*Mr. Malcolm Ramsay.*) You were speaking about the business done by individual exhibitors at the large exhibitions, and you said that the benefits were partial—that some trades, for instance the pottery and furniture trades, got a good deal of business in consequence, and that others did not. Does that not rather suggest that the Government, in giving large grants to these exhibitions, is subsidising some particular industries and not trade generally?—That is hardly a fair conclusion, I think.

691. At any rate, some trades get much more benefit out of it than others?—Certainly, some trades profit much more than others; there is no doubt about that.

692. You were speaking of exhibitions being a cheap form of advertisement for individual traders. Did you mean that traders who exhibit at their own expense at an exhibition have a cheaper advertisement than they would have had by ordinary trade advertising?—That is exactly what I meant.

693. Even though they pay all the expenses of their installation?—Yes.

694. Take the Paris Exhibition of 1889 as an instance. Do you think that the exhibitor there got a better advertisement than if he had spent his money in having, say, new posters?—I do think so. He got his name up there in a conspicuous position for a long time—six months.

695. If it is a cheap form of advertisement, on that basis why should we not expect the exhibitors to bear a larger proportion of the expenses than they have borne lately?—The fact is that they will not do it.

696. If they do not do it, does that not rather point to the fact that they do not think that it is a good enough advertisement?—Yes; many, I believe, do not think so. A great number of exhibitors would not agree with me on the subject; I quite feel that.

697. I am only asking you what is your own opinion?—I think that if a man has got anything which he wants to advertise, whether it is soap or anything else, which he wants to bring before the general public, he can get a very good advertisement by having his name up in an exhibition. But I do not think that in the case of the manufacturer of a steam-engine that argument of necessity applies to him, because he will not want to advertise to the general public; he wants to get at a special and limited class.

698. You said that so long as exhibitions are held we must take part in them. I suppose that is merely on grounds of policy?—It is purely on grounds of policy.

699. And therefore the question of whether the benefit to the trade is sufficiently great does not really come in?—No.

700. Because we have first to consider the policy of the matter, and usually we are bound to answer in the affirmative; and, that being so, the benefit to trade is a less important consideration?—I think the question of policy settles it—according to my own views, you know.

701. Following up the point raised by Mr. Harris as to the effects of an exhibition in opening up new markets; the new markets opened up go to the traders in the country where the exhibition is held, do they not?—No, not necessarily.

702. Does an Englishman exhibiting in Paris open up a new market?—There is no reason why he should not get customers from Brazil or the Argentine.

703. Would not the customers who came over from Brazil to Paris naturally give their orders to French firms? They would have a larger opportunity of seeing French products?—Certainly they would, and they would be more likely to give their orders to French firms; but, on the other hand, they may not find what they want in a French firm.

704. Then, in a very secondary sense, it opens up markets to foreigners who go and exhibit in a foreign country?—No, I do not think so. It may be rather important, but about the practical result I think it is very difficult to say, and I think it would be a mere matter of opinion. You see, manufacturers are not very fond of telling you what their business is and how they get it.

705. Do I understand you to think that the public in England should give more financial support to exhibitions in the future than it has given in the past—I mean give larger grants for the purposes of organising British representation at exhibitions?—With regard to the large exhibitions, I think they ought—certainly larger than they have given recently.

706. You would admit that this would mean a considerable sum of money, I take it?—It would mean an amount of £100,000 or £120,000 for each exhibition.

707. And I suppose they would recur at intervals of three or four years?—They will not recur so frequently in the future. The French will go on having them in Paris every ten years; but I do not think many other people will want to have them. There will not be one in America for a long time. I think they have had enough of exhibitions there.

Sir H. T. Wood.
30 Nov. 1906.

708. If the Government wished to spend £100,000 every year for the benefit of trade, and had a free hand, do you consider that it would spend it most usefully on exhibitions?—I do not quite know that I am prepared to give a definite answer to that. First of all, I do not think it can possibly recur every three years. If it happened every ten years, I am inclined to think it would be a wise expenditure; if it were to happen every three years, I should say it was a matter for further consideration.

709. If it is to recur often, the financial burden becomes very considerable?—Certainly.

710. And though one may have to take part in these exhibitions on grounds of policy, the benefit to trade is not so beyond question as to justify the spending of that money merely for the sake of pushing trade, is it?—I quite agree with that.

711. Speaking of the permanent department that might take charge of exhibition work, I suppose it would meet your view if the work were affiliated to some department; that is to say, if it was the duty of one recognised department and one particular official in it to deal with exhibition questions?—Quite so, so long as there is a permanent organisation, and also a place where all the connected knowledge can be stored.

712. You do not want to create a sort of separate department under a separate name, whose business it will be to find grist for its own mill?—No. I think it is very likely that there might not be enough work for anything in the nature of a separate department.

713. Then you said that this department would have to decide how much any grant would have to be. I presume you would mean that it would advise on that point?—They would put it on the Estimates, I suppose.

714. Surely that is not within the function of any department except the Treasury, and the decision must ultimately rest with the Chancellor of the Exchequer. You do not mean to transfer such a power to the department?—All I mean to do is to enable them to say if you go in for this Exhibition we shall want £500 for it, and that would go on the estimates of the department.

715. Then they would have to apply to the Treasury for authority to provide the money?—Yes, just in the ordinary way.

716. (*Mr. Wilson Fox.*) In your *précis* you say that exhibitions are for individual traders a cheap form of advertisement. I can conceive, and I put it to you, that a trader might get more by advertising his goods in this country than he would by advertising them in a foreign country; would not the number of buyers in England be greater?—I suppose that would be so in some cases, but not in others.

717. One or two witnesses have drawn our attention to the increased disinclination of manufacturers and traders to show at these exhibitions; what do you say as to that?—Certainly, that is so.

718. It would look on the face of it as though they were rather withdrawing from that form of advertisement?—That is so.

719. Then you say later on that a Sheffield manufacturer exhibiting may bring trade to Sheffield, but not necessarily to his own house?—Certainly, that may be so.

720. It is not that form of philanthropic advertisement which he is really courting, is it?—I know they feel that, and that is one of the objections. That is where the advantage of the collective exhibit comes in.

721. You say there has been a tendency to lessen the number and extent of manufacturing, engineering, and scientific exhibits, and to increase those of a decorative and ornamental character, such as furniture, pottery, etc.?—That is so.

722. And you add, I see, that that same tendency exists abroad, because you say "this is noticeable, especially in the foreign sections"—I meant that the manufacturers of the country in which the exhibition was held will exhibit machinery and other things to a

Sir H. T. Wood.
30 Nov. 1906.

much larger extent. By "foreign sections" I meant foreign to the country where the exhibition is being held, not foreign to our own country. The French manufacturers of machinery will exhibit machinery largely in Paris.

723. Will they exhibit in America?—No, they will not.

724. (*Sir Swire Smith.*) The difficulty of the tariff on getting their goods there would be one objection?—There are many objections. They will not do it.

725. (*Mr. Wilson Fox.*) Would they exhibit in Vienna, which is much nearer?—I do not think so, unless they have special reasons.

726. Is that because manufacturers are beginning to find that it is not a good form of advertisement, do you think?—I do not know, but I think as a rule they feel that it is not.

727. It has been said that we do not find enough money here for these exhibitions; it has also been said that the collective method which has been adopted by foreign governments is the right one, and is better than the one we have hitherto pursued, except at the last exhibition, but notwithstanding that, I understand that still foreign manufacturers will not show out of their own country?—That I really hardly know.

728. Then you say that many industrial firms have owed their prosperity to exhibitions; do you mean by that they have gained a reputation abroad and got orders abroad, or that it has been beneficial to them in this country because of the awards?—I mean that firms in this country have actually founded their business by it. They have begun almost by making a small exhibit at some exhibition, and the business they have got upon that has enabled or assisted them to develop.

729. I was going to ask whether they had got a great reputation, and therefore made business through it, in this country, or had got a foreign connection and foreign trade?—I did not mean that they got a foreign trade, because I do not know about the foreign trade. Of course I do not like to mention any names.

730. Then I see you say that some of our people here, particularly the engineering and mechanical industries, have rather avoided showing at foreign exhibitions, owing to the encouragement and help they have given to the establishment of rival manufactories in other countries. That suggests rather than these particular manufacturers on the balance have got more to lose than to gain by showing?—Than English manufacturers have?

731. That the very advertisement which they are endeavouring to gain for themselves has been the means of helping their rivals more than themselves?—I think it is not so much the advertisement that they gain for themselves as the fact of their showing their actual goods to their foreign competitors.

732. And having them copied?—Yes.

733. That is in those particular trades there would be a balance of loss to these particular manufacturers?—That is what I think.

734. Do you think that would always be the case?—Yes; the conditions are always the same.

735. Therefore the more efficient we are in certain trades the greater danger there is for our people to show their products?—Yes. The first exhibition of all, the Exhibition of 1851, was very far from being an unmixed advantage to British trade.

736. Would you say that on the whole you think exhibitions have been a good thing for British trade?—I think so, certainly. On the whole I should say yes.

737. Do you think, on the other hand, that we have learnt anything from the foreigners by attending exhibitions and looking at their goods?—I do not know; I have not any opinion about it.

738. I notice you say that our organisation is as good, or rather, better, than that of the foreigners?—I am sure it was. I think I may say without impropriety, although I have been responsible for a certain amount of it, that I think the British organisation has been better than the foreign.

739. If that is so, and the foreign Governments find so much more money, our people, in the way of organisation, at any rate, are getting more for their money than the foreigners do?—Yes. You can put it in that way if you like.

740. Take the enormous sums which we hear the Germans spent; if, notwithstanding that, our organisation is so much better, it seems that there is a considerable amount of waste somewhere with the Germans?—Not necessarily; the Germans got more show for their money, and in an exhibition show is the great thing.

741. Do you mean that they show more things than we do?—They do not show more things, but they show them in a more attractive way.

742. Notwithstanding our better organisation?—Certainly. You cannot put up plaster of Paris palaces, however good your knowledge or organisation may be, unless you have got the money to pay for them. That is what it amounts to.

743. Do you think that the plaster of Paris palaces bring in grist to the mill afterwards from a business point of view?—Yes, I do.

744. Do you think it is worth our while to put up plaster of Paris palaces?—Well, I do not know; that wants further consideration. I am quite certain that it adds to the credit, and I believe it attracts business to the people who do it.

745. Still you would deprecate a considerable competition in the amount of money that should be spent upon those things?—Yes. I think it is a great pity that this state of things has come about.

746. There must be a limit to it?—Yes.

747. (*Sir Swire Smith.*) You have just alluded to the point that the Exhibition of 1851 was probably not considered an unmixed advantage; have you noticed yourself any evidence of any important industry in this country that has suffered in consequence of it?—I do not think I should like to say anything that would be put on record to that effect. I think I could mention some cases, but I am not sufficiently sure about it to justify me in doing so.

748. That is one of those things we are constantly hearing, but one does not often find much valuable evidence in proof of it. A man who sends his goods to an exhibition sends them because he wants to sell them, and if he sends a machine and it is copied by a manufacturer of some other country, then the user of that machine in England complains, and says that the English industry has suffered because that machine has been bought and copied by a foreigner. It would be interesting to know if there were really any evidence to show that?—It is really a difficult question.

749. (*Chairman.*) Do you agree with what Sir Swire Smith has suggested?—I do myself agree.

750. (*Sir Swire Smith.*) I think, from the general tone of your evidence, that you do not consider it would be desirable that this country should, so to say, push exhibitions?—No, I do not.

751. But that where an international exhibition is held in any country it is the duty of this country to exhibit there?—I think so, certainly.

752. And to make as good a show as any other nation is making, or as good a show as it can?—Yes, within reason. Beyond that, there ought to be some organisation for keeping an eye on the various small exhibitions, and deciding whether or no English exhibitors ought not to have an opportunity of showing at them.

753. In connection with the smaller exhibitions, say the provincial exhibitions in our own country, would you consider that the State, probably through its South Kensington Department, might do even more than it does in stimulating, say, applied art and objects that would tend to improve our manufactures in that direction?—I should hope if there was a permanent organisation that they would regard such exhibitions a little more benevolently. I do not think they ought to be subsidised or assisted with money in any way, but they might be helped by various Government Departments.

754. You have spoken of what you consider the importance of collective exhibits in the future. In my mind there is a considerable difficulty as to how these collective exhibits should be formed. Take silk as one illustration of the textiles; how would you form a collective exhibit of silk—from certain localities, or from firms, or from an open competition?—There are really two ways in which it might be done. You might go to a number of manufacturers and say, we are going to have a collective exhibit; will you take a stall in it, or a portion of it? Or you might go and say, we are

going to have a collective exhibit: Will you let us have some of your goods, which shall be labelled with your name, and they will be put along with all the other silk goods, and shown to the best advantage, but they will all be in the same show-case and all together? Or you might go to Macclesfield, or Coventry (if there is any silk industry now in Coventry) and say: Will you have a collective exhibit from Macclesfield or Coventry, and make it local?

755. My point is that by going to the firm and asking the firm to contribute, you might very easily have a great mass of similar things by different firms, and the space is always valuable, and as in the case of a collective display the cost would be borne probably by the State, it would be desirable that there should be some expert committee that should select. What have you to say to that?—You would want a committee of selection certainly.

756. That would really apply to every industry?—That applies to every industry.

758. Where you want to get the best that you can select, and where therefore it is not so much a question of firms as of goods, you would practically let it be open to all firms to send the best that they have, leaving this separate expert committee to make the selection from those?—Yes; but on the other hand you often get a manufacturer who is anxious to show on his own account, and you would have to provide for him, too.

758. Would you provide for him in the collective display if his goods were as good or better than those that were exhibited by others?—I think each case has to be considered separately. I do not think there would be any difficulty in arranging it. The idea of the collective exhibit is that people contribute merely their goods, and that they are all arranged into a harmonious collection of some sort.

759. The general trend is apparently towards collective displays?—The collective as opposed to the individual.

760. Therefore, that being settled, there wants to be some method of securing the best?—Certainly; and you must get a suitable committee to start with, or you might get the local Chamber of Commerce, or some organisation of that sort.

761. (*Chairman.*) Did you say the local Chamber of Commerce?—Yes; very often the local Chamber of Commerce could do it.

762. (*Sir Swire Smith.*) You would find, would you not, with regard to the exhibits from foreigners, that probably there would be a much greater desire on the part of foreigners to exhibit in England than, generally, there would be on the part of English makers to exhibit in a foreign country? I put it in this way, because every foreigner could send his goods to England free, and therefore has an open market, whereas any Englishman exhibiting his goods in a foreign country has to meet the tariff. Is there anything in that?—That I know nothing about. My opinion on that subject is not worth giving. Foreigners, I may say, have not shown any tendency to come to exhibit over here at the various minor exhibitions that have been held, and there have been a great many minor exhibitions held in this country of one sort or another, some more or less commercial speculations and other independent organisations.

763. Take the case of the aniline dyes. They showed rather strongly in Manchester, did they not?—I was not aware of that; but that, of course, was a special case.

764. I was rather surprised that you seemed to put art rather in a secondary position with regard to our exhibitions?—I did not mean that at all.

765. The exhibitions have been held, of course, for the promotion of commerce and industry?—Yes.

766. And therefore art rather takes a decorative or outside influence?—I think with regard to the practical value of exhibitions that art must certainly take a secondary place, that is, if you are regarding exhibitions merely as a means of promoting industry—at least, I ought not to say secondary, but it would be a separate place.

767. All the continental exhibitions have been always strongest in art and in industrial art, have they not?—Industrial art is another matter; I am referring to pure art.

768. We are considered to be weakest in art, especially in industrial art; but do you not think that fine art has such an influence upon industrial art that it cannot be too much promoted?—I think that is going rather a long way round. Really, I do not think that a gallery of pictures at an exhibition has any influence whatever upon industrial art; at least, I cannot see that it has any immediate influence, any more than an exhibition at the Royal Academy has, and I am not prepared to admit that at the present time we are weak in industrial art.

769. I should have thought it helped?—If it does, of course it would be in a very indirect way. I should like to say that I hope I have not given the committee the idea that I want to depreciate the importance of the art side of an exhibition, because nobody realises its importance more than I do. I have been merely dealing with its practical effect on industry.

770. (*Sir Isidore Spielmann.*) To continue on this question of art, is it not the fact that every international exhibition that is promoted is not solely an exhibition of industry, but its title invariably runs, "industry, science and art," and art forms quite as important a part of it as anything else?—Certainly it does, but not from the commercial point of view.

771. I suppose you are thinking of your experience in Chicago when you say that?—Chicago and Paris, both.

772. Which Paris Exhibition?—1889.

773. Since then the exhibitions have been less largely loan collections and much more of the nature of artists' exhibitions, have they not?—Yes.

774. Would you not say that at Chicago it was a loan exhibition?—For the most part, certainly.

775. And you had very few artists exhibiting on their own account?—There were many contributions from artists, but the bulk of it, and the best of it, was composed of loans.

776. And consequently very few sales?—There were not many sales.

777. But since then, are you aware that it has been quite the other way about?—No; I did not know it was as much as that.

778. Are you aware that there are very few private owners contributing now, and more and more artists?—No; but of course that is the right direction for it to take provided always you can get as good a representation of contemporary Art.

779. Are you aware that the sales have been large in comparatively recent exhibitions as compared with those to which you refer?—They would probably be.

780. Has any attempt ever been made by the Society of Arts to ascertain what are the direct results of exhibitions upon trade?—No.

781. Or to your knowledge by any chamber of commerce?—Not by anybody. No such inquiry has ever been made to my knowledge.

782. You have referred to Messrs. Doulton attributing their great success to their exhibition of pottery, I think, at Vienna?—Yes; I mentioned their name because I know that the late Sir Henry Doulton, whom I knew very well, attributed it to that exhibition.

783. Do you think there are other trades that have equally benefited in the same way?—Certainly there are, but I do not like to mention names.

784. Can you mention any trades besides pottery? I did mention furniture, and I might mention decorative glass and carriage building. I cannot call to mind any others, but I daresay that with a little thought I might think of some others.

785. With reference to a question that Mr. Wilson Fox put to you, do you not think our manufacturers have almost as much to learn from foreign manufacturers as they have to teach them at these international exhibitions?—Yes, but I do not think a modern exhibition is the place to learn it. I do not think that a manufacturer learns a very great deal by going to an international exhibition; I may be wrong, but I do not think he does.

786. You agree, I suppose, that if we do participate in international exhibitions, we ought to do it thoroughly?—Certainly, we ought to do it properly.

787. You said, I think, you thought about £100,000

Sir H. T. Wood.
30 Nov. 1906.

or £120,000 is a large sum for that purpose, and that that ought to do it well?—It varies so much under the different conditions, but, as a very rough statement that is what I thought. If you are going to exhibit in America, for instance, it is a great deal more costly than exhibiting in Paris, because it is further away, and freight and insurance are higher.

788. I think you said that at Chicago Germany had *carte blanche* to spend money?—That is what I was told, practically.

789. For how long has Germany been spending money lavishly on these exhibitions, do you know?—Chicago was the first large exhibition in which she took part, to the best of my recollection. She did not exhibit in the Paris Exhibitions in the seventies and eighties. I think Chicago was the first one, and that that was mainly the reason for the expenditure, because the Germans had never had an opportunity of taking part in a really big exhibition before, so they were all very keen about it.

790. Do you think that by Germany showing and participating so lavishly she injures this country? Do you think she takes orders at exhibitions to the detriment of our manufacturers?—I do not know, and I have no means of saying. That is a question which a manufacturer would be better able to answer. One cannot get at the results, you know.

791. Has it been noted at the Society of Arts that whereas Germany has been participating lavishly in all these International exhibitions, she never has one herself?—She has thought of having one, but has never had one. On two or three occasions there has been a movement for getting up an exhibition at Berlin, but it has never come to anything.

792. Has it been noted as a rather remarkable incident?—I have never heard the remark made.

793. With reference to your having failed at Chicago to form collective exhibits, do you think that was on account of the ignorance of the manufacturers to appreciate the advantages of the method?—No; I think it was trade jealousy.

794. Do you not think there was something in the novelty of the idea which did not appeal to the manufacturer?—Certainly. It has been rubbed into them since, and now they have realised the advantage that there is in it.

795. Do you agree that it will become more easy in future to form these collective exhibits?—Certainly I do, especially after we have had experience of them as we did at St. Louis.

(796. (*Chairman.*) Are there any points that have not been drawn from you by the questions round the table in regard to which you would like to say something to us?—There is one point, which is not a very important one, to which no reference has been made, and that is the amount of indirect Government support as shown by official exhibits by Government departments. Other countries, the French especially, owe a good deal in their sections to that. In any French section abroad there is always a fine show of Sèvres porcelain and Gobelins tapestry. The British Government departments have given very little help, although at some times they have given more than they have at others.

797. We have got no Sèvres porcelain which is being produced by any of our State departments?—No, but we have got the Post Office, and we have got the Army and Navy, and the Ordnance Survey and the Education Department. They all have exhibited at different times.

798. There have been Government exhibits, as you are aware, from the Labour Department, for instance, and the South Kensington exhibits of science and art?—Yes.

799. (*Mr. Wilson Fox.*) And a British Government exhibit has just gone to New Zealand, a considerable number of departments having joined in sending those exhibits?—As I said, they do on some occasions do more than on others.

800. (*Chairman.*) That is of late years, and perhaps it was not done so much in connection with the exhibitions in past years you were most familiar with; there were no Government exhibits as a rule then, were there?—Yes, at some; not many at Chicago, and none at Paris, 1889.

801. (*Mr. Wilson Fox.*) We have heard there is rather a reluctance on the part of British manufacturers to exhibit, and the evidence we have had, so far as I can understand it, is to the effect that in the last two large exhibitions manufacturers and traders have been asked to join mainly by circular. When an exhibition comes on, do you think that any more active steps can be taken to bring the matter before the manufacturers of the country in a more personal aspect?—It has not been left entirely to circular in the past; it has generally been the practice to organise town meetings in various parts of the country.

802. In connection with what exhibitions was that done?—For those exhibitions I have had to do with, we had meetings at Manchester, at Bradford, and at Dublin as well as in London (at the Mansion House); and I think all the Chambers of Commerce were asked if they would organise meetings, and that some did.

803. I only want to find out whether you think sufficient steps have been taken in the past to bring these matters before the manufacturers, having regard to their disinclination to show?—I think so. I think everybody had an opportunity of knowing about each exhibition.

804. Do you think that everything that could be done has been done in that direction?—Yes, I do.

Sir ISIDORE SPIELMANN, a Member of the Committee, further examined.

Sir J. Spielmann

805. (*Chairman.*) I think you have some further information to lay before the Committee in reference to the Royal Pavilion at the Paris Exhibition, 1900?—Yes. In continuation of my evidence respecting the Royal Pavilion I wish to lay before the Committee this panoramic view. (*Handing in and explaining same.*) It shows the pavilions of the various countries in the Rue des Nations at the Paris Exhibition, each pavilion representing the headquarters of the country the name of which you see marked below the illustration. This is, in fact, the copy of a photograph. *This* is the pavilion of Great Britain. You will note it is one of the smallest in the entire row of pavilions. As a contrast I want you to note the pavilion of Belgium, which stands next to it, but covering, I suppose, something like twice the area, because it ran back a very long way; and I suppose, as regards cubic contents, it represents twice or three times the amount. Our pavilion cost £22,000 at least, and was constructed of steel girders with outside decoration. It was a copy of a Jacobean house at Bradford-on-Avon—Kingston House. Please compare this much more decorative pavilion of Belgium, which cost, furnished complete, the sum of 388,000 francs—that is, £15,500. It is a larger edifice, more decorative and much more suited to exhibition purposes. It is very much cheaper, when you consider that the contents of our pavilion were mostly exhibits, the various rooms being provided by such firms as Gillow, Warings (they were not then amalgamated), and similar firms. The figure that I have just given you comes from the architect of the Belgian pavilion. I have not yet received the replies to questions I have asked about other pavilions, but I think I can safely say that, as a rule, they cost just about half, or even less than half the amount we spent on our very much smaller pavilion.

806. (*Mr. Wilson Fox.*) In whose hands was the decision as to the design and the cost of our pavilion?—I think the Executive Committee of the Royal Commission decided that it should be a copy of the Jacobean house to which I have referred.

807. Do you think that they allotted any specific sum for the building of it, or did they let somebody build it regardless of cost?—The Royal Pavilion Committee, to whom the details were left, were given by the Finance Committee the sum which they thought would be required, and the firm of Lucas and Aird undertook to build it at cost price.

808. (*Mr. Malcolm Ramsay.*) The Italian pavilion is about the biggest; at any rate its frontage is very great; have you got its cost?—I have not the cost of the Italian pavilion. The photograph will give you an idea of its comparative size and importance.

809. (*Chairman.*) That Jacobean house was a beautiful building?—Yes, it was.

810. (*Mr. Algernon Law.*) From the photograph it does not look so beautiful as it really must have been; the roof, as one sees, rather spoils it in comparison with the others?—Though in itself it was regarded as a most interesting copy of a Jacobean house, yet it was thought by many that for exhibition purposes we required something more ornate and something very much cheaper. At the termination of the exhibition this building was, I think, sold to Messrs. Lucas and Aird for the sum of £200.

811. (*Chairman.*) The same price as the St. Louis pavilion?—Yes; and the Commission seemed satisfied that no charge was made for pulling it down. These other pavilions were built so much more cheaply that when they removed the main supports the whole thing would collapse, and there was very little to pull down; they were supposed to last but two years.

812. (*Mr. Wilson Fox.*) Ours would have lasted much longer, I should suppose?—Ours would have lasted for 50 or 60 years. *Sir I. Spielmann.* 30 Nov. 1906.

813. (*Chairman.*) There was no object in its being made to last for such a long time as 50 years, was there?—No. When it was pulled down it was removed to Hull, where, I believe, Messrs. Lucas and Aird made it their offices in constructing the Hull Docks. It was re-erected there.

814. I think you have no figures at present showing the cost of other pavilions?—No. I was hoping to have received the particulars of the cost of other pavilions, but they have not come; the one from Belgium is the only one. I have here also, which I hand in, separate photographs of the different pavilions.

Sir Boverton Redwood, called and examined

815. (*Chairman.*) I think I need hardly ask you, but in order to get it on our notes, you have been very closely and eminently connected with your subject, chemistry, for a great number of years, have you not?—With the subject of chemistry for the past 35 years, and with special exhibition work for the past 22 years. *Sir B. Redwood*

816. You have prepared a statement in a form which apparently you would like to read to us?—With your permission, I would like to read the answers which I have prepared to the general list of questions which the Committee has sent out as a preliminary to answering any further questions which you, or any other members of the Committee, may think fit to put to me.

817. I think that would be most convenient. Will you please proceed?—I have numbered my answers in accordance with the numbers of the questions which you have sent to me:—

(1) I have been closely connected with exhibition work from time to time during the past 22 years.

I was a member of the General Committee of the International Health Exhibition in London in 1884, and a member of the Committee of Advice of the International Inventions Exhibition in the following year, and was largely consulted in regard to the organisation of certain of the exhibits at these exhibitions by the late Sir Frederick Abel, who was a member of the Executive Council of both. I also served on juries at these exhibitions, and, in addition, was joint reporter, with the late Dr. C. Meymott Tidy, of the International Jury on Solid, Liquid, and Gaseous Illuminants at the former exhibition.

I assisted in the organisation of the some of the exhibits at the Brussels Exhibition in 1897, and was President of the International Jury for Lighting Appliances and Materials at that exhibition; I was also a member of one of the juries at the Paris Exhibition in 1900.

I was a member of the Royal Commission for the St. Louis International Exhibition of 1904, a member of the Liberal Arts Committee, and as Chairman of the Sub-Committee for Group 23 I took a prominent part in the organising of the British exhibit illustrating Chemical and Pharmaceutical Arts.

I am a member of the British Commission for the Milan International Exhibition of 1906, and a member of the Juries Committee. I am also a member of the Committee of the forthcoming Franco-British Exhibition of 1908.

(2) I am of opinion that the effect of International Exhibitions has on the whole been:—

(*a*) To improve the manufacturing and export trades of this country;

(*b*) To encourage British Arts;

(*c*) To bring about better general commercial relations between the countries concerned.

(3) In my opinion, the particular industries which have chiefly benefited by exhibitions are those concerned in the production of manufactured substances and articles, and I consider that these industries have benefited through the exceptional opportunities thus afforded to the manufacturer to compare his own position with those of competitors among his compatriots, and especially the relative positions and importance of his particular industry in his own country and abroad. He is thus enabled to ascertain whether he is improving his position, maintaining his ground, or being displaced by others; also whether the particular industry in which he is interested is endangered by the more successful conduct and development of it in some foreign country. If sufficiently studious and observant, he may also have new light thrown upon his work, leading to important improvements in processes, with corresponding increase in the value of the products, and may, moreover, be led to discover fresh sources of supply of his raw materials, and novel applications of his products. Through the knowledge thus gained, and the inspiration thus received, the manufacturer's position is strengthened and safeguarded. He may be enabled to extend his business, or at any rate, to maintain a position which, otherwise, he might have lost, and at the worst he will be far better prepared to meet competition than if he had remained in ignorance of the achievements of others.

(4) I have no knowledge of any industry or classes of industry having been adversely affected by exhibitions. It is, of course, conceivable that such an opportunity for comparison of the similar manufactures of various countries may result in injury to a particular industry in one country and corresponding benefit to the same industry in another country, if buyers are thereby led to think that they are not purchasing in the best market, as regards either quality or price; but, assuming such injury to be done, it is probable that the result would have equally accrued either from abstention from exhibiting on the part of those engaged in the industry so injured, or still more from ineffective participation in the industry. As an illustration of the effect of abstention or ineffective participation, I may here refer to the remark I made when presiding at a meeting of the Society of Arts on the occasion of the reading of a paper on the St. Louis Exhibition by Mr. Walter F. Reid, in December, 1904. Speaking of the chemical exhibit at that exhibition, I said that the comparatively unsatisfactory character of the British chemical exhibits at previous exhibitions had unquestionably furnished ground for a contemptuous attitude of mind of foreign exhibitors towards this country, the belief being thus created that certain British industries were in a state of decadence, the true cause, viz., British apathy, being overlooked. I added that the character of the exhibits and of the awards in the British chemical section at St. Louis had removed that erroneous impression in respect of one industry, and had conclusively demonstrated that Great Britain could still venture to put herself in comparison with other countries as possessing exceptional advantages in the conduct and development of the industry in question, for Great Britain had shown the world that even with such a formidable competitor as Germany she could hold her own.

It is also conceivable that in certain cases rival manufacturers in other countries may have learned useful and profitable lessons from the exhibits of a particular country, and have applied these in such manner as to secure a pre-eminence they could not previously claim, but in this matter all have had equal chances of benefiting, and the success of those who have made best use of their opportunities surely cannot be grudged.

Sir B. Redwood.

30 Nov. 1906.

(5) I certainly consider that the direct commercial results obtained by the official participation of this country in international exhibitions have been such as to warrant His Majesty's Government in giving grants for the organisation of British exhibits in future.

I am well aware, as I said on the occasion to which I have alluded, that the prevailing tendency is for manufacturers to regard such exhibitions as evils, but I am of opinion that if they are, in any sense, evils, they should unquestionably be regarded as necessary evils, and if that be conceded it follows that this country should participate in them. It further follows that the participation must be full and complete, for half-hearted, reluctant action may easily become worse than abstention.

I consider that abstention is self-effacement, and ineffective participation a clumsy attempt at suicide.

Without an adequate grant, effective participation has, in the case of this country at any rate, been shown to be impossible of attainment, and the justification for the giving of an adequate grant is that the benefit to a particular industry resulting from participation in an international exhibition is a benefit to the nation, to the whole community, to all those engaged in that industry, and not alone to the exhibitors.

(6) In the light of my experience I am convinced that if participation in international exhibitions were left to private enterprise the results would be most unsatisfactory. Referring again to the chemical exhibit at St. Louis, I know that if it had not been for the liberal grant (£12,500) made by the Royal Commission towards the expenses of this exhibit, nearly all the more important of the firms who participated would have declined to do so. The grant (the whole of which was not expended, the actual expenditure being £10,187 3s. 3d.) enabled us to organise a series of exhibits on a modified "collective" basis, and in respect of these the cost of transportation, installation and insurance was borne by the Royal Commission. In the words of the report of the Finance Committee: "If this arrangement had not been adopted the British section would have been small, as few manufacturers were willing to incur the cost of sending goods for exhibition to the United States, where the high protective tariff restricts imports from foreign countries." It may be urged that if the exhibition were held in a country where the disability referred to does not exist, manufacturers would have been willing to incur the whole of the expense, but I do not think that even in those circumstances such an exhibit as the British chemical exhibit at St. Louis could have been obtained without a substantial subsidy. Even with that strong inducement, the co-operation of the more important firms was only obtained through the personal influence of the members of the sub-committee.

(7) I do not think that experience has shown the need for attaching any special conditions to a grant of public money for the organisation of official exhibits, and as long as the administration of the grant is placed in the hands of such men as those who have been members of International Exhibition Commissions I am not apprehensive of such need ever arising. I am sure that as regards the St. Louis Exhibition, if the Liberal Arts Committee had found that the accommodation and facilities offered by the exhibition authorities were not adequate, or that a creditable representation of the British Liberal Arts could not be secured, the money placed at the disposal of the Committee would not have been expended.

(8) Perhaps the best answer I can give to this question is to state briefly the method employed in the organising of the British exhibit of chemical and pharmaceutical arts.

A sub-committee of the Liberal Arts Committee having been appointed, invitations to participate in the formation of an exhibit which collectively should be representative of the chemical and pharmaceutical industries of this country were issued to a large number of carefully selected firms. Without the intimate personal knowledge of the industries possessed by the members of the sub-committee it would have been impossible to make the necessary preliminary selection of the firms to be invited; and it is obvious that the success of such a representative exhibit as was aimed at is primarily dependent upon the judicious selection of the participants. There must be, in the first instance, a representation of the various branches of the industry proportionate to the relative importance of the branches; and in the second place a due recognition of the relative positions of the different manufacturers. In this connection it may be remarked that not infrequently those whose co-operation is most desired are, for obvious reasons, the least willing to accept the invitation.

The next step was to follow up the invitations issued by a personal appeal to those who had received them. The members of the sub-committee individually and collectively devoted themselves to this laborious and thankless task, being largely aided by facilities for so doing afforded them by the Society of Chemical Industry.

From June, 1903, till June, 1904, the sub-committee met regularly once a week, the meetings usually lasting several hours; and throughout the whole of this period the correspondence entailed considerable labour.

It was not until the sub-committee had obtained such promises of support from the leading representatives of British chemical industries as assured the success of this branch of the Liberal Arts section that they applied for a grant to defray the expenses.

Strong exception had in the past been taken in this country to the practice of forming collective exhibits, which had long been carried out by some other countries; and, to meet this objection, the sub-committee devised a scheme of modified collectivity, based upon the grouping of the exhibits, without the suppression of individuality, to which there had been strong opposition. This scheme was found to work admirably—to facilitate the study of the exhibits, and to add largely to their educational value. In carrying it out, it was found that, in preparing the exhibits in this new form, there was no less need for the exercise of independent thought on the part of the exhibitor, or less opportunity for the display of individuality and originality, and the exhibitors, in responding to the appeal, aimed with conspicuous success at furnishing an instructive series of illustrative specimens, as well as the ordinary selection of commercial products. It is, however, essential to success in carrying out this principle that the organising committee should not merely be conversant with the industries to be represented, but also should have full knowledge of the firms engaged in those industries. The primary object must be the national one of demonstrating what any particular branch of British industry is doing, or could do, in comparison with what is being accomplished by other countries; and everything, therefore, depends upon the judicious selection of the exhibiting firms.

The nucleus of an exhibit having been secured, the sub-committee then proceeded to enlist the co-operation of prominent men of science, universities, and technical colleges, with the result that a considerable number of exhibits of high scientific importance and historical interest were obtained. And finally they created a new departure by obtaining a replica of the low-temperature apparatus employed by Sir James Dewar in his investigations at the Royal Institution. This apparatus was successfully worked throughout the whole period of the Exhibition, under the direction of Mr. J. E. Petavel, of the University, Manchester, who gave periodical lectures and public demonstrations on the effect of low temperatures on the physical properties of matter. The apparatus was, at the close of the Exhibition, purchased from the Royal Commission by the Bureau of Standards of the United States Government, and is now installed at Washington.

It should be added that an important part of the work of the sub-committee consisted in the preparation of an unusually comprehensive descriptive catalogue of the exhibits, which was issued as a separate volume of 181 pages. This catalogue was, on the recommendation of Dr. Keiser, professor of chemistry at the Washington University, adopted as a text-book for the use of advanced students of technology in that institution.

It should further be added that the sub-committee took steps to furnish the British representatives on the International Jury with very full particulars of the various exhibits, in order that these representatives might make known the special features of the exhibits to their colleagues.

(9) In reply to the ninth question, I can only state generally that, according to my experience, Continental nations have exhibited a more paternal attitude towards exhibitors than we have, and have in many instances insisted upon the adoption of a strict system

of collectivity in which individuality has been completely suppressed. This, as already indicated, is strongly objected to by British exhibitors.

(10) Apart from such causes of success or failure as are indicated, more or less definitely, in the answers already given, I am of opinion that failure, or partial failure, of British exhibits in the past, as measured by the awards of the juries, has been partly due to negligence on the part of exhibitors in taking the necessary steps to bring their exhibits effectively under the notice of the jurors. As a juror, I have often been struck by the contrast between the British and foreign exhibitors in this respect. The former have left too much to chance, and have often been absent when the jury inspection was arranged to be made, or have been represented by persons unable to explain the exhibits or to intelligently answer questions put by the jurors. The remedies for these defects are obvious.

(11) My answer to Question 9 to some extent answers this question, and I can only add that I am very doubtful whether any attempt to introduce Continental practice in this country would be successful.

(12) There is, no doubt, much to be said in favour of the appointment of a Royal Commission for the purpose. Such an appointment confers a prestige which is itself an important factor in promoting the success of a British section of an International Exhibition, and, as already mentioned, affords a guarantee that any money granted will be wisely and honestly expended. In my opinion, the chief objection to a Royal Commission is the very serious delay in commencing work which its appointment usually entails. There is naturally keen competition for space as well as for the best positions, and prompt action is very necessary. Usually it happens that long before we have decided upon participation the best portions of the available area have been secured by other nations. If there were some permanent organisation competent to accept the invitation of the exhibition authorities without delay we should at any rate have a fair start in the race. Apart from this, such an organisation would be able at once to apply the knowledge and experience of procedure already gained, and continuity of policy would be assured. I have long considered that some form of permanent organisation should be created, and I strongly recommended it at the meeting of the Society of Arts, to which I have already alluded.

818. (*Chairman.*) I understand that your story, which has been a very interesting one, refers entirely to the chemical exhibit at St. Louis?—Substantially that is so, but I may say that I have incidentally considered in the evidence which I have given the experience I have had in organising and judging other exhibits, including those relating to appliances and materials for lighting and heating.

819. Your exhibit at St. Louis was a very successful one, I believe?—At St. Louis we had, I think, reason to congratulate ourselves upon the result we obtained.

820. Do you know of any direct results to trade from that successful exhibit?—I can only state generally that the exhibitors in many instances have told me that they were glad that they had been induced through the pressure which my committee put upon them to participate in the exhibition. And I understood their remark to mean that they felt they had derived substantial commercial advantage from that participation.

821. But do you not know of any actual transactions in consequence, I take it?—I do not know of any specific transactions, nor do I even know that I am absolutely justified in putting the construction upon their remarks that I have already given you.

822. Still, the exhibitors said they were pleased with the result?—Yes, in several instances the more important of the exhibitors said they were very pleased. They had been most reluctant, as I knew, to participate, but they were very glad that they had been led to do so.

823. There is one branch of the chemical trade that has been very much spoken of, although here I must speak like the man in the street. I am thinking of the coal tar dye question. Was that affected at all by your exhibit?—I think that evidence was afforded that although the bulk of that industry has unfortunately gone to Germany, in certain branches we are still carrying on a profitable business.

824. What special parts of the chemical industry were shown to be satisfactory in this country and better than those of Germany, say, or any other country?—I think we may say that of what are known as inorganic chemicals generally, such as alkali, sulphuric and nitric acids, alum and cyanides; also soap and candles. On the other hand, organic synthetical products unquestionably were shown to greater advantage by other nations, and particularly by Germany.

Sir B. Redwood.

30 Nov. 1906.

825. You speak, in answer to Question 5, about the justification for the giving of an adequate grant, would that mean paying the whole expenses of the exhibitor?—It means paying the expenses which were arranged to be paid in respect of collective exhibits by the St. Louis Commission; that is, the cost of transportation, providing show-cases, insurance, and naturally, under the head of transportation, the return of the goods to those who sent them. But that by no means covers the whole cost. The successful organising of an exhibit by any individual manufacturer demands a great deal of time and thought and labour, for which no recompense whatever was given to him by the Royal Commission.

826. In your answer to Question 8 you speak of a system of modified collectivity; would you explain a little more to me what modified collectivity means?—The system to which I have given that name differs from the Continental collective system in the following way:—Instead of, as on the Continent, the products of a large number of manufacturers of a particular class of goods being all merged in one general group in one large show-case, without any indication being afforded to the public as to who contributed them, we found that we could achieve what we believed was the most desirable aim of collectivity without doing that which was objected to by our manufacturers, by grouping the different classes of exhibits in a series of octagonal cases, so that they were all put together, but they were not so merged in one whole as to suppress the individuality of those who contributed them.

827. You mean to say that you kept the names?—We retained the names, but we grouped the different exhibits. Therefore, anyone desirous of studying, for instance, the exhibits of alkali, would find the whole of them grouped together in one or other division of an octagonal show-case, and he would see in addition who had contributed the specimens which were selected by the committee in order to give a representation of the best that this country was capable of doing. The difference between the two systems, therefore, is that on the Continental basis the name is not given, and the whole of the samples or specimens are put together in such fashion that no one can tell which particular firm contributed any individual sample; whereas, in our case we grouped them together, but without suppression of the name, and therefore anyone could tell at once who contributed any particular specimen.

828. There is a point about the awards on which I should like your opinion. Do you attach importance to the prizes at an exhibition?—I say distinctly that the retention of the name, the maintenance of the individuality of the exhibitor, which I have just alluded to, necessarily includes the retention of the system of awards. I know that there would be quite as serious an objection on the part of manufacturers in this country to any alteration of the system of awards involving discontinuance of prize-giving as there undoubtedly is to the suppression of their names in respect of collective exhibits. I am quite clear that it would be hopeless to suppress them. I would never think myself of undertaking to participate in any attempt to get up a representative exhibit unless I were able to say to the exhibitor, you shall have such award as your exhibit merits. That is, after all, one of the most potent arguments that we can use with the exhibitor.

829. Is confidence felt in the way in which these awards are made, do you think?—I think if you take a case that we have just been discussing, the case of the St. Louis Exhibition, it must be admitted that the judgment of such an international jury as that which dealt with the exhibits there was a really valuable piece of evidence as to the position of the manufacturer in respect of the quality of his products.

830. Going now to quite a different subject, did you see the British pavilion at the St. Louis Exhibition?—No, I did not.

Sir B. Redwood.

30 Nov. 1906.

831. Then probably you did not go to St. Louis?—No, I was not at St. Louis.

832. Perhaps you may have heard from some other people whether they attached importance to that fine palace there which constituted the pavilion of the British section?—I would say in respect of that question, as I would in respect of the question of participation generally, that anything which tends to put us at a disadvantage in the estimation of people whose opinions may have weight, seems to me to be objectionable; and if other nations are in the habit of having an imposing headquarters I think certainly that this country ought to have something of the same kind.

833. I suppose that some consideration would also apply to the hospitality exercised in the pavilion, that is to say, we ought to do the same as other countries?—I think that it makes for success on the whole.

834. (*Sir Isidore Spielmann.*) With reference to the success that you achieved in your chemical exhibit, do you think that if an equal amount of energy had been displayed by other committees similar success would have been obtained by them?—I cannot see any reason why it should not have been. I do not think that we were so situated as to have any exceptional advantages in making an appeal to those who contributed.

835. You did not secure the firms represented in your collective exhibit by circular, but you made personal effort perhaps?—I think it has been long demonstrated that the issue of circular letters is absolutely useless. I know that most firms are in the habit of ignoring an application of that kind. We had, I may say incidentally, an illustration of it in the circumstance that in respect of the St. Louis Exhibition, before the Royal Commission was formed, and when we had simply a Committee appointed for the purpose of organising the British section of the Exhibition, there were a large number of circulars issued to members of the chemical manufacturing trade, many of whom subsequently took part in our collective exhibit. I do not think that we had as much as 1 per cent. of replies to those circular-letters, and the replies that we did get were of the most indefinite character—most disappointing in fact, that is to say, they were disappointing to those who had not had experience of the futility of an attempt of that kind in the past. I had, and I attached no importance whatever to the circumstance that it was reported that to this large number of circulars which had been issued there had practically been no satisfactory replies received.

836. How did you obtain your exhibitors?—In the first place by writing personal letters which were signed, all of them, by one or other member of my Sub-Committee, and then following up those letters very promptly by a personal appeal, usually a personal visit, and exhibiting what I am afraid was regarded as very objectionable perseverance until we succeeded in achieving our object.

837. If other committees representing other industries took the same amount of trouble, do you think the same success might have attended their efforts as regards other collective exhibits?—I cannot see why it should not have done so.

838. With reference to the question of awards, your collective exhibit took a large number, I believe?—Yes, a very large proportion.

839. Have you any reason to think that they were not correctly bestowed? I ask the question because we have heard from another witness that awards given at these international exhibitions are not always thought to be honestly given by the international jury?—I have never heard such a suggestion made in relation to the awards in the particular section I was interested in. But I may say this—there are no keener critics of the action of an international jury in a matter of that kind than the exhibitors who have not themselves received as high an award as some others. We should certainly have had, and it would certainly have come to my knowledge if we had, most serious complaints on the part of some of the exhibitors if there had been any ground for such a suggestion as appears to have come to your knowledge. I must confess that I think such a suggestion must be absolutely baseless. I believe myself that the awards were in all instances thoroughly deserved and most honestly made, and I believe that the report of that particular international jury in relation to chemical products is a document which will bear the keenest investigation from that point of view.

840. We have heard also from another witness that difficulties sometimes exist between manufacturers and their agents, owing to the fact that the agent will not allow the manufacturer to exhibit; have you had any experience of that?—I do not think there is any foundation for such a suggestion. It has been a very common experience with me when I have approached a manufacturer with the object of getting him to exhibit in a foreign country that he has said, "I have agents there, and you know that one must be very careful that one does not offend one's agents; in any case I could not give you an answer off-hand, but if you press it, of course, I must consult my agents, and I am inclined to think that probably they would object." That remark has been made to me in many cases in which I have ultimately succeeded in getting the support and participation of that particular manufacturer; and I do not look upon it as anything more than a stock phrase or objection. Most of those manufacturers that one specially wants to get object in the first instance as a matter of principle to saying yes, and sometimes they give one excuse, sometimes another. I believe the reference to the agent in ninety-nine cases out of a hundred, or at any rate, in the great majority of cases, is simply an excuse.

841. With reference to another objection, that of copying exhibits, do you think any of your exhibitors have lost by having shown, say, in competition with Germany?—I know that there is a very common impression among exhibitors which I put down to insular ignorance, that we have everything to lose and the foreigner everything to gain from participation in exhibitions, and so affording the foreigner the opportunity of examining our goods; and that, on the other hand, we have nothing to learn from examining the goods exhibited by the foreigner. But I think that is a mistaken impression which is very rapidly becoming removed. There, no doubt, are some old-fashioned people who still think that England can do anything that any other nation can do, and usually do it a good deal better, and that if we place our goods on show in another country we may be affording to its people an opportunity of imitating which otherwise they would not have. If you take the case of a machine, it is quite evident that if a foreign firm wants to manufacture an imitation of some successful machine that we have, they do not depend upon the showing of that machine at an exhibition. It is perfectly easy, of course, for them to get one of these machines and copy it. It seems to me, therefore, that there can be no ground for the fear that by taking part in an international exhibition abroad we are affording to rival manufacturers the opportunity of taking some advantage of us.

842. (*Mr. Malcolm Ramsay.*) With regard to your answer to question 3, is it your opinion that different trades have benefited in very different degrees by the participation in exhibitions?—I think they have, and I would suggest that the variation in the extent to which different industries have benefited has been very largely the outcome of differences in the extent to which those engaged in the industry have taken advantage of the opportunities afforded to them.

843. Then you put it down rather to personal grounds than to essential differences in the character of the trade?—I think it is mainly personal.

844. In fact, some are energetic and some are not?—Precisely.

845. In that same answer you speak of enabling the manufacturer to compare his position with those of competitors among his compatriots. Do you hold that it is the duty of the Government to enable the manufacturer to do that, or should he not be left to keep an eye on his fellows and stand his chance in the competition?—My feeling is that this is a unique opportunity of enabling the manufacturer to do that, and that this unique opportunity cannot be furnished without the financial support of the Government. Therefore, I look upon it as most justifiable that there should be a State subsidy of an organisation which affords this unique opportunity.

846. Assuming that, do you think the Government is bound to do more than provide the organisation, and then let the individual manufacturers bear their share of the cost of the exhibit?—I do think so.

847. The Government, having provided the general and secured uniformity, could not the manufacturers pay their share of the expenses after that?—In the first place, looking to the circumstance that in my view the benefit is national—is a benefit, that is, to everybody in the nation, and not alone a benefit to the manufacturer—I think that there is good justification for going further than the giving of such a grant as would simply provide the machinery and leave the individual exhibitors to take advantage of that. I think there is good reason for subsidising the exhibition to a further extent than the mere grant of the necessary facilities. In the second place, I say, in the light of my knowledge and experience, that the British manufacturer never would take advantage of this opportunity if it were left entirely to his own initiative, and he were called upon to defray the expenses. He would probably argue, as I have just indicated, that it was not only going to do good to him to exhibit alkalis. He would say: "Why should I shoulder this burden when there are a number of competitors of mine engaged in the trade who will equally benefit from the advertisement thus given and the position that this country will thus be assisted to maintain in the great alkali industry? Therefore I am not disposed to shoulder this burden, unless you can prove to me that the Government are going to give me not merely the opportunity of showing, but assistance in defraying some, at any rate, of the expenses that I shall incur if I participate."

848. Then you regard participation in an exhibition rather as a general advertisement of the trade of the country than as an effort to help the individual to push his own goods?—I do.

849. And that is the justification on which we give grants?—That is my view.

850. In your answer to the same question, No. 3, you speak of the advantages which the manufacturer may obtain from exhibitions if he is sufficiently studious and observant. That does not necessarily imply official participation, does it? I suppose the manufacturer who is studious and observant can go to an exhibition abroad and notice what is there, whether there is an officially organised British section or not?—No doubt he can, if you do not take into consideration what to some extent I had in my mind, and that is the importance of being able to compare what this country is doing, as shown in the British exhibit, with what other countries are doing. It would detract very much from the value of the object-lesson to a British manufacturer, not an exhibitor, if he went to an international exhibition abroad and simply saw exhibits of goods in his own particular industry made by other foreign countries. It is the circumstance that he is able to compare the British exhibits with the foreign exhibits which renders the opportunity uniquely advantageous to him.

851. Then would you consider that the British manufacturer—I am speaking of the good manufacturer—is not sufficiently informed of the general conditions of the trade in his country to be able to compare them with the foreign products, unless he has side by side with the foreign products his own samples?—Undoubtedly many of them are not.

852. In your answer to our sixth question you say: "I am convinced that if participation in international exhibitions were left to private enterprise the results would be most unsatisfactory." Do you also hold that opinion from the point of view of the individual exhibitor? I mean, do you think that a single merchant gets a better advertisement out of official participation in an exhibition than he would get by employing his own traveller and pushing his particular lines in his own private ways?—What I had mainly in my mind in making that reply was the general effect.

853. I took the passage to mean that, but I am putting to you the counterpart from the point of view of the individual. Is it for the individual a better advertisement to join in a collective exhibit than to employ his own travellers and send them where he likes?—I think in respect of the individual exhibitor that his own particular interest is best served by making as good a display as possible of the industry in which he takes part. I believe that to some extent he derives benefit from the reflected lustre of others. If he, for the sake of argument, not being in the forefront of the manufacturers of a particular article, were showing that particular article, but not in company with others who were making the same thing better and had a higher reputation for it, I do not think that he would derive as great an advantage as he would by showing in company with others, some of whom might be exhibiting that same article in a better form. I base that opinion upon this, that there are two considerations with the foreign buyer in respect of any particular class of goods—first of all there is the general reputation of the country in respect of these goods, and then there is the reputation of the individual in respect of the supply. Unless this country, therefore, makes a creditable general display and leads the foreign buyer to see that she is thoroughly holding her own in respect of the manufacture of a particular class of goods, I think that any individual manufacturer in that particular industry would be placed at a disadvantage.

Sir B. Redwood.

30 Nov. 1906.

854. To take an illustration, do you think that, say, a manufacturer of agricultural machinery would advertise his goods better by sending them over to an exhibition at Chicago, or by sending travellers around Canada? That is the point I had in my mind?—I am afraid I cannot answer that question at all definitely. It appears to me to embrace a number of considerations, but speaking generally I think that the answer which I have attempted already to frame will apply to the case of the agricultural implement; that is to say, if this country had not—we know that she has, in common with America, of course—a high reputation for the manufacture of agricultural implements, and if she did not take steps to maintain that high reputation, I think that the individual manufacturer of a plough, for instance, would find himself placed at a disadvantage. People might say, "Well, it may be that Mr. Jones or Mr. Brown is still making a good plough, but don't go to England for any agricultural implement, because they have dropped out of it, and their place has been taken by the United States, who have manufactured something which is far lighter and far more effective." So that it does appear to me, with submission, that the general view which I have attempted to enunciate covers a case of that kind.

855. In fact, you cannot really separate the general from the particular?—I am afraid not.

856. Your view, I understand, is that to participate successfully in exhibitions we must have collective exhibits in some form?—In what I term a modified form.

857. Do you think that we could possibly succeed in getting this system adopted in England, so as to make our participation in any given foreign exhibition really representative of the characteristic trades of the country?—I do not want to be egotistical in my reply, but I venture to think that we did succeed in doing that in the case of the chemical exhibits at St. Louis; and, as I have already said in answer to Sir Isidore Spielmann, I do not see why other groups should not have been organised equally effectively.

858. Would it not have been a very expensive business to get a really complete representation.—No doubt it would have involved a somewhat larger expenditure than was incurred in connection with St. Louis, taking the illustration of the cost of the chemical exhibits. It seems evident that a few thousand pounds more would have been needed to be spent.

859. Turning to your point as regards copying particular machines, I think you said that if a foreign rival wished to copy the goods of a British manufacturer he could always get a sample machine from the manufacturer at home and then copy it abroad?—Yes.

860. But I suppose it is more easy for him to do so at an exhibition, because he has a greater variety of machines under his eyes, and can thus find out where to go to find the particular one which is most suited for his own purposes?—I think it may be helpful to him in enabling him to decide which is the best particular form to copy; but I do not think that he could successfully copy a machine with the opportunities afforded for that at an exhibition. I have a good deal of experience of what has taken place in the automobile industry, for instance.

861. My only point was that at an exhibition he would have a greater selection to choose from?—Yes, that is so; but it only carries him to the point, in my judgment, of deciding which machine he would like to copy, and it does not enable him to copy it. As in the case of the automobile, as has been done over and over again by various countries in copying the success-

Sir B. Redwood.

30 Nov. 1906.

ful machines of others, he has to get one of the machines and pull it to pieces and make a very minute study of it, such as he could not possibly make at an exhibition, before he is in a position effectively to make a copy.

862. Turning to another point, did the individuals who came into your collective chemical exhibit at St. Louis employ their own agents, or did you supply agents?—We allowed the exhibitor a perfectly free hand in the appointment of a representative at St. Louis, but we were quite independent of anything that the paid representative of an exhibitor might say or do in respect of the furnishing of information in regard to the exhibits individually or collectively.

863. Did the exhibitors employ and pay their own representatives?—In some instances, but not in many. They were in most instances so satisfied with the arrangement which we adopted—that was to engage a competent staff first of all to instal the exhibits there, and then to give information in regard to them—that they left themselves entirely in our hands.

864. Then some of them were left entirely to you?—We gave them, as I have said, their choice of action. We gave them a free hand, and some did have representatives of their own, but comparatively few.

865. (*Mr. Harris.*) May I press you a little further on the relation of exhibitions to British trade? You evidently have a high opinion of their educational effect upon the British trader. Do you not think that the real existence of such an effect is quite inconsistent with the admitted reluctance of the British trader to take part in these exhibitions?—No, I do not think it is. And I do not think so for this reason—that I find among manufacturers a similar failure to appreciate advantages in respect, for instance, to research work. If you compare the position of the British chemical manufacturer with that of the German chemical manufacturer, you will find that the British manufacturer does not equally believe in the result to be obtained by such investigations as can alone be carried out by what is called research work; and he is often in that way distanced by his Continental rivals, who do appreciate the very great importance of investigations such as I have alluded to. That, of course, is only a form of education; and, as the manufacturer in this country largely fails to appreciate the importance of educating himself by research work, so it does not surprise me in the slightest degree that he fails to appreciate the importance of gaining the knowledge that he can obtain from participation in exhibitions. In many instances the manufacturer, after he has been driven into participation, admits that he has derived these advantages; and it is because I have had admissions of that kind made to me that I speak as strongly as I do.

866. Do you think that if he realised this the British manufacturer would in future rush into exhibitions more than he has done in the past?—No; I do not think that he will, and my reasons have been already given.

867. Do you not think—when you explain how, after much importunity, you get the British manufacturer to come in—he comes in not so much because he really thinks he will get any good by it, but because he feels that he must really do something for the good of the nation, and so forth, and on broad general grounds of patriotism?—No doubt there are some who are actuated by feelings of that kind in coming in, and who remain in that frame of mind. But I consider they are in the minority among the thinking members of the industry represented.

868. You referred a short time ago to the failure of British exhibitors. Did you mean that positively, or were you using the word simply relatively to foreign exhibitors?—I had in my mind wholly the form of the question on which I based the reply. I was asked to what the failure of the British exhibitors might be held to be due. I was taking the failure for granted, and assuming that there was some ground known to the Committee which had led them to put that question. Personally, I may say that I have never known of any case of absolute failure in the sense of there being any case in which we have not derived some advantage. But I do know that, in a great many instances, the advantage which has been derived, as measured by the awards (as I was careful to state in the answer to that question) might have been much greater than it was. And I went on to explain that that was, I believed, partly because the exhibitors, with their characteristic apathy, had not taken the trouble to see that the merits of their exhibits were properly brought under the notice of the jury.

869. One can understand, as you described just now, a perfectly honest award, as between the competitors in one national section. But do you think it possible that the allegation that awards are not satisfactory may be due to jealousy as between foreign and British sections—that you may get, in fact, a fair award within a British section, but not outside it?—I know, from my experience of international juries, that, more or less, every juror feels bound to be an advocate for the exhibitors from the country which he represents. But, having regard to the character of the men who compose these international juries, I do not think that that very natural and pardonable feeling is allowed to warp the judgment of the jury as a whole to the extent of giving a higher award in the case of country A than in the case of country B, unless the character of the exhibit justifies it. It must be borne in mind, moreover, that the final determination of the award does not rest with the primary jury—that is, with the jury who in the first instance adjudicated upon the exhibits. There are generally two courts of appeal—an appeal to the superior jury and an appeal beyond that. My experience is that in some instances there have been cases where some readjustment has been shown to be justified, owing to the circumstance that perhaps some of the members of the first jury have been a little partial. But I believe it is quite exceptional that such an unfair distribution as that would imply has been primarily suggested; and I do not know of any case in which it has been ultimately carried through, because I think the machinery for appeal provides sufficiently against any risk of that

870. (*Mr. Algernon Law.*) I gather that you did not receive any complaints from the firms who were not selected by you to join in the modified collective chemical exhibit?—We received no actual complaint. There were some informal suggestions made that certain firms who had not been invited would be perfectly willing to accept an invitation to do so. One could easily see, of course, that the firms in respect of whom those remarks were made were desirous of coming in. But we had no real difficulty on that point, because our committee was of such a constitution that we were able to speak authoritatively, and there was not any second-rate firm, in point of fact, whom we did not invite who would have had sufficient courage to press an application of that sort.

871. Do you think it is equally important to take part in special exhibitions—such, we will say, as the electrical exhibition, as it is in the large international exhibitions?—The same thing applies in a modified degree. I think there should be some limit to the extent to which the British Government should be called upon to contribute to exhibitions of this kind. It is conceivable that there might be an unnecessary multiplication of exhibitions of that sort. I think that it would certainly not do to make any hard-and-fast rule that whenever an exhibition, either general or special, of an international character was organised, this country should necessarily participate. I certainly should be sorry if, in anything that I have said, I have conveyed the impression that I should advocate anything of that nature. I do not think that indiscriminate participation could be otherwise than highly undesirable. We must, of course, draw the line at exhibitions of a certain standing and character. Specifically answering your question, I would say that there may be special exhibitions—the electrical exhibition, for instance—in regard to which all that I have said as to general international exhibitions would, I venture to think, apply.

872. The last exhibition you took part in was, I understand, the Milan Exhibition. Have you anything to say to the Committee on the subject of that exhibition—in particular as to how far it was a success generally, from our point of view, having regard to the grant given?—Perhaps I had better confine myself to saying that I think it was an illustration of the comparative failure or limited success resulting from an attempt to secure British participation without adequate facilities being placed at the disposal of those who were organising it.

873. (*Chairman.*) What facilities do you mean—money?—Chiefly money.

874. (*Sir Isidore Spielmann.*) Is it supposed that we participated officially in the Milan Exhibition?—Yes.

875. (*Mr. Algernon Law.*) Because of the official grant?—Not officially otherwise, but only *quâ* grant.

876. (*Sir Isidore Spielmann.*) Was it regarded as a British Government exhibit?—It was regarded as such unquestionably.

Sir B. Redwood.
30 Nov. 1906.

FOURTH DAY.

Friday, 7th December 1906.

PRESENT:

Sir Alfred E. Bateman, K.C.M.G. (*Chairman*).
The Right Hon. Sir James Kitson, Bart., M.P.
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G.
Mr. Algernon Law.
Mr. Malcolm Ramsay, C.B.
Sir Swire Smith.
Sir Isidore Spielmann.
Mr. U. F. Wintour (*Secretary*).

Mr. Alfred Maskell, F.S.A., called; and examined.

877. (*Chairman.*) I think you have been connected with the Department of Science and Art?—Yes, though not in a permanent way. For a great number of years I have been sent on special missions for the Department or by the Committee of the Council on Education.

878. What has been your connection with exhibitions?—I had an official connection with the Department in the case of the International Exhibitions at Munich and Brussels some years ago. At the International Inventions and Music Exhibition, held in London in 1885 I had the control of the second division—the music division—which was an extremely important one, including the general trade exhibits, and the collection and installation of the very important Retrospective Exhibition. Besides this official experience, I have had the experience of visiting most of the Continental universal exhibitions. I have for many years taken considerable interest in the subject, and have made a study of the Reports and Blue Books on the subject.

879. Are you referring to music only now?—No; I have taken an interest in the whole question of exhibitions. I do not pretend to be an expert in music. Then I have had a considerable acquaintance with the views of the leading industrial and manufacturing firms on the question of participation in universal exhibitions, and I have also a large acquaintance from residence with several foreign countries and our colonies.

880. Have you formed any opinion as to the effect of these exhibitions on the manufacturing and exporting trades of this country?—I have a very high opinion of the value generally of international exhibitions, but I do not think that they have been so largely taken advantage of by this country as in others, where the system of organisation, I think, is different.

881. Would your answer apply equally to the effect on the manufacturing trades, on British art, and on our general commercial relations?—Yes.

882. In your opinion, which are the particular industries or classes of industries which are chiefly benefited by exhibitions, and in what way?—It being taken for granted that exhibitions, properly managed, are of considerable value to commerce, I do not think I could pick out any class particularly, but I should say it would follow that all would benefit. Can anyone doubt, for example, the benefit to the motor trade of the late exhibition at Olympia, or the one now running at Paris? I consider a universal exhibition is merely an extension of that principle.

883. Do you think a staple industry—such, for instance, as the great cotton industry of Lancashire—is helped by an exhibition?—I should think it would apply more to the exhibition of manufactured articles. From the point of view of the manufacturer, the exhibition of the finished article, I think, must help.

884. Then you take it rather that specialities—and new specialities particularly—are helped more than staples, which are made in other countries very much as they are made here?—Yes.

885. Have you had much experience in the classes of machinery?—I should say definitely, no.

886. On the other hand, do you consider that the interests of any industry or classes of industry are adversely affected by exhibitions?—I do not think so. I think it may be said that those who exhibit are pretty well able to take care of themselves.

887. Do you think that the direct commercial results obtained by the official participation of this country in international exhibitions have been such as to warrant his Majesty's Government in giving grants for the organisation of British exhibits in future?—I think that the participation of the Government is of the very first importance, and is absolutely necessary.

888. Would you say that it is better than leaving it to private enterprise?—I do not think that private enterprise ever would possibly endeavour to organise a general international exhibition of all the products of a country in a foreign country. In its own country, as in the case of the Motor Exhibition, a particular industry or trade is likely to be taken up and very persistently run with very great benefit, but I do not think it at all likely that any private enterprise would ever dream of organising the participation of this country in a general way in an exhibition in a foreign country.

889. That is, you think private enterprise can organise one great class of exhibits, but not a whole exhibition?—That is so.

890. Then you still have some belief in Government organisation being better than private organisation?—I think it is of the very first importance. The question may be reasonably asked whether, the credit of the country being at stake, it is not the duty of the Government to act and represent the nation, but further inquiry follows whether of late years that credit has been adequately upheld.

891. I should like to hear from you the particular point in which you think that organisation by the Government would be better than organisation by private individuals or by Chambers of Commerce?—I fancy that in foreign countries, for instance, the Government steps in more in its official capacity and more in a bureaucratic way than we do here. May I refer to the reasons why this country has not been properly represented, and the steps that should be taken to alter that? I think that the Government representation which I wish to urge has considerable relation to that. One of the very great questions, I think, with regard

Mr. A. Maskell, F.S.A.
7 *Dec.* 1906.

Mr. A. Maskell, F.S.A.

7 Dec. 1906.

to the success or non-success of exhibitions of late years is the want of participation, and the difficulty in inducing exhibitors to come forward and exhibit. My reply to that is, take the case of a foreign country where the Government interferes more than it does here.

892. Will you mention a foreign country?—Let us take, say, France. As we know, the French have a large organisation, and they are able to exercise considerable pressure upon such bodies as Chambers of Commerce and corporations throughout the country, and they have the valuable assistance and even pressure of such officials as their prefects. My suggestion with regard to the extension of Government pressure in this country for the purpose of inducing exhibitors to come forward is that no private method of management can exercise throughout the whole of this country, as a national affair or an Imperial affair, the influence that the Government itself could exercise. Even supposing more use should be made of the Chambers of Commerce and corporations throughout the country, naturally the Government would be the body to request them to take the necessary steps and to aid them in doing so.

893. But the great firms will exhibit for their own purposes; if they do not think it is good for their trade, they will not exhibit merely because they are asked by the Government, will they?—I have found that pressure of a kind or inducement can be exercised by the Government, and even, as you know, by the effect of great names.

894. I am not sure that we should want to exercise pressure by great names, unless it was for the benefit of our manufacturers, should we?—But it is for their benefit.

895. You think it is for their benefit, but they do not know it?—I think experience has always shown that a certain pressure is necessary to induce them to organise.

896. Do you approve of the form in which the foreign exhibits are generally arranged now, that is, as collective exhibits?—Have you studied that question, may I ask?—Yes, I have; and I want to go into the question of the jury, and to suggest the substitution of an alternative method, which would mean to a considerable extent the method of collective exhibits, but at the same time selected ones.

897. Of the two systems, grouping by classes and grouping by nations, which do you prefer?—As you are aware, in Paris in 1900, and in St. Louis in 1904 the practice was followed of grouping in classes similar products from all nations, instead of allotting a space to each nation in which to show all its products. I think if exhibitors were consulted they would prefer the latter plan. From the national point of view, in my opinion, the effect would certainly be more imposing, more striking, and more calculated to attract attention. It is as if one is planting 100 or so of tulips in a garden; the effect of them in a mass is far greater than if they were planted about singly. From the exhibitor's point of view, I doubt if he would care to have next door to his exhibits a competing one from a foreign country. I have had from time to time a good deal of conversation with exhibitors on that particular point, and I gather that they would hold that rather strongly.

898. You mean that they would be in favour of a national exhibit?—Yes, they would prefer to exhibit amongst their own nation. Take the case of a piano manufacturer, for instance. If I were a piano manufacturer, personally I would not particularly like my piano to be *here*, and one of a foreign maker's just over *there*. I can very well imagine foreign visitors saying, "Let us go and see what England has got to show in the way of pianos," and going and seeing what England has to show; but if next door to us you have a piano by a maker of another nation, I think, whatever the value of this piano of ours may be, that is calculated rather to lead at once to an invidious comparison, and personally, if I were the exhibitor of that article, I should not care for it.

899. Must not comparisons always be invidious ones?—Yes.

900. But is not comparison what an exhibition is for? If you were interested in pianos, would you not like to go and see all the pianos there?—At the same time, I think we ought to do everything we can and to take every possible opportunity we can to raise the credit of the country. It does not follow that the person who forms an invidious opinion of our piano is necessarily right. The wrong effect may be produced, because he may not be sufficiently educated to understand it.

901. Anyhow, we may take it from you that you prefer a national exhibit to an exhibit by classes?—Yes, and I think, judging from my experience, that that view is held by a good many.

902. Have you anything to say upon the question of publicity and advertising?—I think it must be admitted that the success of an exhibition depends upon the adhesion of as many of our manufacturers and industrials as we can possibly get hold of. It will also be allowed, I think, that so far there has been always considerable difficulty, and we have not succeeded. The question, therefore, appears to me to be to endeavour to discover what further inducements can be given to the manufacturers and industrials to exhibit. I think they all complain that this country especially does not know sufficiently about it, and that there is not sufficient publicity given. The whole question of an exhibition resolves itself, in my opinion, into a gigantic advertisement for the country concerned, and the more we advertise the greater benefit will those who exhibit derive from it.

903. Do you mean that the people who have things to exhibit do not know that there is an exhibition coming on?—That is one point. They do know it at one time, but one great point of complaint amongst them in all recent cases is that they had not been given sufficient notice.

904. We have been told that a great number of applications are sent out to all the chief manufacturers asking them to exhibit?—They complain that they are not sent out early enough, for one thing. Then, I think, personally, that sufficient pressure is not afterwards used. As a rule, hitherto, the organisation of an exhibition has been to a very great extent limited to this scattering of circulars broadcast, and then leaving it to take care of itself, except in the cases of official exhibits or collections of exhibits.

905. Do you think that somebody should go round to the chief towns?—If I may give an instance that occurs to me, I dare say you will remember that in the earlier years of exhibitions one of the most prominent managers of exhibitions was the late Sir Philip Cunliffe Owen. Sir Philip Cunliffe Owen, I think, made it one of the great businesses of his life; he was always at it; consequently, not only in this country, but in foreign countries wherever he went—and he had considerable influence in this country and also in foreign countries with manufacturers, and he had considerable knowledge of his subject—not only after the Royal Commission had been formed, but always, he was constantly making arrangements and preparations for a forthcoming exhibition.

906. And using his personal influence?—And using very much indeed his personal influence. I am perfectly certain that his personal influence was of extreme value, and I do not think anybody will deny that some of the exhibitions a few years before his death were almost entirely due to his very strong personal influence. What I want to deduce from this, I think, is, if it were not inadvisable, perhaps, for me to say anything on that point, that there should be practically a permanent board.

907. But we should like you to say something on that point, if you have any views on it?—I think, especially in this country, a permanent board of the kind would be of the very greatest value and importance. It would to a certain extent, take, or it ought to do so, the place of the influence exercised by Sir Philip, that I have just referred to, that is to say, it would be always *au courant* with what was being done, not only in this country, but throughout all Continental countries, and it would be in touch with the organisers, and, what I think are to a very great extent, the permanent boards or bureaus in foreign countries for exhibitions generally.

908. Do you consider that the tariff and customs regulations have been obstacles to exhibitors in the past?—I gather that they have been very great obstacles. This is probably a question which has already been brought before you, and you have already very likely received a good deal of evidence upon it. I think it is one upon which objection applies more particularly to America, Russia,

and very distant countries. Nearer home exhibitors have the advantage of large numbers of visitors from their own country, and I think we ought not only to consider the effect upon the foreign country, but the effect upon the very large number of visitors who go from our own country.

909. And also, I suppose, upon the visitors from other countries?—Certainly—in addition to those who belong to the country in which the exhibition is held.

910. Is the objection you refer to that the tariffs in the country where the exhibition is held are so high that it is no good our people exhibiting their goods there?—That they are not able to dispose of the products which they have exhibited.

911. Do you mean that the goods themselves have to be brought back?—Yes. They say, "What is the value of going to this place?" Take the case of the last exhibition in America—for I think this objection applies more particularly to America, and, we will say, to Russia. One may ask what has been the value to the trade of this country from the late exhibition at St. Louis? In this country itself very few people are aware that anything was done at all in connection with that exhibition, as there was so very little publicity. As you will gather from the report, practically nothing was sold of the exhibits, and, as a matter of fact, I am inclined to ask why America asked us to participate. I think the reason is not a difficult one to give. We know that America's policy is to keep out the manufacturers of other countries. Their object, then, in asking us to exhibit was probably to get notions from us. That alone, I should think, would induce our own people here to be rather shy of going.

912. Is that not rather an objection to all foreign exhibitions?—But, at any rate, in other exhibitions you have the chance of deriving some benefit. Take, again, the case of this last exhibition in America. The question to me is what possible benefit it could be to our manufacturers; while, on the other hand, there is a possible considerable detriment.

913. Surely that is rather an argument against what you have told us before?—Applied to America, yes. But I think, from my experience of those to whom I have spoken amongst traders and manufacturers, they would not apply it to our American colonies—Canada and others.

914. Would not the fact of a great many people from Mexico and South America being at St. Louis be of assistance to our exhibitors in getting a market in those countries? You do not appear to think that is a great argument?—I do not think so.

915. Now, I should like to hear your views upon the jury system, and the system of awards and medals?—The jury system and the system of awards and diplomas, which has prevailed universally since at least the great Exhibition of 1851, is rather intimately connected with the general trend of my views. Briefly, the system can hardly be said to be an ideal one, and I do not think it is one upon which exhibitors feel very keenly, or upon which they are satisfied with the methods followed, which have followed for years the same prescriptions and traditions. It cannot, at any rate, be said that the inducement held out has been successful, so far as England is concerned, in overcoming the objections which have for some time prevailed, and caused the abstentions of our leading industries and prevented the gathering together of a display worthy of this country. Whatever may have been at one period or another the value attached to these awards, I venture to say that they are nowadays, if not discredited, at any rate looked upon with indifference. I do not find that an important firm feel that they lose much by not being able to add these awards to their billheads, trade lists, or shop-fronts from the fact of not having been exhibitors. (How many, indeed, come into this category of late years!) Nor, on the other hand, that those who obtain them can feel that the honour is very great when it arises perhaps from the wholesale abstention of others. One is reminded of the case of the boy home from school with the proud distinction of being the first in his class, and concealing the fact that he is the only one in it. I do not propose to follow the question of the objections to the jury system in detail. Some may be gathered from the reports of jurors. For instance, at St. Louis (page 227 of the Report), Mr. Davenport says that "a good exhibit of a low-class art was very likely to receive as high a commendation as a good exhibit of a high-class art. So that there is always a premium upon the lower-class exhibit." In Mr. Litchfield's Report (page 313) there is an interesting suggestion concerning honours of a similar character to the French Legion of Honour. However, this may apply in the present case, it is certain, I think, that in France and in other foreign countries the hope of obtaining a cross or ribbon has an effect of a most stimulating character in procuring the co-operation by exhibiting of the leading industries. That refers generally to the whole trend of my argument, which is to see by what methods we can give greater inducements to exhibitors to come forward.

Mr. A. Maskell, F.S.A.

7 Dec. 1906.

916. Do I understand from you that you rather suggest that there should be something in the nature of a legion of honour for the great exhibitors?—I should not like to go into such a question as that, because it is purely incidental. But I am making here a comparison between the great success in inducing exhibitors to come forward in a country like France and the lesser success here. That is not a point that I myself should personally like to lay stress on.

917. Still you are inclined to think it does help in France?—It comes into the general idea. An alteration of the present system would, of course, involve an international agreement. I may perhaps venture to suggest an alternative. Several years ago—I think it was at the time of the Paris Exhibition of 1889—I wrote a memorandum to Sir Philip Cunliffe Owen, whom I then knew very well, suggesting that the jury system at exhibitions should be discontinued, at any rate in the case of our participation in foreign exhibitions when it necessitated our sending over jurors at considerable expense. I proposed that instead of collecting together an *omnium gatherum* of exhibits, trusting to a great extent to the voluntary participation by means of circulars, that the endeavour should be made to form a worthy representation of this country by a process of selection. By this I did not mean only in the sense of the responsibility by the Royal Commission of the whole, but a rigid restriction to the fittest, that is, to the select exhibits which, under the jury system, would entitle the exhibitor or firm to a Grand Prix award. In point of fact, the jury system should be applied first, instead of at the exhibition itself, and the mere fact of being selected for exhibition should form the distinction and honour, equivalent to the medal or diploma. My suggestion and others as to the practical working were warmly commended by Sir Philip. It may be objected that such a system would be difficult to carry out, and I should agree, if the details fell entirely on the Royal Commission. But in the case of an important exhibition, I suggest that general committees should be formed in all the great centres of industry by the Chambers of Commerce or Corporations, composed of those directly interested, who are moreover experts, and the best qualified judges.

918. Then you would have something like the German system, namely, a sort of competition before the goods were allowed to be exhibited?—That is so.

919. Only, as I understand it, you would do it by decentralisation, that is, you would do it locally by chambers of commerce, or through committees formed by chambers of commerce?—Yes. I have observed that they make a strong point of not having sufficient notice, so as to have time to prepare with extra or special exhibits. The practice has been, I believe, to be content in a general way (there are exceptions, of course) with scattering broadcast a number of circulars and schedules with an invitation to exhibit, and to trust to luck for exhibits coming in. On the Continent I imagine the machinery of government is brought into play. The ministries of commerce and the arts have their special experts familiar with and up to date with the matters concerned. Prefects and officials of that kind exert their influence, and chambers of commerce and municipalities contribute their share.

920. I suppose you are giving us this evidence from your knowledge of the systems followed in Germany and in France; or is it only what you understand to be the case?—I can give you no official details.

921. Then perhaps, as we shall be getting direct evidence from other witnesses on the point, we need not trouble you to elaborate it?—May I say that I have knowledge that at the time of the Paris Exhibition of 1900 if the German Emperor himself had not intervened in a very strong manner Germany would not have been represented as she was. I should like to suggest for the consideration of the Committee,

Mr. A. Maskell, F.S.A.

7 Dec. 1906.

whether a system of decentralisation might not conduce to the participation of this country in foreign exhibitions becoming more of an imperial undertaking. I do not propose to go into details, but generally speaking I mean that the central executive authority might at least be supplemented by the official concurrence of the corporations and chambers of commerce of the great centres of industry, to whom, with the leading manufacturers, should be entrusted the task of gathering together a collective and representative exhibit. Whether these exhibits should be grouped separately at the exhibition, provincially or by cities or districts, and whether by so doing a spirit of emulation and healthy rivalry would be fostered, would be perhaps another matter for consideration.

922. Are we to take it that you think our manufacturers would be content to have their exhibits examined by a local committee, or by representatives of their local chamber, in competition with their neighbours?—I think there might be difficulties, but I think they could be got over without any great trouble.

923. That is your chief suggestion, is it not?—That, and the jury selection system and publicity I think you may say.

924. I suppose you contemplate the State bearing the cost of all this exhibiting, if the exhibits are admitted by competition?—Certainly.

925. (*Sir Isidore Spielmann.*) You say that Great Britain has not succeeded at foreign exhibitions; will you tell us in what way you think we have failed?—Personally I think—and I believe I should be upheld by a good many visitors from this country to the great exhibitions—that generally from an industrial point of view (mainly because of the failure to induce our great manufacturers and industrials to come forward) the result has been by no means a credit to this country. Everyone has felt that, and in fact I have heard very strong language indeed used upon it: I have heard people who have been to these exhibitions say, "I was ashamed of my country."

926. In what way do you gauge success?—I should gauge success also by the general impression that one gathers from one's acquaintances in a foreign country. If I were asked my reason I should give that as the reason. I feel from what I hear from my acquaintances in such a country as France most particularly, that I have no reason to be proud of the result of the exhibition of the industries from here.

927. What I want to arrive at is what you mean by "the result." Do you mean the general appearance of the British display, or amount of business done, or the number of the awards secured?—The amount of business done cannot be generally known. Practically it is the general appearance and poverty of the display.

928. You state that at the St. Louis Exhibition no benefit resulted to this country, and that nothing was sold?—I would not take the selling of the exhibits as the measure of the benefit; but I should very much like to ask, if somebody could tell me, what public benefit has resulted, commensurate with the cost to the country.

929. I think you referred to that in connection with what you call the prohibitive tariff?—I think that had a great deal to do with it.

930. Notwithstanding the prohibitive tariff, which is especially heavy against this country, are you aware that a larger number of works of art was sold from the British section than from all the other foreign sections put together?—I think that is a very interesting point; but I should rather like to know the details, if it were possible. I do not assert it, but I think it is possible that there may be special reasons for that result.

931. On the matter of awards, you say that firms think very little of them, I understand?—I think so, under present conditions.

932. Have you visited establishments such as Waring's or Chubb's or Crosse and Blackwell's, where you see all over their premises notices that they have taken the highest awards at various exhibitions?—Yes. You heard what I said, generally speaking, about the value of these awards. I was speaking only a few days ago—only last week in fact, before I heard that I should be likely to be asked any questions by this Committee—to one of our leading manufacturers, who has not exhibited for some time. I asked him whether his people thought they had lost by not being able to put more medals or other distinctions upon their billheads, and he said, "Certainly not." If they thought that the value of these medals and distinctions was great, they certainly would have come forward to gain them. So I think it may be said of the very large number indeed of our industrials who refrain from exhibiting, surely the fact that they will not come forward and make an effort to gain these medals shows that they do not hold them in very high esteem.

933. Then you have told us that the French exhibitors exhibit under considerable pressure?—I think there is considerable inducement given; I will not say exactly pressure, except that I imagine it must be generally admitted that the Prefects can exercise a very strong official influence. So far as I know, with the single exception that I mentioned just now, the personal one of Sir Philip Cunliffe Owen, we have not had anything to correspond to that in this country.

934. Are you aware that in France between 2,000 and 3,000 of the most important firms in the country are subscribing members to the *Société Française des Expositions à l'Etranger*, and exhibit in every country where they get the chance without any pressure whatever? Do you know that they are only too eager to participate in exhibitions?—May I ask for my information, in order that I might possibly go further, what you deduce from that?

935. You speak of pressure being brought to bear upon them to exhibit, and I wish to ask you whether you know of such a society existing?—I know that it does.

936. So that really no pressure is required on the part of the chief French firms?—I do not say that it is not required. It is exercised and is of considerable value.

937. (*Mr. Malcolm Ramsay.*) May I press you a little further about the value of exhibitions? Do you hold that the value consists in maintaining the general credit of the country, or that it may also partly consist in the benefit it confers upon individuals in the shape of orders and growth of trade?—I look at an exhibition as a vast advertising agency, with the aim, of course, of maintaining the prestige of the country.

938. Of the country generally, or of individual firms?—Of the country generally. It occurred to me, if I may make the comparison, that the organising commission, whatever it may be called, should regard itself to a very great extent as practically the agent, the commercial traveller if you like, on a large scale for this country, and that it should do as a matter of fact, during the period of an exhibition, and more especially during the period of preparation, what our consuls in foreign countries are supposed to do.

939. I do not quite understand whether you hold that the individuals who exhibit at exhibitions derive benefit from so doing or not. You spoke just now of traders saying that it did them no good; do you hold that they are mistaken in that belief?—There are exhibitions and exhibitions. I think, as I said with regard to America, it did them no good. But then, again, the question of our methods of organisation comes in.

940. What is your general view as to the benefit to individuals on the whole?—I think that the benefit to individuals depends very largely upon the special publicity that I want to urge, and that the injury to them is due to the fact of the want of publicity. If there were more publicity they would gain more and they would stand to lose less—a very great deal. At present, when a firm, we will say, gains a diploma or a medal, practically speaking the country does not know, and it certainly does not know whether it was gained absolutely on its own merits or because great numbers of others abstained. As one of them said to me the other day, if it were generally known that there would be a competing exhibit in their line they could not stand out, but would be bound to come in. Reverting once more to the value of awards and to the question whether a firm suffers any injury through not exhibiting, and therefore not securing one, I think that we shall have here a useful application of the value of publicity, not only in the foreign country, but also at home, to which I first of all alluded. To take, for example, the case of the St. Louis Exhibition, how many in this country know whether this or that firm was an exhibitor or not, and if it were what was the value of the exhibit, or what others were in competition? But the more full and extended

the publicity, so much more valuable would be the effect of participation. If in this or that class or group Messrs. So-and-so exhibit, Messrs. This-and-that could not afford to stand out. They could not suffer an inferior firm to obtain an award. Publicity actually forces co-operation, and instead of having to complain of the paucity of response to appeals to exhibit, I think the matter would automatically adjust itself.

941. (*Mr. Harris.*) If, on the one hand, you are urging that we ought by compulsion to bring in all possible manufacturers ——?—May I say by strong inducement?

942. Very well, by strong inducement. If that is your contention, why do you exclude an exhibition in America, as you did just now, from the possibility of conferring any benefit upon our industries?—I think that almost any manufacturer would say to you: "What is the use of sending things to America?" Outside of exhibitions that is pretty generally felt.

943. But why more so with regard to America than, say, France?—On account of the high tariff mainly, and because evidently the American view is to see what they can get out of it, and not to assist us in disposing of our manufactures.

944. Is that not true of nearly every foreign country? Is not every foreign country which invites us to take part in an exhibition thinking also what it can get out of it?—I hope, at any rate, that in foreign countries there is a *quid pro quo*, but it is generally admitted with regard to America that there is no *quid pro quo*.

945. (*Chairman.*) Of course you are aware that we send immense quantities of very high-class articles indeed, to America; china, as an instance?—I am conversant with the report; I know that. But there are other great industries—say cutlery—which were totally unrepresented at St. Louis, although we manage to do a fair business in them also.

946. (*Mr. Wilson Fox.*) From your *précis* I see that you hold a very high opinion of the value of international exhibitions?—I do.

947. But you do not hold at all a high opinion, I find, of the British exhibits at international exhibitions?—So far, no.

948. You say that British exhibits at international exhibitions have been a failure?—I do, at the late ones.

949. A disastrous failure?—Yes, at the late ones.

950. And you think the British exhibits ought to be made better?—Yes.

951. Who do you think is the best judge of whether exhibitions are a good commercial advertisement—the commercial men of this country or gentlemen who go and look at exhibitions as sightseers?—The commercial men of this country, certainly.

952. But they do not appear to regard these large exhibitions as good advertisements?—That is so; but that, I think, implies that they are not satisfied with the methods of organisation.

953. Are there not some very large firms in this country, with enormous capital, who could afford if they chose, with little expense relatively to their output, to organise their own exhibits individually without any Government assistance whatever?—Yes, but the general organisation which they could not control, would affect the value of their so doing. *Mr. A. Maskell, F.S.A.*

954. Why do they not do that? I put it to you that there are many firms in this country who spend annually very large sums in advertisement, and that it would be a small thing to them to spend £3,000 on exhibiting their goods at a large international exhibition; but it would seem in practice that a very large expenditure in the United Kingdom pays them better as an advertisement than showing at international exhibitions?—I do not hold that the mere fact of exposing your goods is an advertisement. That is not the advertisement I refer to. I wish myself to see more use made of the ordinary means of advertisement, such as the Press and other means of that kind in this country, and in the foreign country, while the exhibition is going on. 7 Dec. 1906.

955. There, again, as a matter of business, the Press are pretty keen people, and they will publish anything that it pays them to publish. Anything of real material interest to traders, papers like the "Manchester Guardian" and the "Yorkshire Post," which are largely read by commercial men in the North, will publish. Do you not think if these exhibitions are of importance to commercial men the Press would publish news about them?—I do not think that the Press would refuse to publish anything that related to these exhibitions which was put before them, certainly officially by the organising committees—that is to say, practically by the Government. I simply say that has not been done, and they have not been asked to publish anything.

956. Generally, although many commercial men in this country do not think that it is the best form of advertisement for them, you think that, notwithstanding that, the taxpayer should be asked to advertise these commercial exhibitions in that particular form?—I do, absolutely, because it is for the credit and prestige of the country generally and for other reasons.

957. (*Sir Isidore Spielmann.*) What are the dates of the two exhibitions which you have referred to at Munich and Brussels?—The Brussels Exhibition was held in 1880, and I think the exhibition at Munich was in 1876.

958. Were they both, strictly speaking, international?—Yes.

959. Take the exhibitions at South Kensington, with which you were associated; do you describe those accurately in calling them international?—Certainly; that was the official term.

960. Were they international merely in name, or do the catalogues show that other nations participated in them?—Certainly. Take the Inventions Exhibition, its official title was the International Inventions and Music Exhibition; and I think the promise implied in the title was carried out.

961. Did foreign countries participate?—Yes, but not to a large extent.

962. (*Mr. Malcolm Ramsay.*) How do you define "international" as applied to an exhibition?—I suppose it means that when you organise an international exhibition, you ask the entire world to co-operate; and it is, to a certain extent, I suppose, a competition.

Mr. Arthur Serena, called, and examined.

963. (*Chairman.*) What has been your experience in connection with exhibitions?—I was on the Commission of the Brussels Exhibition, and I have been acting as honorary Executive Commissioner for the Milan Exhibition; but in addition to that, I was on the British committee of the Liège Exhibition, and also on the committees of the two Italian Exhibitions which were held at Earl's Court at intervals—I think there were about 8 or 10 years between one and the other. *Mr. A. Serena*

964. Have you formed any opinion as to their effect on the manufacturing and exporting trades, on British arts, and on the general commercial relations of the countries?—My opinion of the effect of exhibitions in the special directions indicated is that they are a special advantage to the manufacturing and exporting trade of this country, as they bring the users and producers into contact with a wider public, and enable them to place their products before a more numerous body of possible buyers than they would be enabled to do in the ordinary course of commerce, and hence that it affords them an important means of advertising and enlarging their business in an exceptional way. It also gives them a valuable opportunity of gauging the effectiveness of such local agencies as they may have already established. As regards British art, although the trade in products of British art could not conceivably at any time constitute a very considerable proportion of our exports, still, there cannot be any doubt that the sale of products of this kind is more susceptible of increase through the exhibition form of advertisement than the ordinary commercial product, as these undoubtedly good products are extensively bought at exhibitions. As regards the general commercial relations between the countries concerned, there can be no question as to the beneficial effects of exhibitions. Mutual knowledge invariably promotes

Mr. A. Serena.

7 Dec. 1906.

mutual interest, consideration, and esteem, and leads almost invariably to increased business through bringing buyers and producers face to face. Exhibitions also afford valuable and legitimate opportunities for manufacturers to personally discover the possibilities of foreign markets.

965. Which, in your opinion, are the particular industries or classes of industry which have chiefly benefited?—Those products are directly benefited for which there is an extensive though, possibly, undeveloped demand in the locality of a given exhibition, and it is often possible, by showing products of a novel character at exhibitions for which a demand does not exist, to create that demand. The effect of exhibiting is comparable to general advertising, and it is just as difficult in the one case as in the other to state what special industries or products are benefited or what are not by advertising or exhibiting. In this connection I would refer to the enormous change that has been effected through sanitary firms, such as Doulton's, exhibiting at the international exhibitions in France, in the creation thereby of a market for sanitary appliances.

966. On the whole, you think it is in specialities and not in staples that the greatest benefits are derived?—Exactly. In specialities when exhibitions are held in highly developed centres and in staples when held elsewhere.

967. And you give as an example Doulton's specialities in sanitary work?—Yes, of the first category.

968. Do you consider that the interests of any industry or classes of industry are adversely affected by exhibitions; and if so, which are the industries, and in what way are they affected?—It would be a rash thing to say that advertisements injuriously affect any industry or class of industry, so long as it is kept within ordinary bounds, and is judiciously carried out. The same remark applies to exhibiting, providing the exhibit is well and attractively made, so as to impart an ocular impression of the excellence and importance of the exhibit. Purchasers then cannot fail to be influenced to buy. Only minor industries, whose presence in exhibitions I strongly deprecate, and whose object in exhibiting is sales for immediate delivery, might conceivably be prejudicially affected.

969. What do you mean by minor industries?—I mean what are generally known at exhibitions as "fakers." They sell very second-rate articles, such as Birmingham jewellery, the cheap class of jewellery, and the like inferior quality of goods, which can be had very cheaply. They sell them across the counter.

970. They are merely things to be sold on the spot?—Yes.

971. But I suppose there is a great market for cheap things in most European countries?—No doubt there is, but it does not bring great credit to the producing country to offer shoddy goods, and they should not form part of an exhibition.

972. Not to the country, perhaps, but to the exhibitor it does?—The exhibitor generally does a good trade in these things. If it is contended that the exhibition of special products of manufacture (novelties) and special machinery (patents) enables trade rivals to copy and counterfeit, in my opinion the opportunities of so doing is certainly not increased by exhibiting, as these are sufficiently ample already for the unscrupulous, who can with little or no difficulty obtain samples of either through the ordinary wholesale agencies at any time.

973. Do you consider that the direct commercial results obtained by the official participation of this country in international exhibitions have been such as to warrant the Government in giving grants for the organisation of British exhibits in future?—I cannot say whether the direct commercial results obtained by the official participation of this country in international exhibitions has been such as to warrant the grants, but I do say that if this country wishes to maintain her position in the markets of the world she must take part in most of, if not all, international exhibitions.

974. Do you consider that you could have equally satisfactory results from private enterprise?—No successful results can be obtained by unassisted private enterprise for the following reasons:—That a Commission having the State at its back is raised above all suspicions of trade and manufacturing jealousy amongst possible exhibitors, and is therefore enabled to appeal with unquestioned authority to a larger proportion of the exhibiting community than it could otherwise do; in a word, it gives it an independent status and dignity which it could not otherwise possess, for want of which the British exhibitors have at times found themselves at a disadvantage in comparison with those of foreign nations who have been officially represented. In addition to the above I would point out that the condition of State participation, even in a modified degree, necessarily improves the position of the section and the exhibitors therein as well as of the executive, when dealing with a foreign organisation, and enables them to secure the most favourable consideration at their hands in all important matters.

975. Assuming that public money is granted for the organisation of official exhibits, do you consider that the grant should be made subject to any special conditions as regards (a) the accommodation and facilities offered by the exhibition authorities; or (b) the number and quality of exhibits offered by British firms?—As far as condition (a) is concerned the grant of money in aid of an exhibition might very properly vary in proportion with the cost of acommodation and the facilities offered by the organisers of the exhibition in question, but it could not, in my opinion be made to depnd upon condition (b), as the number and quality of exhibits procurable must rather depend on the financial facilities at the disposal of the organising British Commission, whose success depends on their being able to assist firms in various ways, in order to place them on a better footing of equality with their foreign competitors.

976. From your experience, can you state briefly what have been the methods employed by the British Government in organising exhibits?—Exhibits at various international exhibitions have been organised with Governmental aid in two ways, (a) by Royal Commissions, by Royal Warrant, accompanied by a large grant from Parliament; and (b) by commercial Commissions, by the approval of the Foreign Office, with or without a grant of relatively smaller proportions from the Treasury, subsequently ratified by Parliament. To the former category belong the Chicago Commission of 1893 with a grant of £60,000, the Paris Commission of 1900 with a grant of £120,000, and the St. Louis Commission of 1904 with a grant of £150,000. To the latter category belong the Brussels Commission of 1897 with a grant of £5,500, of which £800 was returned to the Treasury, and the Milan Commission of 1906 with a grant of £10,000, of which sum £4,000 may be returned.

977. As you have alluded to the Milan Exhibition, would you tell us how you will be able to return so much?—The grant was given at a very late hour, and we were not able to build any pavilions of our own; even if we had had the money we could not then have built the pavilion, because the best sites had been taken by other nations. We were obliged to take advantage of the pavilions that had been built by the authorities for those nations who cared to go into them, and we bought the space from the authorities so that we might put our exhibits into them. In addition to that, this was the first time that I had handled, as executive officer, an exhibition, and I could not tell to what extent this money would go. Being public money everybody wanted to have a little of it, and I had to be very careful indeed how I spent it.

978. (*Mr. Wilson Fox.*) You resisted those blandishments successfully?—Yes. In addition, my services were given absolutely in an honorary capacity, and I worked with a very small staff at both ends. I induced the London Chamber of Commerce to give us offices free of cost, and I made a similar arrangement on the other side. These, of course, could legitimately have been charged for, and might have entailed the expenditure of considerably more money. I was excessively economical in every way, and handled the thing even more carefully, perhaps, than I would have handled a business of my own. We secured our space from the authorities at a very low price, and sold it to our exhibitors at a higher price, which, however, was still very low, as compared with what other nations were charging, and this enabled us to make a fair profit. The final result will be that after having returned some 25 per cent. of the amount paid to us for space by the exhibitors towards meeting part of the heavy expenditure incurred by them for transport and other charges, we shall have a surplus

—I cannot say exactly of how much, but it will be some £4,000—to give back to the Treasury. The whole business has been worked on purely business lines, and as economically as it could possibly be done.

979. (*Chairman.*) The first reason you gave was a very important one—namely, that you did not spend a lot of money on an expensive pavilion?—If we had built pavilions we would not have had to pay for space, but we should probably have had to charge more to our exhibitors than they actually paid. The exhibition was divided up, and, as a matter of fact, very few nations had all their exhibits under one roof. France had a very fine exhibit of the decorative arts in a beautiful pavilion that was built specially for her in a very prominent position, which enabled her to make a very fine show. In any case, France would have made a good show, but having a pavilion all to themselves they were able to make a finer show than they would have done if they had had to participate in the larger pavilions with the other nations.

980. Do you think the British exhibitors lost or not by not having a pavilion of their own?—I do not think they did, especially in regard to the decorative arts. We had the greatest difficulty in getting exhibitors in that line to send any thing at all. They said, "What is the use of going to compete against Italy and France and also Belgium, who are really ahead in the decorative arts?" They did not think it was worth their while.

981. You are probably aware that there has been a question or two asked in Parliament about the Milan Exhibiton?—I am.

982. There was one asked three days ago by Mr. Wedgwood, and it was answered to the effect, I think, that no complaints had been received by the Milan Commission?—That is perfectly true. We have had absolutely no complaints at all; on the contrary, I have had many complimentary messages sent to me. I do not know what that question can refer to.

983. Did Mr. Wedgwood exhibit?—No, he did not.

984. I suppose if he did he would have exhibited china or porcelain?—The name is very well known, but I do not know whether the Mr. Wedgwood referred to in that connection is connected with the firm.

985. At any rate, you are aware of no complaints of the kind indicated in his question?—None whatever.

986. The London Chamber of Commerce helped you to a great extent, I believe?—The London Chamber of Commerce has always interested itself in exhibitions. I am a very old member of the Council of the London Chamber of Commerce, and they have an Exhibition Committee, of which I am a member. This Exhibition Committee was the nucleus of the Commission that was eventually formed for the Milan Exhibition. The Foreign Office, the Treasury, and the Board of Trade between them delegated the work of forming a Commission to the London Chamber of Commerce, the Associated Chambers of Commerce, and other similar bodies. A few of the members of the London Chamber are members of the Commission, but the Commission is absolutely independent of the Chamber itself, who has had nothing whatever to do with it.

987. Did you find any reluctance to exhibit on account of the connection of the Commission with the London Chamber of Commerce?—I do not think so; I never heard of it.

988. And you do not think there was any opposition among the North-country manufacturers, arising from any jealousy of the London Chamber of Commerce?—I think not. They did not exhibit, as a matter of fact, to any great extent, but it was not for that reason; it was because they did not think it worth while. As I said before, we got this grant at a very late hour, and some of the firms who would otherwise have exhibited, were then very full of work and had not really the time to make an exhibit such as they would have liked to send.

989. They preferred to be making money fast here?—That is so. They were, I know, very busy, all through Yorkshire and Lancashire, and they have been doing remarkably well. More than one of them said to me, "We do not need to go; we are full of work; we are content, and we cannot give our mind to it."

990. They did not look forward to a rainy day, or think that the exhibition might be useful against that time?—No.

991. That is rather a digression, I am afraid, but I thought it would be as well to clear that up as you referred to Milan. The next question I would put to you is one that we have already had evidence on, namely, how do British methods compare with those of other countries? If you have any personal experience on this point we should be glad to hear it, but do not trouble to give hearsay evidence or what you merely understand is other people's views?—I will take the French organisation first, as it will simplify my remarks on other countries. Since 1891, in all matters connected with French participation at international exhibitions, the Government has acted in consultation with a private association known as the French Committee for Foreign Exhibitions, and this has, since 1901, been officially recognised by decree of the President of the Republic as of public utility. On receiving official notification of an international exhibition, the French Government calls upon the Committee to report, and their participation is governed by the advice thus received. The Government leaves all the commercial side of the French representation entirely to this body, reserving to itself only the diplomatic side. In Germany the Government has up to the present officially undertaken the whole organisation and administration of the participation of German industries at international exhibitions, the funds required being partly derived from the public purse and partly from a varying charge for space to certain exhibitors. A private organisation on the lines of the French Committee is in process of formation at the present time, and is intended to supplement and extend beyond official limits, German representation at international exhibitions. The United States have no exhibition organisation, either public or private, of a permanent character, and leave the matter of participation at international exhibitions in the hands of private enterprise. Austria-Hungary has no permanent organisation and depends on spasmodic Government initiative. Belgium has possessed for years a permanent Government organisation depending upon several Government departments, but it has within the last year or eighteen months started a private organisation on the French lines to relieve and supplement Government action. Belgian participation has up to the present time chiefly depended on semi-Government and private initiative for Exhibitions held outside their own country. Italy has no organisation, but one is just being started on the French lines. Switzerland has no organisation; all depends on private initiative, with some Government help. I do not trouble the Committee with minute details of the admirable French organisation, as I have no doubt they are in full possession of them already. There can, however, be no doubt that the existing dual organisation in France has worked admirably for many years, and that it explains the universally remarked extent, beauty and excellence of the French sections at universal exhibitions. I have here the last report of the French Committee, giving the decree, the statutes, and the minutes of all the meetings. The actual working chairman, you will see, is Monsieur Georges Berger.

992. What, in your opinion, have been the chief causes of success or failure of British exhibits in the past; and in what way do you think that the defects, could be remedied in the future?—I think the causes of failure in past exhibitions can be divided into two classes, the first being lack of knowledge and appreciation on the part of the exhibitors of the character and scope of the exhibition, and of the best and most advantageous way of exhibiting. The second is the lack of a definite policy and continuity of action on the part of the organisers of the British sections at international exhibitions. The causes of failure depending on exhibitors are really to a large extent involved in the causes of failure arising from the organisation. The attitude of exhibitors towards international exhibitions is chiefly moulded by want of information, and the only proper remedy is an educatory campaign, which can only be undertaken by a permanent organisation on the lines of the French Committee. Temporary organisations suffer from the initial difficulty of having to get into touch with and impart requisite information to desirable possible exhibitors in a strictly limited and often insufficient time, as well as from the inherent drawback that all their work after the exhibition closes goes for nothing, and that their experience, learnt often at the public expense, is absolutely wasted, while the next exhibition organisation has to start afresh practically without

help from its predecessors. Both classes of defects can be remedied by a permanent organisation working in cordial co-operation with the department of State to which such work is germane, namely, the Board of Trade.

993. You speak about the loss of time in getting into touch with possible exhibitors; how much time did you have in which to try to get exhibits for the Milan Exhibition?—They gave us the grant at the end of September last year, so I could only commence in October, and the exhibition was to have opened on March 15, I think; but, as a matter of fact, it did not open till about four or five weeks after that. We had far too little time, and it was impossible to do anything on a large scale in the time.

994. Did you send out circulars?—We sent out an enormous number of circulars and letters to possible exhibitors in every branch of business, probably some 15,000.

995. And you got a very small proportion of replies?—We wrote to all the Chambers of Commerce to assist us, but I am sorry to say we got very little assistance from them. We circularised and wrote and appealed to all classes, and to all the different trades and manufactures.

996. Did you write through the Associated Chambers, or did you write to the separate chambers direct?—Both. We had several members of the Associated Chambers on our Commission, but we did not rest satisfied with simply writing to the Associated Chambers—we wrote ourselves as a Commission. You asked me just now whether the manufacturers did not exhibit because the London Chamber of Commerce formed the Commission, but, as a matter of fact, the London Chamber of Commerce never appealed to them at all—it was always the Commission.

997. But the Commission was appointed by the London Chamber of Commerce, was it not?—It was not, really. It was appointed by three different bodies. We wrote to all the people in the name of the British Commission, so I do not think any jealousy could come in there.

998. (*Sir Isidore Spielmann.*) You used the offices of the London Chamber of Commerce, did you not?—The people we approached did not know even that. We wrote from Oxford Court, and there are other people in that block of buildings besides the London Chamber of Commerce. We had rooms in Oxford Court, which the Chamber had not let and which we got for nothing; but as a matter of fact, I could have had the Commission in my office, or anywhere I liked.

999. (*Chairman.*) I see that you say in the introduction to your report "Besides the London Chamber of Commerce, *under whose auspices the Commission was formed*, the Association of Chambers of Commerce," and so on?—The Exhibition Committee of the London Chamber of Commerce was the nucleus of the larger Commission which was eventually formed. Most of the members of the Commission are not associated in any way with the London Chamber of Commerce.

1000. Still it was the London Chamber of Commerce who came forward very usefully to do this, and who did good work in connection with it?—That is so, but the exhibitors probably did not know anything about that.

1001. At any rate, you do not think there was on the part of the Northern and Midland Counties' exhibitors any feeling of jealousy of the London Chamber of Commerce in the matter?—On the part of the exhibitors, no.

1002. On the part of the people whom you asked to exhibit?—I say certainly not. If there was any jealousy between the Chambers I did not know of it, and I do not see why there should be any. Chambers of Commerce might perhaps feel a little jealous that the London Chamber of Commerce were connected with the Commission, but I doubt it. I do not think that consideration applies here, because, as I said before, it was the Commission that communicated with the Chambers of Commerce, not the London Chamber of Commerce. In addition to which, a fair number of provincial members of Chambers of Commerce were on the Commission.

1003. Do you consider that any, and if so, which, of the methods employed by foreign countries could usefully be adopted for the organisation of British exhibits?—I consider that the methods of the French, with some necessary modifications to suit our national modes of looking at things, should be adopted to deal with British participation in international exhibitions, and that this organisation should receive habitual recognition at the hands of the Government.

1004. Do you consider that the appointment of a Royal Commission would constitute a satisfactory method of dealing with the organisation and preparation of the British exhibits?—I do not consider that a Royal Commission is at all a satisfactory method of dealing with the organisation and presentation of British exhibits (*a*) because of its necessarily temporary constitution; (*b*) because of its non-commercial way of handling the work to be done, and the consequent want of confidence on the part of the trading and manufacturing community in its work; (*c*) because of the inflexibility of its official traditions and actions; and (*d*) because the commercial community expect unreasonable concessions from a Royal Commission with the unlimited resources of the Treasury behind it, which are alike detrimental to the general taxpayer and to the exhibitor, the one being called upon to subsidise quasi-private interests, and the other losing the practice of self-reliance and personal initiative which are so indispensible in business. What is really required is a national representative committee, drawn from all the representatives of various branches of British industry and commerce, combined with due Government representation.

1005. Is that not what is aimed at on an ordinary Royal Commission?—Yes, but it is never attained. With regard to the £10,000 that I had to handle, because it was Government money there was a general idea that anyone and everyone had a claim to some of it. These matters can best be dealt with by those who have been trained to direct large business concerns, and who, in consequence, are in a better position to make the best use of any money at their command.

1006. Do you prefer the procedure at Milan to the procedure, say, at St. Louis?—Yes, but the permanent body that I suggest should, I think, exist, so that it would not be necessary to have these temporary commissions.

1007. Would you have it appointed by the Government?—No. Government should be represented thereon in conjunction with representatives of the Chambers of Commerce and manufacturers, and, in fact, of the people who are interested in exhibitions, but should not appoint.

1008. I suppose the Government would have to appoint somebody; or should it be left to the London Chamber of Commerce, or to the Associated Chambers of Commerce, or to any separate chambers?—I should say that it should be done by combined action. The Government can appoint in consultation with those bodies.

1009. I do not quite understand what sort of body you wish?—I want a body similar to the one they have in France. That body gets assistance from the Government in proportion to the importance of the exhibition. It is a permanent body, and the exhibitors themselves contribute to its funds. An exhibition starts to-day in any part of the world outside France, and that body has funds to organise it without delay. In the last few weeks we have had applications at the Chamber of Commerce for quite a number of exhibitions. We cannot handle them at all satisfactorily because we have no money. The French body has always funds with which to make inquiries, and it can send to the place and see whether it is desirable to take part in the proposed exhibition. I say that is a very great advantage. Then this body composed of responsible parties can go to the Government with confidence and suggest the assistance that should be given.

1010. This body is a society which, like many other of the French societies, is recognised as of public utility. It has subscriptions from its members, and it gets a grant from the Government, and, as you say, it advises the Government what should be done in connection with a big exhibition?—That is the position.

1011. Do you prefer a society of that sort to a small department entirely under the Government?—Undoubtedly, because it is composed exclusively of business men, and they are much better able to gauge the position and to ascertain whether it is to the interest of their country to take part in an exhibition.

1012. You understand thoroughly, I see, the difference between that method and the German method, which is essentially bureaucratic?—Yes. I say the organisation should be in the hands of those who exhibit—in the hands, that is, of the business element of the country.

1013. But you recognise that it should be a permanent body?—Yes.

1014. And spending very little, I suppose, in the ordinary way?—Yes. If you will glance through the Minutes of the French Committee, you will see that they are dealing with exhibitions in all parts of the world; some of them being quite small and insignificant.

1015. Are there any special views you have about the prizes which are awarded at exhibitions. Do you think they can be given up, or do you think they are important?—I have come to the conclusion that they are not of much value, having regard to the way in which they are given at the present time. They are given with too much liberality, but as long as exhibitors are anxious to obtain them, it would seem to be the duty of the executive to help them to do so.

1016. (*Mr. Wilson Fox.*) I see that at the Milan Exhibition there were about 341 exhibitors?—I think that is about the number.

1017. As far as I can see from the headings I have got, there were very few manufacturing exhibits?—There were a fair number.

1018. I will take the headings. There is first Land Transport?—The exhibits were divided into ten sections. Among these was one called the Working Hall, which was occupied by machinery in motion producing finished articles. That was a most important section.

1019. I see nothing in my list about manufactures pure and simple, except lace. I have not got textiles, nor iron or steel?—Textiles were included in group 42 (section 4) as decorative art products, and in groups 51, 52, and 53 of the Working Hall (section 5) in connection with the machinery producing them. They were further included in group 6 (section 1) in connection with special clothing for travelling and sport, and in group 21, in materials for aeronautics. In group 29 (section 2) for the equipment of ships, and in group 41 (section 4) in their application to furniture and hangings. Iron and steel were included in several groups of section 1 in connection with the equipment of railways, tramways, etc., and in section 2 in connection with ships, and in the Working Hall in connection with machinery in general.

1020. There is no heading of Textiles. What do they come under?—They come mostly under the Working Hall and Decorative Arts. I must tell you that those who initiated the Exhibition at Milan did not intend it to be a Universal Exhibition for all industries. They intended to limit it to Land and Sea Transportation, the two great industries chiefly affected by the opening of the Simplon Tunnel. It subsequently grew far beyond anything that they had anticipated. They never had any textiles as such, except in the Decorative Arts, but they had a Working Hall with machinery in motion which produced textiles.

1021. What manufactures were shown at Milan?—There was paper-making, goldsmiths' work, manufacture of metals in general, porcelain-making, china and earthenware manufacturing, glass-making, leather-dressing, and the manufacture of leather articles. Lastly, spinning of cotton, hemp, jute, wool, and silk.

1022. That would come under the head of Textiles?—Yes. Then, very important machinery was there.

1023. Did you show any forms of food?—Yes, and you will find the food under the head of Temporary Exhibits. We were not responsible for the classifications; they made the classifications, and we had to place our exhibits accordingly.

1024. I should like to know what proportion the manufacturing exhibitors, wholesale and retail, bore to the total number of British exhibitors at the exhibition?—I put in the following table*, which shows that the proportion of manufacturers and merchants to the total number of exhibitors was 51 per cent., and if the shipbuilders be included, then the proportion would become 54 per cent., or more than half.

1025. I understood you to say that you consider our commercial supremacy practically depends on our exhibiting at foreign exhibitions; is that your view?—I say that if there are exhibitions, this country must be adequately represented.

1026. I thought you said our commercial supremacy would depend upon our exhibiting at foreign exhibitions; that is to say, that if we did not exhibit our commercial supremacy would be lost?—We should lose ground, undoubtedly.

1027. The position of commercial supremacy which Great Britain has reached has not been gained by participation in international exhibitions, has it?—No.

1028. Why should it be more likely that we should retain our commercial supremacy by taking part in exhibitions, when the position which we have attained in the commercial world has not been produced so far by participation in international exhibitions?—Because we are losing ground in many of the markets, and other countries have gone ahead. Unless we show those who buy our manufactures that we are in a

* TABLE showing the Number of Manufacturers and Merchants in Comparison with Ordinary Exhibitors at Milan, 1906.

Mr. A. Serena.

7 Dec. 1906.

position to do as well as these other countries, we shall lose ground all the time.

1029. Is there any evidence at all to show—if there is I should like to hear of it; I do not say it does not exist—that foreign countries have gained anything at all by showing at international exhibitions?—I cannot produce any evidence to this effect, but the fact that foreign countries are so keen to take part in any and every exhibition would tend to prove that they are satisfied they do gain considerably by so doing.

1030. That is the first proposition which wants proof, is it not?—Undoubtedly. Merely as an advertisement it is a good thing to exhibit in foreign countries.

1031. We have had information that some of our best people, particularly in certain trades like machinery, will not show because they are afraid of having their goods copied?—I think that is a very feeble excuse for the reasons stated in my answer 972.

1032. We have had that from people who have considered the question?—I may be wrong, but I say that if anybody wishes to copy a piece of machinery, they can go and buy it and copy it afterwards. Anybody in the trade who wishes to copy a thing has the means of buying it.

1033. To take another point that has been put before us, I put it to you, in the first place, that it is much more likely that we should get our machinery copied in America when it is sent out there, and Americans are saved the trouble of coming over here and ferreting out the machinery in order to copy it?—I think they would do it in any case if it was worth their while.

1034. However, that may be, have you not heard there is a considerable reluctance on the part of British exhibitors to exhibit?—Certainly.

1035. Particularly on the part of the first-class people?—Yes.

1036. The first-class people are the ones who could afford to exhibit most?—Yes.

1037. If they can afford to exhibit, and do not exhibit, do you not think the reason is because they consider that particular form of advertisement is not worth the money?—Evidently; otherwise they would do it, unless it be that they have so much work that they do not trouble to extend their connections.

1038. That is probably the view of many of our leading commercial firms?—I think so.

1039. Why should the Government step in and tell them, "You are wrong about this question of advertisement; and we are going to put money down and advertise for you, because we think this particular form of advertisement is right, although you think it is wrong." Do you think the Government should take that attitude?—One of the reasons why these firms will not exhibit is, I think, because of the great cost attached to it. Other Governments defray part of the cost, whereas our Government does not. Our firms do not think it is worth their while to exhibit under those conditions.

1040. Applying that principle to England, might not many traders say, "We should very much like to exhibit in England, but we cannot afford to put up advertisements on omnibuses and at railway stations"; and if so, are the Government to supplement that form of advertisement?—No.

1041. You think they should only pay for advertisements abroad, and not for advertisements in England?—I say that if we want to keep our foreign trade, or to increase it, we must exhibit because the foreigners exhibit.

1042. Is that not rather begging the question? Have we not first to prove that foreign exhibitions do assist foreigners in pushing their trade?—Yes.

1043. If we once establish that, we might then take the attitude which you are taking, that we are rather out of the hunt?—So we are in many markets.

1044. But have you not first to prove that these exhibitions are helping the foreigner? You say we are out of it in many markets, but you have to prove first, surely, that we are out of those markets, because we do not take part in international exhibitions?—We are out of those markets, really, because we do not cultivate them. We do not adapt ourselves to the requirements of those countries, we do not quote in the currency of the country, we do not quote to them in their weights and measures, but go on in the antiquated mode we have been going on for generations instead of adopting more modern methods.

1045. In considering what exhibits the British exhibitor should send to a foreign exhibition, has the matter ever been considered by the London Chamber of Commerce on any scientific basis; that is, have you examined the tariff of the particular foreign country in which we are showing, to see in what line of goods it would be worth while to send things for exhibition?—I do not think so in every case, but it was certainly done in some cases.

1046. Also, has the London Chamber of Commerce examined the class of goods which other countries send, in order to see scientifically which class of goods have a chance of being pushed in that foreign country, and which class of goods have no chance?—The London Chamber of Commerce has taken no such steps so far as I know, but the Commission did.

1047. Do you not think that in dealing with the British exhibits sent to a foreign country it would be a good thing to ascertain really what goods it was hopeless to push and what goods there was a prospect of pushing?—It would be so. In the case of Milan, there is a British Chamber of Commerce in Italy who did issue a circular letter, recommending that certain articles should be sent to this exhibition, because there was a good market for them. The manufacutrers took no notice whatever of that. In addition the British Consul at Milan, who is a very active and very able man, has reported on several occasions what should be sent and the class of goods that would find a market, but the manufacturer here has likewise taken no notice of that.

1048. Would you generally agree that if we take part in exhibitions at all a more scientific consideration of the arrangements of the exhibition should be made?—Certainly. I should agree to that.

1049. (*Mr. Harris.*) Did I rightly understand you to say that your general view was that British exhibits in the past have been, broadly speaking, a failure?—I have told you the experience I have had of exhibitions, which has been of a limited character. I have never taken such an active part in any exhibition as I have in this one, so that I really cannot speak with any authority upon what exhibitions in the past have done. In the case of the Italian Exhibitions at Earl's Court there was a very large business done in this country from the Italian point of view, and therefore I should think that these exhibitions do give good results at times.

1050. How do you mean, from the Italian point of view?—I mean from the Italian exhibitors' point of view. Italian exhibits were sold in London.

1051. Did they sell here the goods which they brought over?—They sold very largely here the things which they brought over, and secured orders upon other things that they exhibited.

1052. Yet I understood you a little time back to tell the Chairman that you wanted to knock out all what you call minor industries, although apparently those were the very people who were doing a business?—I was then speaking of the lower class who are usually called "fakers," because they sell goods that really are not always what they are represented to be, and are of a very low grade of quality, and so discredit the exhibition.

1053. Your view is that that would have a bad effect?—Absolutely bad.

1054. Going for one moment to the Exhibition at Milan, you say that the French made a very good show indeed there, and that you could not put up a pavilion, and had, as I understand, to distribute your exhibits in consequence. Now do you think that France has made a great deal out of that exhibition as against ourselves?—I do not think so. I think that no nation in connection with Milan has made much money. I think it has been rather a disappointment to all the nations. The better class of goods has not been sold. Whether it is that Italy has not the money (although its position is very much improved), or whether it is that the goods are not required in the country, I do not know; but as a matter of fact, taken as a whole, I think the sales have been of a very modest character.

1055. Have you any view whether it is better to exhibit goods of the same class from different countries side by side, or whether it is wiser to make one

national exhibit?—I think goods classed side by side is the best arrangement. That is what happened at Milan. What I said of the pavilions did not refer to all the sections; for instance, all the nations were represented in the Working Hall, which was the one they laid most stress upon, and which contained machinery in motion actually producing the finished article. The exhibits were divided into sections in accordance with their nature, so that side by side you would find two firms, a French and an Italian firm say, manufacturing paper, and you could compare the two.

1056. Were some of the British exhibits exhibited in that section?—Yes.

1057. You did not hear any complaints that they were frightened by the idea of exhibiting side by side with their foreign competitors, did you?—Not on the part of those who exhibited; but that was brought before us. Many exhibitors have raised the question that they did not want the foreigner to copy them.

1058. But were they afraid apparently of somebody saying "This is an inferior article"?—I have not heard that.

1059. That was rather suggested to us by one witness, and I wanted to hear your view of it. That witness suggested that if you had a number of pianos side by side, certain English firms would be rather afraid of somebody coming and saying, "That is such-and-such a firm's, but it does not compare very well with this German piano"?—That would be the English maker's fault. If he cannot produce an article as good as another firm, then he does not deserve to sell his pianos.

1060. But you have not heard that alleged or suggested?—No; but I can quite imagine its being suggested.

1061. (*Mr. Malcolm Ramsay.*) You were saying just now that England was losing her commercial supremacy, and I understood your view to be that therefore it was necessary for us to participate in exhibitions; do I correctly represent your view?—There is no doubt that the foreigner has made great headway, and that in many things he is surpassing us.

1062. Assuming that, does the remedy necessarily lie in spending large sums of money on official participation in exhibitions?—Not necessarily, but I think it is necessary that we should be *en evidence* all the time.

1063. That is perhaps rather another aspect of it?—I do not say that you are actually getting trade by it, but at all events you remain before the buying public. If they only see foreign exhibits, they probably would give those exhibitors an order and forget your existence altogether.

1064. May I ask whether you think that the benefit of participating officially in exhibitions takes the form rather of keeping one's own country before the eyes of the world than of getting specific orders for individual exhibitors?—To a great extent, but it also assists the manufacturer to see what the other nations are doing.

1065. Could not the manufacturer do that equally well by taking a return ticket to the exhibition and looking round?—He might.

1066. Without the State having to give a grant of £150,000, or whatever the sum may be?—Of course that was a very extravagant grant.

1067. The manufacturer can see just as well whether he exhibits or not, or whether the Government helps him?—The manufacturer may see, but the consumer does not see.

1068-1069. Is it your experience that the majority of visitors at the big international exhibitions are the people who are on the look out for new goods, and are in fact the purchasing classes?—I certainly think if they are interested in a particular branch they will go to see what the other countries are doing. For instance, in the agricultural implement class we had some of our leading firms here exhibiting; they had a very good show. It was certainly most necessary for them to be there in view of the very fine exhibits sent from Germany, France, Belgium, and other countries. I am quite satisfied that our people who exhibited, went round to see what the foreigners were showing, and whether there was anything new. Or if they did not do so, they should have done so in order to see whether the foreigner was introducing any new methods or anything which they might themselves benefit by.

Mr. A. Serena. 7 Dec. 1906.

1070. I was thinking rather of the large international exhibitions. I ask you whether it is your experience that the majority of visitors who go to exhibitions go there for purposes of business of for purposes of amusement?—I should think they go for the purposes of amusement, but there is always a large class who go for the purposes of business. Take that particular section, the agricultural implement section, you would not get many of the people who visited that section simply on pleasure bent.

1071. Would not the purposes of the manufacturer of agricultural machinery be served a great deal better by a specialised exhibition than by participation in a World's Fair?—No doubt. If they went themselves and visited all the smaller towns and villages of Italy, and if they had a knowledge of the language, they might probably do business. But my point always comes back, that if the other nations exhibit, whilst it may not bring us any direct benefit, it is necessary for us to be there too.

1072. I quite understand that, which I think is the broad ground of policy, but I am trying to get at the practical side in relation to the individual. The class of exhibitions in which I think the Committee are chiefly interested are the large international ones, but, of course, there are others, like the Italian Exhibitions at Earl's Court to which you refer, which, I think, had no State recognition at all. They were organised as a private enterprise, and made a good profit when the weather was fine?—The Italian Government gave assistance. In the first Exhibition it put transports at the disposal of the exhibitors free of cost, and gave Custom facilities and so on, to enable them to develop trade here.

1073. You have told us that exhibitions afford an important means of advertising and enlarging business in an exceptional way; if that is so, do you not think the trader should pay to some extent for his advertisements?—In what way do you mean?

1074. Take, for instance, St. Louis, where the cost of transport and installation was all borne by the Government; do you not think that if the trader gains a good advertisement he should pay a larger share than he has done in recent cases?—Certainly. One point I would like to bring before the Committee is the importance of advertising. The Milan Exhibition was very little known in this country. The Press took no notice of it, we did not subsidise them or advertise, or do anything to induce them to write up the Exhibition. From that point of view I think that it would be a very good thing that a committee such as I suggest, when formed, should advertise and make better known these exhibitions, and so give our people an opportunity of showing.

1075. I am not quite sure that you understand my point. You look upon exhibitions as a means of advertisement either of the country or of the individual largely, do you not?—Yes.

1076. So far as the exhibition is an advertisement of the individual, ought not the individual to pay a large share of the expenses, or do you wish that it should fall upon the State?—I think the individual ought to contribute.

1077. Therefore you are only in favour of a limited State assistance to exhibitions in the way of money?—That is so.

1078. And you do not advocate large grants, such as were given to the Paris and St. Louis Exhibitions?—Not so large as the St. Louis grant.

1079. Can you indicate the extent to which you think the Government ought to pay for participation in exhibitions?—It is very difficult to say; it depends so much upon the distance of the exhibition and the opportunities offered for trade in the country. In the case of Milan we got the space at one price, we got it cheap from the authorities, and we sold it at a higher price, and the exhibitors had to pay the cost of transport, installation, and various other charges, which were very high indeed. But if you have an exhibition in America you cannot put it on the same footing as one that you have in Paris or Brussels.

1080. Is it your view that the individual exhibitor should not be relieved of all the expense of exhibiting?—Yes.

1081. Then you say that England must take part in any and all international exhibitions. Does not that

Mr. A. Serena.
7 Dec. 1906.

open a very wide field for expenditure? Do you mean that we must take part in every international exhibition, however big or however small?—No. An international exhibition would necessarily be on a large footing if it were really international.

1082. The Exhibition at Earls Court is called international, is it not?—I do not mean that Exhibition. I mean an exhibition which is international in the sense that all the nations co-operate. At Earl's Court they have a particular nation every year, and they do not have all the nations combining. An international exhibition means, of course, one open to the whole of the world.

1083. I fancy the organisers of every exhibition in which the world generally is invited to participate call them international; for instance, we have received invitations to take part in an International Maritime Exhibition at Marseilles, and the New Zealand Exhibition is called international?—That is so.

1084. In fact, nearly every exhibition in which more than two or three countries are asked to join is called international?—Of course, you have to study the merits of each exhibition, and this body which I suggest should be formed would have to decide whether it is worth this country's while to exhibit.

1085. Are you clear that the benefit derived from such participation is so signal that it justifies the Government in spending a large amount of the taxpayers' money for the purpose of participating?—Only from the point of view, as I said before, that this country must not be left out altogether.

1086. Would not a wise selection be possible, so as to confine our participation to a few of the leading exhibitions, as we have done in the past?—Yes.

1087. You do not contemplate an extension of our activity in the future, but rather better organisation?—It has always been done in a half-hearted sort of way, I think. The Government has never been disposed to take part in any exhibition.

1088. I am speaking of the money side of it now?—I mean the money. For instance, in connection with the Milan Exhibition there was the greatest difficulty to get any money out of them at all.

1089. I was trying to arrive at some indication of the ultimate expenditure which we should have to incur, because it may assume very serious proportions, and with the income-tax at 1s. that is an important consideration?—I am not in favour of spending large sums, but if the work is placed in proper hands it can be done on economical lines.

1090. (*Mr. Algernon Law.*) You said that all the countries who participated in the Milan Exhibition, even those who were well organised, were disappointed with the result; do you not think that justifies the Treasury in their reluctance to come forward in the case of Milan?—I do not think it necessarily follows that they are not going to do trade there. I am speaking of the actual things which they exhibited. It is very possible that these firms may cultivate relations and develop business which they never had before; but the actual things sold from their pavilions or from the various stands I do not think were very important.

1091. Did the other foreign countries spend much money on their pavilions? Were they extravagant buildings like those at Paris and St. Louis?—There were some fine pavilions, the Belgium pavilion, for instance.

1092. Do you attach importance to a large or extensive pavilion as a means of bringing success to the British exhibitors?—No. It is all a form of advertisement, but I do not think it is at all necessary.

1093. You have spoken of the French organisation, but is not the success of the French in exhibitions largely due to their superior taste, generally speaking?—Certainly.

1094. And the attractive way in which they make up things?—That is what this very society of theirs does. The whole of their exhibits are decorated throughout the exhibition in the same way, and they are very effective. Their show-cases are all alike, whereas our show-cases are all sorts of shapes, heights, and conditions—old things that they had in the first exhibition are still used at exhibitions nowadays. On the other hand, the French Committee have a uniform set of cases, and they make their exhibits look far better.

1095. How many years has the French Committee existed?—I think since 1891.

1096. In the Great Exhibition of 1851 it was remarked that though we were ahead in manufacturing and other solid matters, in regard to taste we were far behind the French?—That was before my time, but in any case I think that is very likely, because the French taste is proverbially good.

1097. The difficulty as to starting the organisation being a temporary one, did you communicate with the ex-secretaries of the Paris and St. Louis Exhibitions to pick up their material, as it were, to assist you in going forward with the Milan Exhibition?—No, except that one of the gentlemen attached to the St. Louis Exhibition is with us, and I got the benefit of his experience. He is Mr. Cundall, and he has been on many exhibitions.

1098. Was there a scrambling for awards at Milan? I think I understood you to say that you could get as many as you wanted almost?—I do not say that quite, but I do think that if a man is sufficiently persistent, he can do something.

1099. So that the success of a country is very much due to the persistency of the gentlemen who organise its exhibits?—No, I will not say that either, but I do say that these awards are given too lightly.

1100. (*Sir Isidore Spielmann.*) I think you said that when you arrived at Milan you found much of the space taken by other nations?—We were invited to take part in this exhibition months before we actually accepted. We could not take any space until we had a Government grant.

1101. Then this difficulty was caused by the fact that you started late?—It arose because we started so late.

1102. Can you tell us how much later than other nations you signified your adhesion?—The French exhibitors, I think, had done so one or two years before. Immediately it was decided to have an exhibition, France came forward; I think that was in the year before.

1103. Do you happen to know if England was the last country, or the last of the great countries, to signify her adhesion?—Yes, she was.

1104. How much later than the others, do you know?—Many months, in some cases. I think Belgium came in just a little before us, and she built a special pavilion, which was a very handsome one.

1105. Otherwise we were the last, or thereabouts, were we?—I think we were the last of the greater nations. There were some after us of the smaller nations.

1106. And do you think that cost you a great deal in the way of hampering your success?—I think it cost us a great deal in not getting more exhibitors.

1107. (*Mr. Malcolm Ramsay.*) Is it the case that you were first of all refused by the Treasury?—Yes.

1108. And you came back subsequently with a later application, which was granted?—The application went on continuously; it was refused, but subsequently the Treasury said they would give us £10,000. That was about two months afterwards.

1109. (*Sir Isidore Spielmann.*) Do you think that the popularity of the London Chamber of Commerce, or the reverse, had anything to do with your succeeding or failing in obtaining exhibitors?—I think it had nothing to do with it. I think, considereing the apathy that exists among British manufacturers and the short space of time that we had, we did remarkably well.

1110. Do you really think that the influence of the London Chamber of Commerce is sufficient to obtain the adhesion of the most important firms?—It is very difficult to say. The London Chamber of Commerce, as I said before, did not do this work, but a Commission was formed, and some members of the Chamber of Commerce belonged to that Commission, but it was absolutely independent.

1111. Do you not think that the fact of your writing from the address of the London Chamber of Commerce influenced it?—I do not think it had anything to do with it. In the first place, as I have explained to you, it is a large building, and there are many other people in that building beyond the London Chamber of Commerce. It cannot be said to make any difference, I think, if you have "2, Oxford Court," or "The

Treasury," on your paper as to whether the exhibitors come in or not.

1112. I gather you would recommend the French system, under the control of the Board of Trade?—I would not say under its control. I would suggest that a body should be formed representative of the manufacturers and combined with official representation. This body should always go to the Government and suggest what should be done.

1113. In reply to the question, "In what way do you think the defects could be remedied in the future," you summed up, I thought, by recommending the organisation of exhibitions under a department of the Board of Trade?—No, I said with their co-operation, I think.

Mr. A. Serena.
7 Dec. 1906.

1114. Then you recommend the French system, but with the co-operation of the Board of Trade?—Yes, that is what I suggest.

Mr. IMRE KIRALFY, called, and examined.

1115. (*Chairman.*) I would ask you first what has been your connection with exhibitions—it has been very large, I think?—Yes, it has. Ever since 1867 I have taken a great interest in exhibitions. During the exhibition of 1867 I was nearly the whole of the time in Paris, and I went there twice or three times a week. Since then I have taken great interest in exhibitions; I have managed a number, and I have advised on five or six. I advised on the St. Louis, Buffalo, and Liège Exhibitions before their foundation.

1116. Did you advise in connection with getting people to exhibit, or in connection with the organisation?—In connection with the general organisation; but in regard to the Liège Exhibition, I was particularly interested in getting exhibits. I had the direction of the British Section there.

1117. Were you on the Committee?—I was the Commissioner-General of the British Section at Liège.

1118. Did you apply to people for exhibits?—Yes.

1119. Have you formed any opinion as to the effects of exhibitions on the manufacturing and exporting trades in this country?—Yes.

1120. What is your opinion?—My opinion is that if the exhibitors unite, as they do in other countries, then unquestionably great benefit ought to result; that is to say, if they display their goods in a manner which is attractive to the public.

1121. As regards British Art, do you think the same?—British Art should be included wherever Great Britain participates in an exhibition. I think it is the greatest possible mistake to undertake to have a British Section at any exhibition unless British Art is represented.

1122. As regards the general commercial relations between the countries concerned, do you think that an exhibition has a good effect or a bad effect?—It must have a good effect. I may have to repeat myself, but if the exhibits are placed in a proper way, the result must be beneficial. Of course, social and commercial intercourse between nations must have a good result.

1123. To carry that a little further, as regards the particular industries or classes of industries which have been benefited, what should you say were the chief?—It is very difficult to decide, because some goods which may derive benefit by exhibition in one country would not derive benefit by exhibition in another country; consequently to make it a success, it would be necessary to study what exhibits should be displayed in a given country in order to have the best advantage from the exhibit.

1124. Do you consider that an exhibition has much effect on the trade in the ordinary staples of commerce, or in any new specialities which one country makes sooner than another?—Of course, it has a particularly good effect in regard to any new specialities; but I think that it ought to have a good effect in every class of exhibits, so long as they represent goods which are acceptable, and goods in which there is a chance of doing any trade with the country in which the exhibition is held. It is useless to exhibit anything which is inferior.

1125. The other branch of my question was whether it is your opinion that exhibitions have much effect upon the staples. By staples I rather mean, for instance, a great many of the cotton fabrics, as opposed to new things, such as motors or india-rubber goods of various kinds?—It depends in which country they are exhibited. I think cotton fabrics in some countries would be attractive, and would bring commerce, whereas in others they would not. In a matter like this, the Chamber of Commerce, in the particular country ought to be consulted always as to what it is best to exhibit and what it is best to avoid in exhibitions.

Mr. I. Kiralfy

1126. I suppose your experience has been rather more in the general get-up and toilet of the exhibition than in the arrangements of the special exhibits?—Yes, because it was always difficult to obtain exhibits. The reason that it is hard is because there is no organisation. You have to apply to every exhibitor individually, and that is a very hard thing to do. I remembers that at the time I took the matter of the Liège Exhibition in hand I wrote something like 200 or 300 letters, and out of those I think I received four or five replies only.

1127. Except at Liège you have not had much experience in industrial exhibiting, have you?—I have had experience at Earl's Court.

1128. But you would not call that an international exhibition, would you?—No.

1129. From your experience, do you consider that the interests of any industry or classes of industry are adversely affected by exhibitions?—I certainly do not think so.

1130. Do you consider that the direct commercial results obtained by the official participation of this country in international exhibitions have been such as to warrant his Majesty's Government in giving grants for the organisation of British exhibits in future?—I am afraid in the past not, but I think by proper organisation in the future the Government will certainly be justified in supporting it, and giving grants.

1131. Do you think that equally satisfactory results could be obtained by private enterprise?—No, not at the start. There is in France an association which is called *Le Comité Français des Expositions à l'Etranger.* The Society was organised for the purpose of promoting French exhibits abroad some twenty years ago. The manufacturers first started that for themselves, but finally it was found to be such a useful organisation that the Government gave it its patronage. Now, whenever there is an exhibition the Government always goes to this Society, and asks them whether they think it worth while participating, and if they say yes, they give considerable grants. At the Chicago Exhibition in 1893 they gave 4,089,700 francs, and the French Section covered 41,627 metres, and they had 2,762 exhibitors. At the St. Louis Exhibition in 1904 the Government gave only 1,460,000 francs, which was entirely used for their own representation through the Commissariat, and the French Committee virtually received nothing out of it. They occupied 76,720 metres, and they had 7,212 exhibitors.

1132. That shows that by giving them a good start, and supporting them at first, it finally comes down to this, that the Government has to give very little?—Yes.

1133. Then you think that this French society has helped to relieve the French Government of payments to exhibitions?—Yes, I do. I think that a similar institution founded in Great Britain would perhaps not have quite the same effect, but would considerably reduce the grant which the Government would have to give. I think it would be necessary, in order to do this, that the Government should start a similar association. A body of merchants and manufacturers could be organised here, which would enable them to instal themselves—that is, to get the plant and to get uniform show cases; in other words, to get what I call a regular working plant good for travelling, so that they could go to any exhibition wherever the Government may want to send. Once they have this organisation, they would be in a position to go anywhere; and, of course, afterwards the expense would be reduced.

Mr. I. Kiralfy.

7 Dec. 1906.

1134. Would you let them have the conduct of the expenditure of the country?—Yes, under the supervision of the Board of Trade. I think the Board of Trade ought to have control, the same as the French Government has the control of this French Committee.

1135. Not only that they should be represented on the Committee, but that they should have absolute control?—Yes; except as to minor details, it ought to be under the control of the Board of Trade, or of a Minister of Commerce.

1136. To whom would you give discretion as regards the exhibits?—There would have to be special committees. In France, under this Society, they have first one central committee, and then they have group committees, probably twenty; and these group committees have under them again sub-committees for the different classes. When they secure space in an exhibition, this central committee buy it at a certain price per metre, and then afterwards sell it to the sub-committees for a certain higher price, the difference being their working expenses. They then organise themselves into small groups in an artistic way, and charge the exhibitor still a higher price, but at the conclusion of the exhibition whatever profit is left is all redistributed to the exhibitors—that is to say, all this is done without any personal gain to anybody.

1137. But at the same time the exhibitor has to pay rather a high price, has he not?—Yes, he has; but, on the other hand, he has no trouble whatever. He has not got to insure his goods, he has not got to look after the transportation, he has not got to store them, he has not got to look after the show-cases; in fact, he has not got the slightest trouble. The goods are taken from his place, transported, installed, and looked after. There is a man to look after them, and, indeed, there are a number of people looking after their commercial interests. They try to stimulate trade, and they look after the interests of the exhibitor in every possible way; and when it is figured out what it will finally cost him, he finds that probably he has saved half the expense, and has got probably ten times the result, roughly speaking. He has no trouble; simply, he pays so much a metre for his space, and his goods are displayed in the best and most artistic and tasteful way.

1138. Would the Committee favour the goods belonging to their own members?—That is where I think the Government would have to come in, and where there should be Government supervision, so that there should be no preference given to anybody. This French Committee is composed only of those merchants or manufacturers who have obtained not less than a gold medal at any exhibition. They must be legitimate exhibitors; they do not admit any others.

1139. Is that a rule of the Society?—Absolutely. Nobody can belong to the Society unless he has obtained at least a gold medal at a previous international exhibition.

1140. And then he is allowed to belong to the Society, paying a subscription of 25 francs or 50 francs a year?—Yes; the subscription is probably 25 francs, or something like that. It is a small fee, just sufficient to pay the small working expenses. When an exhibition is being promoted the various groups are called together; the merchants or manufacturers of the same class meet, and decide, before it is settled who should exhibit, how much space they want, and how much money to spend, and according to what they think a section ought to cost they fix the prices for the exhibit space.

1141. Are you familiar with the methods in other countries besides France? Do you know anything of the German system, for instance?—I find that several countries, since the establishment of this French committee, have adopted the same system. In Belgium there is a very good society formed, *Le Comité Belgique des Expositions à l'Etranger*. They had a very fine display at Liège, and made an excellent show also at Milan. There is another in Holland, and there are two similar societies, I believe, in Italy; and there is one in course of formation in Japan, in Hungary, and in some other countries.

1142. Are you familiar with the Milan Exhibition of this year?—Yes, I visited it.

1143. Were you on the Committee?—I was only on the General Council.

1144. I suppose you have seen so many exhibitions that you are rather a judge of the comparative excellence of exhibits?—I must say I was not very favourably impressed.

1145. With the Exhibition as a whole, do you mean?—The Exhibition as a whole was very good.

1146. With the British Section, then?—Yes. I do not believe anybody is to blame; I think it is simply the system that is to blame. The Commission did all it possibly could to get the exhibitors to come together at the last moment, but it was almost impossible.

1147. Do you think that our failure or comparative failure was owing to our being too late in getting space, or in getting exhibitors?—You have just drawn my attention to a point about which I may be able to give interesting facts. I have made some inquiries from this French Committee with which I have been connected for some years, and they told me that when it was first mooted that there should be an exhibition at Milan they sent a deputation at once to that city. That was two or three years ago. Their deputation saw the Committee there and said, "If you will give us so much space, and the best of it, we will take so many thousand metres, but you must give it to us at our own price." Their own price was a nominal figure, 1½ francs per square metre. They were absolutely in a position to command the price, as against the Milan authorities, and they virtually said, "If you do not give us this you will not have an exhibition, because we will not participate." So that, owing to their being organised, they have been able to be the first ones on the spot, and command terms, whereas we, by the time we have become organised, are too late, and have to take what the other nations leave.

1148. What is your suggestion for remedying that?—There is only one possible means of doing it, and that is to have an organisation on the lines of the French Committee formed as soon as possible. Give them the material to work with, and place them in a position equal to that of other nations. If there is an exhibition going to be promoted, the French and the Belgians send their Committee to the spot; let the British send their Committee also, and unless they get equally good space and on equal terms with the other nations, let them simply say as the others do, "We will not take part in the Exhibition."

1149. Would you let the Committee decide whether a given exhibition was worth participating in?—They would be the very people to do that. They would send a committee of inquiry ahead to study, who would investigate that, and they would advise the general committee or the Government whether it was worth while to participate in the Exhibition.

1150. Do you know anything about the German system of exhibiting?—I do not know it very well, but from what I saw of it at Liège I do not think it is so well organised as the French.

1151. Of course, you are aware that it is much more purely a Government system, the principle being Government selection by Government officials?—Yes. The general result is not so good as under the French system.

1152. Would you take that to be due to the difference in the organisation?—Yes.

1153. Have you formed any idea as regards the arrangement of exhibits by classes, or by the country that exhibits?—I think they should be grouped by classes. It is very difficult to group them by countries, because doing so brings all your exhibits to a certain extent into confusion—I mean as regards a large exhibition, and I am not talking of a small exhibition now. If you bring all your different classes together it looks rather like confusion, but if you group them by classes you can make a very nice effect by having a special court for some particular group or some particular class.

1154. Do you think that exhibitors mind their goods being put in juxtaposition with similar goods of foreign countries?—I do not think that should be done. I think British exhibitors should always have their own group together, in their own court.

1155. Then, you would not put the exhibits under classes?—In the general group of the section they should have their own class, but they should not be mixed with the exhibits of other nations.

1156. If there was a piano being exhibited, you

would not put German pianos, say, anywhere near the British pianos, would you?—The British pianos ought to have their distinct court, and the public ought to be able to distinguish them by going into that separate court, which should be enclosed with a very nice and graceful entrance. When the public go into the British court they should see nothing but British pianos, although the court would be in one building which was altogether devoted to music, and would probably contain in other courts the pianos from other countries.

1157. Then, you would have a separate building for the class, would you?—Yes.

1158. But you would make a distinction between the exhibits of the various nations?—Yes.

1159. Have you seen much of collective exhibits?—Yes.

1160. Do you think the system has answered?—Quite. The greatest result possible is attained by the collective exhibits.

1161. As regards the prizes, what do you think about the present system of medals?—Here we come to a point where I think the British exhibitors are under a great disadvantage. In other countries—let us take France, for instance, because I have more knowledge of the French arrangements—the Government not only gives a large money grant to start the work, but there are other inducements, such as honours and decorations, which the French Government gives to their exhibitors. There are certain manufacturers who have no interest whatever in exhibiting. They are full of work, and they do not want advertisement. But the French section would not be complete unless these people do exhibit, as they are the best makers. As their factories are full of work and they have no interest in exhibiting, the only inducement to get them to exhibit is that there is some honour which may be given to them.

1162. What will that honour be?—I have brought a little list with me of the decorations which have been given in France in 1855. (*Handing in same.*) It shows that the Government treat their exhibitors in the highest possible way. This list is most interesting, and I secured it expressly from Paris in order to show you. These honours are given particularly to those exhibitors who are necessary in an exhibition, without whom it would not be a success, but who themselves have no material interest to be in it.

1163. Do they get them to exhibit by giving them the Legion of Honour?—No. They do not get the decoration at the first exhibition or the second one, but they have hopes that by exhibiting in several exhibitions they probably will get decorated.

1164. I see this list ranges as far back as the Paris Exhibition of 1855, and comes down to the Liège Exhibition of 1905?—Yes. It shows the number of *grands croix*, *grands officiers*, *commandeurs*, *officiers*, and *chevaliers*, which are granted. At Liège, for instance, you see they gave 151 decorations.

1165. May I take from you that these decorations are given simply for exhibiting? Are they not given for other qualifications, as, for instance, for being very large employers of labour?—Yes, and some because they are on the jury; but the greatest proportion are given for exhibiting.

1166. Anyhow, all these decorations have been given to French exhibitors in the exhibitions enumerated in your list?—Yes.

1167. Taking the French Exhibitions, I see that 171 decorations were given in 1855, 230 in 1867, 400 in 1878, 500 in 1889, and 1,169 in 1900; and, in addition, a large number were given to those who exhibited at Amsterdam, Antwerp, Moscow, Chicago, Brussels, Glasgow, Hanoi, St. Louis, and Liège?—Yes. But those figures refer only to the Legion of Honour. Then, there were the Agricultural Orders and the minor Orders. The greatest proportion of all these decorations are given as inducements to pople who really have no need to exhibit, but who are essential for the success of the exhibition.

1168. Are these decorations which are conferred upon people in business used as we here use the gold medal?—No.

1169. Are they not used as advertisements?—No. It is simply a matter of honour and distinction.

1170. Will it not help them in their business to have secured the Legion of Honour?—No. Very few of them would advertise it. It is considered a great distinction—I think it is the very life of a Frenchman—to have the Legion of Honour, and he naturally will make great sacrifices both financially and in labour to obtain it.

Mr. I. Kiralfy. 7 Dec. 1906

1171. Ribbons are not worn in this country in the same way?—No, but we have probably other things which replace them and are just as serviceable, probably better.

1172. Do you think the medals or the certificates for getting medals are of value to exhibitors?—I have, I think, some 40 or 50 from Liège for which the exhibitors have not taken the trouble to apply.

1173. 40 or 50 actual medals?—Diplomas.

1174. That is, diplomas entitling them to buy gold medals?—No; bronze medals are presented to them, which they can get gilded or silvered, as given in their diplomas.

1175. You have got a number that have not been claimed, do you say?—Yes, because the exhibitors do not think it is worth the trouble of fetching them.

1176. Do you think a distinction like the Colonial Order of the Dragon of Annam, or the Colonial Order of Cambodia would be more appreciated?—I do not know anything about those particular Orders. Some existing British distinction and some commercial distinction, which might be created, would be certainly a great inducement to those who really otherwise would not exhibit. I am recommending it because I see the advantage of it.

1177. I understand you have not had very much to do with inviting commercial firms to exhibit?—Not apart from Earl's Court (where we had a good many firms exhibiting) and Liège. The difficulty to get them to exhibit in London is very great.

1178. In London the business you have had most to do with is that of making the exhibition very attractive, is it not?—Yes, but also of obtaining exhibitors.

1179. But in the case of the Earl's Court Exhibitions, for a good many years it has been some foreign country that has sent over exhibitors, has it not?—Yes, but we had British exhibits as well. We generally have had part British and part from some foreign country. We always have a certain number of buildings devoted to British exhibits.

1180. Take the Austrian Exhibition of this last year; I do not think that was so, was it?—That was purely Austrian. I do not say these exhibitions have all been international, but we have had some which were really international exhibitions. We have had several where other nations took part in, and where the British participated in besides other nations.

1181. Do you think that of late years it has been these extra things which you have conducted so well which have attracted people more than the exhibits and the goods? Do you think it is the side-shows, as the Americans call them, which have attracted the people?—No. The exhibition that depends on side-shows would be hopeless.

1182. Would it?—Quite.

1183. You think so?—For commercial purposes it would be hopeless. The side-shows are very well as an adjunct in order to retain the people a little longer in the grounds than otherwise would be the case, but the exhibits themselves must attract them.

1184. You think the foundation of an international exhibition must be the exhibits?—Absolutely.

1185. And not the side-shows?—No, indeed not. The side-shows are all very well to help in paying the expenses of the exhibition and in keeping the people there longer. If merchants go to an exhibition for the purpose of business they may go round for hours, and become fatigued, but if you can still retain them by pleasant surroundings, music, and attractions of various kinds, there is every possibility that after some rest and recreation they may pay further attention to the commercial and industrial part of the exhibition.

1186. (*Sir James Kitson.*) I would like to ask you, as you have some experience, whether you consider that the heavy manufactures of Great Britain benefit by foreign exhibitions. I call the heavy manufactures marine engines, stationary engines, and locomotive engines, which are very costly machines, you know, to carry and establish. Do you think that those

Mr. I. Kiralfy.

7 Dec. 1906.

manufactures benefit by an international exhibition?—I think they would if they had the artistic surroundings, I mean the decorative surroundings, which other nations have.

1187. When you give that answer, do you consider the cost to the exhibitor of carrying those very heavy articles and mounting them and installing them?—I think in that case the exhibitor should be helped to the greatest possible extent in regard to the expenses. I think where the Government aid towards the expenses should go in the greatest proportion should be just to those exhibitors who bring machinery, the heavy engines, and so forth, to the exhibition.

1188. It might be necessary to do what you suggest, that is, to have a complete international representation, but I am rather asking you as to the individual advantage. Can you tell me any instances where the individual has benefited?—No. I do not think that I have ever inquired into that. Judging from the fact that a certain number of firms of this kind generally follow up exhibitions—going to Liège, to Milan, and to other places, and doing it without any Government aid, it naturally follows that they must have derived a benefit from it. For instance, you will find Armstrongs and Whitworth are at pretty nearly every exhibition.

1189. But you really have no business example to induce me, say, as a man of business to expend the money; you are only giving us a general opinion?—That is so.

1190. I suggest to you that there might be in certain classes of manufacture new developments, such as the applications of machinery to the production of electric power and the applications of electric power. Do you think in regard to those it would be a benefit to the individual?—I certainly think it would.

1191. I would rather suggest to you that instead of giving a general answer you would have to go to a clasification, and that there are individual trades only which would benefit?—Then I think my answer as to that would be that it may be beneficial in one country and at one exhibition, and not to another. What may be beneficial, perhaps, to exhibit at Paris or Berlin may not be so at St. Louis or Chicago.

1190. In the course of your evidence you have said something about having to consider the suitability of the market?—Yes, you must.

1193. Therefore you would not recommend expenditure for a general exhibition without special knowledge?—Certainly not.

1194. You would not recommend the Government to expend its money without having studied the capacity of the market for absorbing the goods that are to be sent out?—Decidedly not.

1195. You suggest that the Government should be very careful in its expenditure in reference to the particular objects that I am interested in, for example?—Yes. I think those considerations would come before the investigation committee which it would be necessary to send to the particular country or place where the exhibition was to be held. Being an independent body, they would advise whether a certain class of goods or a certain manufacturer could participate with advantage or not. Then, if they thought a certain manufacturer should participate, and it did not appear to him to be particularly to his financial advantage to do so, his expenses should be defrayed, as otherwise it would be very costly to him.

1196. (*Mr. Harris.*) I think you told the Chairman just now that you thought the side shows were practically a very small part of exhibitions?—Yes.

1197. Would you follow that up by suggesting that a plain, businesslike, unornamented exhibition is perhaps the ideal?—I would not say that.

1198. You think, then, that there is a point at which decoration has an effect?—I think that to make any exhibition successful you must have music and you must have some other attractions. You must have lectures, and you must have congresses. You must bring people there, and you must entertain them in some way or other. I do not say you must do that as the principal attraction, but it should be a part of the attraction of an exhibition. Of course, the commercial interests and the artistic interests should be the principal consideration.

1199. Imagine for a moment that you have swept most of the side-shows away from Earl's Court, but that you have your lectures, and so forth; do you still think that that Exhibition would form the great attraction that it has been to the West End of London?—For whose benefit—the company which runs the Exhibition, or the exhibitor?

1200. I am thinking of the public generally which makes the Exhibition pay?—I believe the people who come to the commercial part would come just the same, but the general public would not come quite in the same masses; and thus far the company which runs the Exhibition might not find it profitable at all, because these other things help to pay part of the expenses.

1201. Do you think that the British trader generally takes the same view as you? Did you not say that it was rather difficult to get him to send exhibits?—Yes, and I think he is quite justified at the present stage in abstaining from exhibiting.

1202. On what ground?—Because he does not derive the proper advantages which he would have if he were organised.

1203. Then you bring it back to a matter of organisation?—Absolutely. I must always come back to the matter of organisation in order to give the British exhibitor the opportunity to derive proper advantages from the exhibition. I have observed the British sections since 1867, though I was not as much interested in them then as I have been lately. Going to look at the exhibition as a stranger, the British section never made an impression upon me—it never attracted me. Why? Because there was a large show-case *here* and a small show-case *there*, and the exhibitors having paid for their space made the best use of it, and they would not have passages 12ft. or 20ft. wide, because every yard of space cost them so much money; consequently they were reduced to small passages, and had to use as much of their space as possible for the show-cases.

1204. Is not that purely an artistic way of looking at it?—No.

1205. I mean it is not business?—It is business in a certain sense. If you want to attract the public, you must have your goods displayed in such a way that they can be properly seen. If you have a narrow passage such as we had at the Brussels Exhibition, which was about 6ft. wide, and show cases on each side, you cannot appreciate the goods so well as you would in a court where they were nicely displayed and properly surrounded; they do not have the same effect on you.

1206. Had you a British exhibit at Liège?—Yes.

1207. Was that organised under your own control?—The British section was organised first by another gentleman of the name of Cope. He undertook the commissioner-generalship of the section, and I was merely a member of the committee. Shortly before the opening, I think it was about four or five weeks before, Mr. Cope for some reason or other resigned the commissioner-generalship, and the exhibition was secured a certain amount of space—a small, insignificant amount of space at one end of the building. The Committee came to me and implored me to take the matter over. I knew it would be a matter of loss, because whoever took the commissioner-generalship had to bear the cost of any deficiency, and should there be any profit to give it back to the exhibitors. Before I undertook it I wrote, as I mentioned, about 300 letters personally to first-class exhibitors whom we had from time to time at Earls Court and elsewhere—I wrote to only the best ones. The result was that I had about three letters which were favourable. I then, with my sons, worked day and night so as to be able to complete what this other gentleman had commenced. I accepted the position because I knew there was going to be a congress of British merchants and of the Associated Chambers of Commerce and some other bodies at Liège, and I thought it would be rather unfortunate to have an important international exhibition without Great Britain being represented. It was really only for that reason that I undertook to finish what the other gentleman had commenced. But all I was able to do had to be done in the little space at my command. The exhibits which we had I simply systematised, making the passages more direct and doing some decoration so as to make it as attractive as I could under the circum-

stances. But I was not quite responsible for it, as I only took it over a few weeks before the opening.

1208. Supposing you had left it alone altogether and Great Britain had practically stood out, do you think that that would have affected the trade of Great Britain in any way?—I do not know exactly that it would, and I will not say so; but I do not think it would have been a very proper thing.

1209. As a matter of fact were you satisfied?—I think the ultimate result was very good, because we obtained in the British section higher prizes than any other nation, having regard to the smallness of our space and the small number of our exhibitors.

1210. Do you think that was recognised?—I do. In proportion to our exhibitors in that small British section, for which I was only partly responsible, we had 37 per cent. of *grands prix*, France had 15 per cent., Germany 16½ per cent., Belgium 14 per cent., United States 10 per cent., Russia 9½ per cent., and Japan 15½ per cent. I think as far as showing whether we had goods that were deserving of honour we did not do very badly, for we had nearly double the percentage of any other nation. Now of the diplomas of honour we had 27½ per cent., France had 10 per cent., Germany had 14 per cent., Belgium had 14 per cent., the United States had 9 per cent., Russia had 7¼ per cent., and Japan had 12 per cent. Of the gold medals we had 58 per cent., France 22¼ per cent., Germany 35 per cent., Belgium 22 per cent., the United States 25 per cent., Russia 28 per cent., and Japan 39 per cent.

1211. (*Chairman.*) How many exhibitors had we there?—I think 120 or 130.

1212. Much less than the other countries?—Yes, but then you see we did not have the space.

1213. The quality was very good, although the quantity was small?—The quality was very good. I must say that we had taken a great deal of trouble so that the exhibitors should receive proper treatment. A great number of exhibitors did not even have an attendant there to explain their goods. It was left entirely to my two sons and myself. I do not say that we deserve any credit, for we did nothing more than our duty; but at the same time we worked very hard so that the British exhibitors should receive the the honours they deserved.

1214. (*Mr. Harris.*) Could you say that the public generally appreciated that, and that they understood the proportion?—Yes.

1215. You may not have proved it as a fact, but do you think that it was generally understood that Great Britain had made a good show for its size and space?—Individually I think so. Of course I do not say that the general effect was magnificent, because we had not the space or material to make it so.

1216. Were the awards spread pretty fairly as a whole over British trade, or were you very limited in the number of trades that were represented?—Rather limited. We had very good machinery there, and, in fact that which was there was really very good. What I was particularly anxious about, and which I did succeed in, was keeping out the undesirable element which unfortunately is so much drawn into many exhibitions.

1217. What do you mean by the undesirable element?—The bazaar element.

1218. What do you mean precisely by the bazaar element?—Embroidering cambric handkerchiefs and electro engraving with your name whilst you are waiting, and spectacle-testing or eye-testing. Rubber stamps, cheap jewellery, and things of that class.

1219. (*Sir Swire Smith.*) You are in favour of a permanent State organisation for dealing with exhibitions, and under those circumstances you are distinctly in favour of the State bearing the cost, I think?—The organisation I suggest should be under the patronage, or under the supervision of the State, but it must be an organisation of the merchants of the country. I do not mean that the State should organise this special committee.

1220. But you are in favour of the State bearing the cost of the exhibits, are you not?—Yes.

1221. And of course you are in favour of collective exhibits?—Yes.

1222. Under those circumstances the real desire is to obtain the best possible exhibits in every class of industry?—Yes.

1223. And therefore the State, or the organising committee, should make the choice?—Yes.

1224. Sir James Kitson suggested that it would be a very serious matter in the case of large machines, such as locomotives or other steam engines, if the exhibitors had to bear the cost of sending them to places where they might not profitably be sent. In the case of those large things, I presume that if it were considered desirable to have such exhibits the State would bear the cost?—The committee out of the general fund would have to bear it.

1225. In the selection of the products for a collective display I suppose that organisations like the Chambers of Commerce of the country might very properly be brought in?—I think they should be represented on that committee.

1226. I mean that they might be brought in to make, in the first instance, the collections from certain different industries and different localities?—Yes

1227. Have you any idea as to the best methods of getting these exhibits—that is, of securing what you really want? You spoke about the importance of bringing in large or leading firms; of course, it is not a matter so much of the firms as of the goods that you want?—Of course it is the goods we want.

1228. Therefore if the State bears the expense it is very necessary that every facility should be given to people who might not have made a reputation, but who might be younger and more enterprising firms, who would perhaps have good things to show?—By all means. The particular committee of that particular group ought to be the judge of that.

1229. You have spoken about the French Government giving prizes or awards or honours to French firms who exhibit in other countries?—Yes.

1230. And you recommend that the same should be done here?—I put that forward very modestly. I only mentioned it as one of the reasons why the French are successful.

1231. If an exhibition is to be held in some other country in which it is very desirable that certain British exhibits should be seen, would you try and make it worth the while of the firms who could exhibit them to send an exhibit?—I do not believe they would expect any promise, or anything like that, but if a firm exhibited in one or two or three places and made a very fine display, and so helped the British section, I think there should be some honour for them to look forward to.

1232. Then really such means should be adopted as would secure the result desired?—That is it.

1233. (*Mr. Algernon Law.*) In the case of Liège did you have to make personal application to induce these firms to come in after you had written to them unsuccessfully?—Yes, I had to send agents travelling round and soliciting everywhere.

1234. In the case of Liège, the Government gave no grant, I believe?—The answer was that the Government were not then in a position to give any grant. A deputation waited on the Minister, and he said that they could not at that moment spare the money.

1235. Do you think the fact that the Association of Chambers of Commerce was going to Liège had any effect upon the authorities of the Exhibition in giving you a larger number of awards than they otherwise would have done?—No. But it had the effect, I may say, of inducing me to become the Commissioner.

1236. Do you know whether any business followed to the firms who exhibited? Did they gain any increase of trade in consequence?—I have made inquiries, but the exhibitors are very careful, and they will not give any information. I know in one particular case of a firm who are producers of metallic tubing, when the jury went round, one of the jurors gave them a very large order. I was told that at the time.

1237. Was there any heavy machinery at Liège?—Yes.

1238. I think you mentioned that Messrs. Armstrong were there?—Yes.

1239. Do they always send to these exhibitions?—Yes.

1240. Do they send heavy machinery?—Yes.

Mr. I. Kiralfy.

7 Dec. 1906.

1241. Do they find it worth their while?—Yes. There were probably half a dozen or even a dozen firms who exhibited machinery in that section.

1242. Were there other instances?—Yes, there were several firms, but unfortunately I have not brought the particulars with me of the exhibitors in that particular class. I will send it on if you will allow me*.

1243. Do you find that an expensive pavilion is an important part of an exhibition—I mean a pavilion such as we had in Paris, which cost about £22,000?—I do not think that was a very great benefit, having regard to the way in which it was arranged. It had to be done because every other nation did the same thing; but, generally speaking, I think certainly we ought to have something better than there was at Milan. The British Commissioner ought to be represented in a dignified manner in some building of importance. I think a little money justly and fairly expended in this direction at Milan would have been fairly beneficial.

1244. (*Mr. Malcolm Ramsay.*) I should like to ask you a little more as to the benefit which trade derives from exhibitions. I conceive that the benefit may accrue in one of two ways—either generally by the promotion of good feeling or by the actual orders that individuals get. Under which head would you say that we have benefited most?—It ought to be by properly developed commercial relations—that is, by the business done there.

1245. By the actual number of orders that firms get?—Perhaps I may here be allowed to remark that I have made some inquiries on this point. I wrote personally to all the British Consuls in France some time ago, after the Liège Exhibition, because I wanted to know in what way British commerce could be improved in France. Of course, I am not at liberty to mention the names of any of these Consuls; but, generally speaking, they say the great difficulty is that we are not represented by proper salesmen or by proper agents. The representatives of our manufacturers do not speak the language, they do not put forward the goods in the proper way, and they do not advise their principals at home in what manner they could improve their goods so as to meet the demand of the foreign country. The same difficulties occur at the exhibition itself. It is in this direction that I think the organisation which has been suggested could do very much to help commerce. If there is a proper system to bring the goods before the people properly, it makes all the difference. Then it is very seldom that a man who wants to buy can find anybody on the spot to give him particulars. All that could be avoided by organisation.

1246. Do you think that the main justification for participating in exhibitions is the benefit to the individual?—Yes.

1247. Do you think that the individual merchant gets a better advertisement by going to an exhibition than he does by employing his own methods of advertising on his own account, independently?—I think the best possible way of advertising, and the cheapest way of advertising, is in an exhibition.

1248. I should like to know a little more as to your ideas on the part the Government is to play. If an exhibition is an advertisement for the individual trader, ought not that trader to pay the larger part of the expenses incurred by his participation?—No, but I think he ought to pay his due proportion. The actual benefit may not be derived at once, and he individually may not get the benefit for some time or at all.

1249. We have been told that in the case of the exhibition at St. Louis the Government grant paid a large proportion of the expenses of the exhibitors—for instance, the cost of transportation, insurance, and, I think, space; do you think, on your theory, that it is the duty of the State to advertise the goods of an individual free of cost?—I think so, to a certain extent. It ought to be a part of the duty of the commercial department of the Government to help the trade of the country all it can.

1250. Would you say that the Government help ought to go further than providing the organisation which will enable the trader to take the greatest advantage of the means of advertisement offered?—I have prepared some notes as to how the Government grant could be best applied. I think the Government grant should be applied first to organise the body to prepare and elaborate decorations and installations for groups and classes, and then it should be applied to lessen the exhibitors' expenses, but it must be left to the committee to say which exhibitors and in what proportion. Then I think that in most of the cases there should be a contribution towards the cost of space and freight; I think the exhibitors should be helped in that direction. Then there should certainly be in every exhibition a commercial bureau. That is a subject which I have not mentioned up to the present, but I think it is an absolute necessity that a commercial bureau should be attached to every British section whenever British manufactures and industries are exhibited in an exhibition.

1251. (*Chairman.*) There was one at Paris, was there not?—Yes, and it was very successful. Speaking from my own experience, I have gone to exhibitions and have wished to secure certain goods or articles, or whatever it may be and I have found that I have been able to obtain scarcely any information anywhere, except in the case of the last Paris Exhibition. If the British section had a bureau attached to it like the one at Paris, I think it would be of the greatest possible benefit not only in the case of the exhibits which are actually shown, but in the case of other British products which are not being exhibited, because the bureau could give information upon them too. Consequently, I think the Government support would be helpful in this direction also. My last point under this head is that the Government grant should be used in taking our artisans to the country where the exhibition is held. I think that is a very important point, and one which should not be left to be organised at the last moment. It ought to be known that funds would be available as soon as it is decided to exhibit, so that it could be at once arranged in the different parts of the country that artisans should be sent to the exhibition in order that they might learn as much as they could about the manufactures and products of other countries.

1252. Do you suggest that we should accept any and every invitation to participate in an international exhibition?—No. Like this *Comité d'Enquête* in France, there should be a committee of investigation here composed of quite independent gentlemen who have no particular feeling one way or the other, who should go over to the country where the exhibition is to be held and should study the question on the spot, consulting with the Chamber of Commerce and others; then when they bring back their report, it should be considered whether it is worth the while of this country to exhibit or not.

1253. Of course the participation of this country in international exhibitions involves a considerable amount of expenditure?—Yes, it does.

1254. Do you think if the Government wish to spend a sum of money for the benefit of trade, it would be most usefully spent in participating in exhibitions, or in some other form?—I really candidly think that up to a certain amount you could not possibly spend it better than on exhibitions.

1255. Turning to another point, did I understand you to say that the great desideratum at exhibitions is quality rather than quantity?—Yes.

1256. Therefore it is better to spend, say, £50,000 on a thoroughly organised exhibit, which includes only the best firms, than to spend £100,000 on a larger and less compact exhibit?—That would be so; but at the same time you must consider that you may be able to display the better goods to better advantage by spending a little more money and by letting them occupy a little more space.

1257. But more good is done perhaps by a small exhibit of the first-class than by a large exhibit of the second or third class?—I absolutely agree with that. Quality must be the essential. At the same time, you must make an equally large exhibit as the other nations with whom you come into competition. It would not do for Great Britain to be always taking a smaller amount of space than other nations.

1258. (*Mr. Wilson Fox.*) You said just now that you think an exhibition is the best form of advertisement; as a matter of fact, does a manufacturer get much

* The firms were E. Green and Son, Ltd., W. and T. Avery, Ltd., Alfred Herbert, Ltd., Thos. Robinson and Son, Ltd., The Linotype and Machinery Co., Ltd., The Premier Boiler Tubes, Ltd., The United Flexible Metallic Tubing Co., Ltd., Reavell and Co., Ltd., &c.

advertisement out of sending a somewhat expensive exhibit to Milan?—I do not know about Milan. Italy is not a very rich country.

1259. Or to Liège?—Yes, I think a considerable amount of business was done at Liège.

1260. Did many English people go there to see the exhibition?—There was a considerable number there. Then, of course, it would get an advertisement amongst the visitors from other nations.

1261. Is it rather among the foreigners that you think it is such a good advertisement?—Yes. It creates new business relations.

1262. Have you got evidence that it has done so, or are you merely giving us your general impression that it might do so?—I have examined the reports of the various exhibitions, and I have found that in the case of other nations there has been almost always, I will not say invariably, an increase of business after an exhibition. It is only in the case of our own country that it has not had the same effect.

1263. You find the British manufacturer reluctant to show, do you not?—Yes.

1264. Apparently then it is not his opinion at the present moment that this is the best form of advertisement?—That is so. But he holds his opinion because he has not had the same opportunity as the foreigner, and he will not have the same opportunity until he gets organised.

1265. Do you think then that it is purely a question of organisation?—I assure you I have studied the subject most carefully. If the British manufacturer exhibits under the same condition as other nations, it will make the greatest possible difference to him.

1266. Do you not think that some of our large manufacturers would be alive to that, if they thought it was worth their while?—Has anybody taken the trouble to study it?

1267. We have got some very large and powerful manufacturers in this country who thoroughly understand the art of advertisement, I think?—Yes, we have.

1268. Do you not think some of those large firms would have combined and shown abroad if they thought there was business in it?—Probably. At present, as far as I can see, opinion is divided; some say it is a very good thing, and others say it is not.

1269. I should have thought that if there was business in it, the keenness of our own manufacturers here would have led them to adopt the practice. It has been suggested to us by several gentlemen who have been interested officially in exhibitions, that it is such a very good form of advertisement; and, therefore, what surprises me is, that the British manufacturers whose interests are paramount in this matter, have not seen these things for themselves, and have not come to the conclusion for themselves that this is the very best form of advertisement?—Perhaps those manufacturers do not need to go outside for work, perhaps they have plenty to do here. They may just come in the category which I mentioned before.

1270. Do you think that the big ones can take care of themselves, but that you have got to spoon-feed the small ones?—The big ones may have all the work they want, but still their presence is essential in order to make the whole exhibit an effective one.

1271. You have had a great experience in exhibitions; have you ever been really satisfied with the British exhibit in any foreign exhibition?—Frankly speaking, no.

1272. Are you in favour of Great Britain taking part in a very considerable number of foreign exhibitions, or in only a few foreign exhibitions, and then making a good show?—Only in the best ones, and then making an excellent show.

1273. Do you think that if Great Britain took part in too many foreign exhibitions, British manufacturers would get more tired of showing than they are at present?—It does not seem to be the case with the French. They had 7,200 exhibitors at St. Louis, and surely there was no special reason for them to go to St. Louis?

1274. Then do you not think that there would be a danger, if we took part in an international exhibition abroad every year, that our manufacturers might cry a stop?—With organisation I do not think there would, because they would not have the same trouble, nor would they have the same expense.

1275. With regard to the organisation, you do not suggest that in these combined exhibits the British manufacturers should lose their individuality, do you?—No. By a combined exhibit I mean that the goods should be in one court, no matter if the court should be only as small as this room. Each firm should have its own exhibit, but similar classes should be grouped harmoniously together, so as to make them entirely attractive.

1276. I understand that a large firm prefers to show an exhibit, complete in itself, of the whole of its goods; for instance, if you take a large furniture manufacturer, he would want to show his bedsteads and chairs and tables and the rest of his furniture in one exhibit?—Quite right, too.

1277. In your plans for a combined exhibit, do you not contemplate any alteration of that?—Some firms, like those engaged in decoration and in the manufacture of furniture, would have to exhibit separtely, but they would do so amongst classes of the same kind.

1278. I put it to you that some of our large traders would object to show, if the individuality of their firm was in any way destroyed?—And they would receive no advantage whatever from their exhibit, if it were exhibited in that way.

1279. Probably you are the greatest expert on this particular point; do you think an international exhibition, run, for instance, by yourself, could be made to pay without any Government grant?—Not at the start; it would be quite impossible.

1280. Could you contemplate an international exhibition, say in this country, being run so well from start to finish, that it could be made to pay without any Government grant at all?—I do not think so.

1281. You do not think it could?—No.

1282. You do not think that the entrances, and the amounts that would be obtained for the catering, and the advertisements, and so on, would cover the cost?—No. They would have to receive money for the space in which to exhibit in order to pay part of their expenses, and the exhibitor must have support from the Government to some extent, in order to enable him to exhibit properly.

1283. But really good organisation, from start to finish, would, I suppose, decrease the amount that would be required from the Government?—Yes. I have really studied this particular point very carefully, and I think that if the Government would see fit to give an organisation like this, at the start, a sum sufficient to enable them to what I call instal themselves properly, it would be worth doing. They could have a big shed where the exhibitor could place his complete exhibit, like a rehearsal. He would see the thing installed in London, or in his own place, where you could have the show cases and the packing cases, and everything arranged for travelling, just as is done by the French people, only I am going further than the French, because the French have not got a room or a hall where you could see the exhibits beforehand. But if you could have what would be practically a dress rehearsal here before sending the goods to the exhibition, I think we could make the greatest success of it that has ever been achieved. Then every exhibitor without going to St. Louis, or to Berlin, or wherever the exhibition may be, could see his exhibit installed in his own place perhaps, and he could give his directions to the man who, on behalf of the committee, had to take care of them, so that everything could be properly done. In that way he would know that the goods would be properly displayed. I think something of the kind has been done, and very successfully done, in connection with the fine arts at one of the exhibitions.

1284. Do you think the largeness of the grant which the Government is sometimes asked to pay, is partly owing to bad organisation?—If I have been correctly informed, the grant at St. Louis was £150,000, and at the last French Exhibition £125,000. I think those grants were excessive. If you were at the start to give this organisation £50,000 or £60,000, say, to organise properly, I think that finally things would so shape themselves that, like the French, you would not have to come upon the Government for anything, except perhaps fine arts, education section, and agriculture.

1285. You mentioned one other thing that I should

Mr. I. Kiralfy.

7 Dec. 1906.

like to ask you a question about, and that was the selection of goods for particular markets. I understand you would attach importance to that?—I think so, in justice to the exhibitor. It is not fair to make him exhibit goods in a country in which they produce the same goods, but of far superior quality. There would not be a chance of his getting an advertisement over it, or if he does get one, it would be a bad one, and he would get no trade whatever.

1286. Then some regard should be had to the tariff in the particular country in which we are showing, should it not?—Yes, where there is no chance whatever of our doing business, certainly. If the tariff is so high that there is no possibility of doing business, then it would be useless exhibiting the goods there.

1287. You said you thought some money ought to be spent in sending artisans from this country to a foreign exhibition. If money is to be spent in that way, would not artisans from the iron and steel industry, say, learn more by the money being spent in taking them round some of the American shops for instance, and showing them how the industry is being carried on there, than by taking them to exhibitions and showing them the completed article under a glass case?—I think it would be very well spent in both ways. If you could get the Americans to let the workmen go in and study their methods as carefully and as quietly and as long as they would have the opportunity of studying at an exhibition, where a man can stand for hours and hours before a particular piece of machinery, I think it would be very well, and I think it would be money spent to the greatest possible advantage. I have followed this idea up, and thought of the way in which those men would be stimulated. They are the men who really make the inventions and improvements in our goods. If they see something fresh every time, it would help us enormously.

1288. There is one thing I want you to make quite clear; what sort of exhibitions do you think England should take part in—only the large international exhibitions, should you say?—Those principally. The smaller ones must be studied, as I have said, by this committee. The Bordeaux Exhibition, for instance, may be interesting to certain classes of our goods, but it may not be important enough to make a great display advisable, although it may be sufficiently important to make it worth while to send a good show of certain of our goods. It is very hard to define exactly where to participate and where not.

1289. As I understand the result of your evidence, it is this: that with proper organisation, international exhibitions might be made a valuable advertisement for commercial men?—With proper organisation, I feel positive of it.

1290. And that with proper organisation the expense to the British Government need not ultimately be great?—It will become finally almost nil.

1291. (*Sir Isidore Spielmann.*) How long after other countries did England make a start at Liège?—It was at the end that we started. We did not start till probably eighteen months or two years after some of the other countries.

1292. Did you find the chief space occupied?—Everything was occupied.

1293. Was it on account of the late start that you failed to get good space?—It was on account of lack of organisation. If we had had an organisation with authority to go to the spot and investigate the matter at once, I do not see why Great Britain should not have been as well served in regard to space as France.

1294. We have been told by other witnesses that there is a considerable feeling amongst manufacturers that by exhibiting in foreign countries their goods are copied; what is your experience?—I think it is a great mistake. If foreign countries want to copy our goods, they have many means of getting the patterns without having to wait for an exhibition. I know some manufacturers say, "I will not exhibit, because if I exhibit at a certain place they will steal my patterns or steal my design." I am not referring to any particular nation, but if some manufacturer in a foreign country wants to copy an article, he will find plenty of ways to do that, even if the maker does not display it at an exhibition. He will probably send somebody into the factory by payment, or he will try to get patterns of it, or he may look into a shop and get patterns of it there. In that way, long before the manufacturer may have a chance of exhibiting the article at an exhibition, his patterns have been sold in Germany, say, or elsewhere. I think if a man exhibits at once he would gain great benefit from it, because he would have the opportunity of getting business and selling his goods before the other man has had a chance of copying him.

1295. You have told us that you have invariably been dissatisfied with the British exhibits at various exhibitions; does that apply to the art sections?—No.

1296. You did not mean it to apply to the fine arts?—No. I must apologise if it seemed to be so. I will not say that I have been quite dissatisfied, but I will say that the British exhibit has not impressed me. As far as the art exhibit is concerned, I believe our art exhibit at the Brussels Exhibition was the finest that ever was made. When we do produce art, it is produced in a magnificent way, and that we really ought not to exhibit anywhere unless we have an art section. It is a great pity to have British participation without an art section.

1297. Under which department in France does the society of which you have been speaking come; it is not under the Minister of Commerce?—Yes.

1298. If the organisation that you recommend were established here, under which department do you think it ought to be?—It ought to come under the Board of Trade; and if I may be allowed to say so as we have no Minister of Art, I think art would also have to come under the Board of Trade, because the same grant would have to cover art as well as the commercial part of the business. I omitted to say that this committee in France has been so successful that lately a Colonial Committee for exhibitions has been formed similar to the Commercial Committee, and also an Agricultural Committee, so that they have now three committees for these purposes, or you may say four committees—for art, commerce, agriculture, and the Colonies.

1299. You are aware, I suppose, that in France art is not exhibited under the Ministry of Commerce?—No, it is under the Ministère des Beaux Arts, but we have no similar department here, so I presume it would have to come under the Board of Trade.

1300. (*Chairman.*) Which exhibition of modern times would you say has been the best in your experience?—The Paris Exhibition of 1900.

1301. In that exhibition which were our particular failings?—I do not say that we have particular failings. I simply say that our goods are not displayed in such an attractive manner as to draw the attention of the general public and of the probable buyer to them. I am not complaining of the exhibits themselves—no, I am far from doing that; I am only saying that they have not been placed to the best advantage, and that with a proper organisation, and with the same exhibits displayed in an elaborate way, the result would have been magnificent.

1302. You have referred to a sort of rehearsal that we might have of the exhibits here, which should be conducted by such a committee as you have spoken of; that would cost a great deal of money for space in London, would it not?—No. A large hall could be hired, or a large shed could be put up very cheaply, which might serve as the permanent store-place.

1303. Land in London is rather dear to put a permanent store-place on, is it not?—But that is not the case near London. It might be within a convenient distance of London. Should you wish to exhibit, let us say, at Paris one year, the next year, as Mr. Wilson Fox suggested, it might not be advisable to exhibit, and the committee might advise that it is no use wasting money with regard to the exhibit at Bordeaux, say. Then what will you do with your plant? You have a magnificent plant of show-cases, arches, and decorations. Store it all in this place, have a few caretakers, and then, when the time comes for the next exhibition, have everything re-arranged. You have all your cases there, and everything ready, so that you can embellish it again and freshen it up as they do in France, and you are ready for another exhibition.

1304. Then you would have the storage-place outside London?—Yes. I may say, in conclusion, that I think an exceptional opportunity is offering itself to organise this committee. As soon as I found how matters stood at Liège, I came in contact with the French Committee for the purpose. I have approached several gentlemen here on the subject, and they are all very enthusiastic. I have asked the French Committee whether they would give us assistance, and they say they would do every-

thing in their power to assist us; there is no jealousy or anything of that kind, but they will do everything in their power to assist us to form an organisation like theirs. Consequently, we should be in a position at once to gain the results of all the twenty years' or twenty-two years' experience of this French Committee, and could apply that knowledge in starting such an organisation now. What has taken them twenty years to learn, we virtually shall be able to get in one year. I think the Franco-British Exhibition, which is going to be held in 1908, would be the best possible dress rehearsal that the British exhibitors could have.

Mr. I. Kirulfy.
7 Dec. 1906.

FIFTH DAY.

Friday, 11th January 1907.

PRESENT:

Sir Alfred E. Bateman, K.C.M.G. (*Chairman*).
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G.
Mr. Algernon Law.
Mr. Malcolm Ramsay, C.B.
Sir Swire Smith.
Sir Isidore Spielmann.
Mr. U. F. Wintour, *Secretary*.

Sir William Henry Preece, K.C.B., F.R.S., called and examined.

Sir W. H. Preece, K.C.B., F.R.S.
11 Jan. 1907.

1305. (*Chairman.*) You were, as we know, Engineer-in-Chief to the General Post Office, and I think you are a Past President of the Institution of Civil Engineers and of the Institution of Electrical Engineers?—Yes.

1306. I understand that you have been associated as exhibitor, juryman, committeeman, or commissioner with almost every international and British exhibition since 1851?—Yes. I have been associated with the following exhibitions: Paris, 1867, 1878, 1881, 1889, and 1900; Vienna, 1883; Munich, 1882; Antwerp, 1885 and 1894; Brussels, 1883 and 1897; Frankfort, 1891; Philadelphia, 1884; Chicago, 1893; St. Louis, 1904; South Kensington Loan, 1876; Fisheries, 1883; Health, 1884; Inventions, 1885; Colonies, 1886; Chelsea (Naval), 1891; Crystal Palace, 1881, 1884, and 1890; Earl's Court (Annual), Manchester, 1887; Glasgow, 1901; Edinburgh, 1886 and 1890; Liverpool, 1886; and many smaller ones.

1307. You have therefore had a very large experience; and from your experience, I take it, that you have formed an opinion about the value of international exhibitions?—Yes. I go rather away from the idea of an international exhibition being anything connected with business. I have had nothing to do with them as a matter of business, and I have not looked at the question from the business point of view. I look upon international exhibitions as a means by which we have improved immensely the technical and industrial education of the European nations, and especially of our own. I consider that international exhibitions stimulate enterprise, and that they encourage national emulation, international exhibitions advertise novelties, they excite invention, they impart knowledge, and they tend very much indeed to promote the progress of industry, craftsmanship, and art.

1308. You regard the question, then, more from the educational point of view than from the advertisement point of view?—Yes, I look at it more from the educational than from the advertisement point of view, though I think each of them holds an equally important position.

1309. You date back, amongst others, to the London Exhibition of 1851 and the Exhibition in Paris in 1881, you say?—Yes. The Exhibition of 1851 in London was the opening exhibition of all these great international exhibitions. First it was promoted by the Prince Consort. The Exhibition of 1881 opened a fresh field in the electrical industry; it was purely an electrical exhibition, and it has led to all the great developments of the electrical industry which the world has seen since.

1310. Was that because it came after the practical invention of electricity for lighting and power purposes?—Yes. It came just at the end of that period in nearly all new industries, when there is a kind of phase of secrecy, when everybody tries to keep from everybody else the knowledge of what he is doing. That is a most absurd phase, but in the industrial world you find it almost invariably the case in the tentative stage of development of a new industry.

1311. Then, to take another point, I think you consider that international exhibitions tend to promote uniformity of mechanical practice and standardisation?—Yes; and that I think is a very important point. In the first place, these exhibitions have led everybody to see what immense trouble, worry and bother there is in connection with all the things we generally use in manufacture and maintenance, such as tools, screws, wheels, and all those kinds of things, and how necessary it is to make them of one uniform kind and pattern. Therefore I think exhibitions have led generally to the notion that standardisation is much wanted in all these things—industrial, military, and everything else.

1312. Your experience is in engineering, I suppose, chiefly?—Chiefly in engineering and electrical enterprise.

1313. And not so much in art and in taste?—No. Of course everybody takes a deep interest in art; but I have not followed that side of the question in our Exhibitions so much as I have the mechanical details and the development of especially the electrical industries.

1314. Do you think these exhibitions have taught British manufacturers something?—They have taught us all immensely. In my own official position in the Post Office I had a great deal to do with the development of telegraphy, and I learnt a lot from exhibitions. I saw in the exhibitions much of everything that others had done, and it was the idea of finding something new and something good that drove me to pay so much attention to the details of the telegraph developments. It was from one or two of these exhibitions that several of our improvements were brought about.

1315. Can you tell us of any industry which has been affected adversely by exhibitions?—I know of none.

1316. You have not heard of any?—I have never heard of any.

1317. Have you not heard complaints from people whose secrets have been stolen?—I have heard of manufacturers complaining that their types have been copied, and that in consequence they have lost business. But that has always cut two ways, because the very man I have in my mind in particular who complained bitterly of this did not hesitate at all to accept a great improvement in detail that he had himself seen at the very same exhibition, and he adopted it without giving any consideration whatever. Therefore, clearly it cuts both ways. Then, again, it must always be remembered that everything exhibited is in the market, and that if a foreign firm wants to get a British

Sir W. H. Preece, K.C.B., F.R.S.

11 Jan. 1907.

machine of any kind as a pattern, it has merely to buy one, and then it gets the very machine itself to copy.

1318. But surely it is easier to see many machines and take what you like from all of them, than to have to find out the special one you want and buy that?—No. To make a machine, or to copy even the details of a machine, you must know the actual dimensions, and you must either have exact copies, or you must have patterns, or you must have drawings, or you must have the thing itself. When a machine is in the market, and a man can purchase it in the market, he will not take the trouble to get the drawings, or even have drawings made in an Exhibition. There is no doubt that the agricultural machinery people of this country complained bitterly of exhibitions for the very reason you have suggested. They have lost the trade. It is growing up again a little bit now in France, I believe; but practically you may say that the agricultural engineer here—that is the engineer who supplied the locomotives, boilers, ploughing machinery, and things of that sort—has lost that business on the Continent. But that is not in consequence of exhibitions; it is in consequence of the people themselves being able to get either by their own purchase or by the machines being used by their neighbours, the opportunity of copying these machines and taking models.

1319. In your *précis* you speak of exhibitions as intensifying advertisements and education; what do you mean by that?—I look upon it that the great moving forces of commerce and industry in the present day are really advertisement and education. There is a great fuss made about our backwardness in this country in technical education, but I do not think we are behind the world in technical education.

1320. I am glad to hear you say so?—On the other hand, I think we have led the world a great deal in that line, and even in the very worst case brought up against us, that is, the electrical industry. Where we are behind the world, and where we are behind every other European nation, is in commercial education. The German in commercial ways and commercial modes of business is far ahead of us. That is not because he is technically better educated than ourselves. The German business man is so much ahead of us because he has got a very much better method of carrying out his commercial business. That is why the Germans are carrying away the trade from us so much in the Colonies.

1321. You think the Government ought to support these exhibitions, I understand?—Yes; upon the grounds that I have just given.

1322. Should not the manufacturers who benefit by the advertisement pay most of the expenses?—Certainly, and they do to some extent. In the first place, no manufacturer can exhibit without expending a considerable sum of money, and without the manufacturers we should never succeed in having an exhibition worth calling an exhibition. But on the other hand, it must be remembered that if a manufacturer spends £1,000 or £2,000 or £5,000 in exhibiting, he would have to pay much more if he advertised in the technical journals and in the newspapers, for that is a very costly business. I can name a firm which spends as much as £100,000 a year in advertising.

1323. That is advertising in technical journals, and so on?—Yes.

1324. And the exhibition, you say, is a cheaper advertisement?—Certainly it is cheaper. It is not such an effective mode of advertising amongst your own people, but it is effective in advertising throughout the world.

1325. You attach importance to Government support?—Yes, very great.

1326. Because, as you say in your *précis*, private exhibitions are more in the nature of entertainments?—I think all exhibitions have very much the character of entertainments. Take, for instance, the last Exhibition at Paris; I should say 99 per cent. of the people went there, not so much for the Exhibition as for Paris and the amusements of Paris.

1327. But do they not get benefit or instruction, even when they go from a light motive?—There is no doubt that there is a great tendency at the present day to combine amusements with exhibitions—perhaps rather too much.

1328. Then you attach some importance to the political side also of exhibitions, and to their being made really international?—Yes, I do attach very much importance to that. I think it brings about a very warm feeling between different nations.

1329. In your *précis* you say that "the Americans are perfectly aware of the immense benefit to them as a nation of international exhibitions"?—Yes, I mentioned that particularly, because I think that the American Government assists immensely all those who are promoting exhibitions in their various big towns. That was certainly the case at Chicago and at St. Louis. They do not go to the same extent in giving financial support, but they assist; although how far I do not know. They throw the ægis of the Government over all the arrangements of the exhibition, and the result is that when the work connected with an exhibition is assisted by the Government at home, all other Governments pay a heed to it, which they do not do, or would not do, if it were promoted merely by private enterprise.

1330. But the American Government, as a Government, has not subscribed largely, has it?—They have subscribed as much as has been necessary. I dare say Sir Isidore could answer that better than I can. I should also say this with regard to Government support in this country—that we do not look quite so much to the Government for financial aid, because we have not been accustomed to it. We have been rebuffed very often. For instance, take the Exhibition of 1881. It was entirely a new idea to have an exhibition like that for electrical purposes, and the Government absolutely refused to help us in any shape or form. They did not form a Commission, they would not take it up, and they did not subscribe anything. The Institution of Electrical Engineers, then called the Institution of Telegraph Engineers, took it up. We formed a committee, we got support from manufacturers, we got together money, and we practically started the whole thing. When we found that every other Government had taken it up, and that we would probably fall into the background in courtesies if we were not supported by our Government, we managed by a little pressure to get the Government to agree to the appointment of a Commission. I think the Exhibition opened in May, but we did not get our Commission until June. Lord Crawford was the chief of it, and Lord Crawford was everything to us during the Exhibition.

1331. But that was only an electrical exhibition, I think?—That was the Exhibition of 1881, and it was only electrical.

1332. That brings me to a point that I wanted to put to you: Do you think that in the future specialised exhibitions will take the place of general exhibitions, and do you think that there is a greater advantage in having specialised exhibitions?—Yes. I can see that that is coming. I can see that the various new industries are themselves rather aiding and abetting these special exhibitions. You can see it at Olympia. We have had the Motor Exhibition, and we have had a very successful but small Electrical Exhibition; but they were purely business concerns, and there was nothing national about them. The Electrical Exhibition in London two years ago was very successful, but it affected London only, although it has been followed by exhibitions in all our big towns, which were equally successful. Those were special exhibitions dealing with one branch only of industry. When you come to all national industries, then exhibitions must be limited. The Exhibition of 1851, which embraced everything, is impossible now, the whole field of industry has become so very great. But an exhibition which could be limited to certain big fields would deserve some consideration. I doubt much whether, having regard to the great growth of the business of the world, an international exhibition like that of 1851, is possible.

1333. Am I to take it that you are rather in favour of an international exhibition of one single group of industries?—Or of a few limited groups.

1334. That is, of two or three or perhaps several of the principal groups?—Yes.

1335. You feel that industry is so tremendously specialised now that you would get an enormous exhibition if you included everything?—That is exactly my view. Engineering, art, and manufactures generally are three great subjects deserving consideration, but when you come to the industrial arts like pottery, silk, clothing, and things of that kind, it is very question-

able whether you can combine them together on a large scale.

1336. You have told us that you think there is a tendency for foreign countries to make their exhibits national?—Yes, very much so.

1337. Does that mean to the exclusion of the products of other countries?—No. What I mean is this: I think it was the case, certainly in Chicago, that all the other European Governments made a collective national exhibition of the products of their own country, and we did not. We have never made a collective exhibit, if I remember aright. I think we tried to do it, but it was a failure. The Germans and the French made grand collective exhibitions; they formed a little French exhibition and a little German exhibition, showing the principal manufactures and industries of those two countries.

1338. You are in favour of the collective form of exhibiting, are you?—Yes.

1339. Either of a district or of a particular class of goods, I suppose?—Certainly. We on a small scale here, would have a Lancashire division, a Yorkshire division, and a Scottish division, for instance. We could divide it into those collective forms. If we went abroad—if there were another exhibition in Paris, say—we would make it a collective British exhibit.

1340. Are you aware of what the Germans and the French have done in getting up exhibits on their system as compared with ours?—No, I could not give you any of the details. I have never been mixed up in the general arrangements of any of these exhibitions. I have always acted on the committees dealing with the engineering and the electrical part.

1341. But in those have you had a general collective exhibit, or have you let people exhibit as they liked, and in their own names?—Speaking purely from memory, I do not think we have ever had anything in the way of a collective exhibit.

1342. You have merely asked the chief firms to exhibit, and they have done so in their own way?—Yes. We certainly tried it at one of the exhibitions, but I forget which it was.

1343. You said some time ago that you were dissatisfied with what happened in 1881, as the Government did not appoint a Commission early enough, and so on; but can you give us any suggestions for improvement, or are you satisfied with the Government procedure in regard to exhibitions since?—I am satisfied; I think it has been working very well. The general rule is to appoint a Commission, and I think in all cases there has been a kind of General Commissioner appointed. The Commission itself has been broken up into committees, and we have always had extremely active committees, the success of all our exhibitions having been due to the activity of the committees—in my experience, generally due to the activity of the chairman of each particular committee. That tends very much to show that exhibitions are more likely to be managed well when the management of the different sections is rather individualised and placed in the hands of an experienced man. In several instances we have had considerable friction owing to there being too many cooks at work. My idea for the management of any future exhibition would be to have a Royal Commission first, and then to have a general manager—give him whatever title you like—and then to have the different sections worked by well-selected experienced men, who might choose their own chairmen, or the chairmen of the particular committees might be selected by the Royal Commission. To my idea, with Government funds, that is the way to manage an exhibition.

1344. Do you attach importance to there being a Royal Commission?—I think there is a good deal in that; first, because it secures the sympathy of Governments abroad, and, secondly, because it is the only way in which the Government and the country can reward the men I am speaking of—that is, by giving them honours.

1345. Do you think that a certain amount of honours are necessary for an exhibition?—I do think so. I think it stirs everybody up a little bit. We all like to have letters after our names; and that is the only mode or way in which it is to be done in this country. I put great value upon that.

1346. Do you attach much importance to the pavilion or other expensive local habitation that we have had at several exhibition—at Paris, for instance?—It costs a large amount of money, and it is very questionable whether it pays for itself. But, on the other hand, there is no doubt that it has afforded immense satisfaction, especially in America. There is nothing that we ever did which I think pleased the American people more than presenting them with those buildings that we had at Chicago and St. Louis. I cannot say anything of St. Louis, for, unfortunately, I was not there, as I was ill and could not go; but I can speak of Chicago, and that building is there still, being used as a club, I think. It is a very handsome building. Everybody from Chicago that I have met had something to say about this building of ours. It has pleased them all immensely.

Sir W. H. Preece, K.C.B., F.R.S.
11 Jan. 1907.

1347. And you think it remains as a sort of gigantic advertisement for us?—It is more than that. It is a very delicate way of giving a present for attentions shown to us.

1348. A return for hospitality?—Yes, a return. I do not think it is a bribe, I think it is a very pleasing way of expressing satisfaction.

1349. But you grant that it is expensive, do you not?—I grant that it is expensive.

1350. It cost £30,000, or something of that sort?—Yes. It did not matter in the case of the St. Louis Exhibition, because there, I think, we ended in having good surplus, or rather not a surplus, but a balance in favour of the Government.

1351. I am afraid the Treasury would not take that view; they would like it all back?—I think one of the most foolish things on the face of the earth is to go and return the Treasury any money they have once allotted for a given purpose.

1352. Would you not rather return it than spend it upon anything which was not necessary?—There were many ways in which that money might have been spent, and properly spent. It is the tendency to be economical that interferes very much with exhibitions. On the other hand, of course, you may be too extravagant, and there is no doubt that in the past there has been a good deal of extravagance.

1353. You do not altogether favour an international exhibition in London, I think?—For the reason I have mentioned before, namely, that it would be so gigantic. I consider that the great success of the Exhibition of 1851 was its proximity. It was centred practically in London. We have got no such place available now. We could not possibly apply Hyde Park to Exhibition purposes. With this exhibition coming on next year, the Franco-British Exhibition, we have to go and take land down at Shepherd's Bush. If there is one feature to make one fear of success it is the difficulty of getting people at night to go to a distance. You have seen the effect in the Crystal Palace; the Crystal Palace has never been a success. You have also seen the effect even at Earl's Court, which is very near, but the exhibitions there have not been great financial successes. If you consider the establishment of a large international exhibition here, you must consider that the one great prospect of financial success would be proximity to the centre of London.

1354. You rather favour international exhibitions in London for a single class of industry, such as auto-motors or electricity?—Certainly I do, very much indeed.

1355. And that is done at present by private enterprise?—That has been done entirely by private enterprise.

1356. And you do not see why it should not continue to be so; is that the case?—You know the purses of the manufacturers are not always full, and it is difficult sometimes to get money from them; so that you cannot always expect continued support from private enterprise. But a large international exhibition, however limited, if made, say, in 1911, which will be just 60 years after the 1851 Exhibition, would certainly get great support.

1357. By "limited" do you mean that it should be limited to certain classes of industry?—Yes.

1358. You appear to be fairly well satisfied with the present machinery for exhibitions; but there is no permanent machinery for exhibitions, is there?—There is no permanent machinery, and there is no permanent department to deal with the matter. The Board of Trade practically, I think, at the last two exhibitions took the lead, but you would know about that better than I do.

Sir W. H. Preece, K.C.B., F.R.S.

11 Jan. 1907.

1359. Do you see any advantage in our having some small permanent organisation, so as to have a continuous policy in regard to taking part in exhibitions or not?—Yes. I think that in one of our departments, say the Board of Trade, there certainly ought to be some such organisation.

1360. Do you think the Board of Trade would be the best department?—I think the Board of Trade is more in touch with industries and manufactures. Even its name, "Board of Trade," has something to do with the point. I think that is the only department that could do it.

1361. On the whole, you think the Royal Commissions have worked well so long as they have got hold of the right men as chairmen of committees to help them?—I cannot conceive of anything better than a Royal Commission on small lines, supported by the Government and assisted by well-selected, able, and experienced men, for they are, after all, the men who do the work, and they are the men upon whom the success of the thing depends.

1362. (*Sir Swire Smith.*) Do you think that another great international exhibition for this country would be a success?—I think the time has now come for one. I was very much disappointed that we did not have it on the fiftieth anniversary of the exhibition of 1851; but the sixtieth anniversary comes in 1911, and I think really the time has come when we in England ought to have something in the nature of an international exhibition.

1363. You think, at any rate, that each generation should have a chance of seeing what England can show?—I think so.

1364. Would you recommend that that should be largely supported by the Government?—Yes.

1365. With regard to sectional exhibitions, would you say that these should be generally supported by the industries themselves that promote them?—Yes.

1366. And would you give no help from the Government to those?—No; I do not think it would be needed. I think if the Government took in hand the entire administration (and it was a strong administration), that the industries themselves could support financially anything approaching a collective exhibition which should be managed by themselves through committees.

1367. Then, generally speaking, you would leave the sectional exhibitions to the industries, and the Government should support our own great international exhibitions, or any other international exhibitions in other countries in which we are represented?—Yes. But I should like to say that my views are entirely confined to the engineering and manufacturing sections. For instance, we cannot expect art to support itself financially; art would certainly require aid from the Government. Then in regard to everything in the way of military display or connected with the industries of the Government itself, telegraphy, for instance, nobody but the Government could make an exhibition of those things. So that the Government would have to appear first as the general parents in charge of the whole thing, and next as supporters of the different Government Departments who figure very largely as great industrial employers.

1368. What is your view with regard to the selection of the exhibits that should be sent from this country to any foreign exhibition?—I have not given much thought to that. Of course there are many specialties in this country, and British manufactures of various kinds. For instance, take steel, for which Sheffield is such a great centre. Then you can take all the cotton and woollen factories of Lancashire and Yorkshire; and the Potteries. All those places, of course, could form collections of their own, which should be supported by themselves and managed by themselves.

1369. That is the point—whether they should be managed by themselves, or whether they should be managed say from the Government?—I think we must take a lesson from the foreigner there. In all cases even the foreigner has left the manufacturers themselves, as far as I remember, to be a kind of committee to manage it. We should certainly have to do that here.

1370. You think the Government should supply the money and allow the local industries to make the choice?—That is so to an extent.

1371. Have you not heard that there is a very strong feeling on the part of many manufacturers in the north that the exhibition of 1851 really did great harm to this country?—There is no doubt it did much harm to a great minority who had practically the monopoly of certain businesses; but, on the other hand, it opened everybody's eyes to the fact that the other countries had other businesses which we had not in this country, and they were tempted to come to this country. There were many different industries developed here after the exhibition of 1851.

1372. You express a very strong opinion then that the exhibition of 1851 did us good and not harm?—Yes.

1373. I think you said you did not know of any industries in which any harm had been done?—I cannot recall any one industry that has been injured by the exhibition of 1851; but, on the other hand, if I took the trouble I could mention twenty or thirty different industries which have been absolutely inaugurated and developed in this country through the exhibition of 1851.

1374. That is to say, through exhibitions we have really learnt much more from the foreigners than they have learnt from us?—Much more. I have always felt that we lived absolutely in a fool's paradise before the exhibition of 1851. In the exhibition of 1851 one of the most beautiful exhibits in the building was the exhibit of the Zollverein. That is a long time ago, but I can see it before me at this very moment. It was the most beautiful exhibit I have ever seen. We have never seen anything better. It was an exhibit put there by the Germans, and it was a strictly collective exhibit. Of course, I was only a boy in 1851, but it impressed me very much indeed.

1375. You mention one or two points with regard to our great lack of commercial education rather than of technical education; of course, we need not go into that question fully, but would you not consider that commercial education is merely a branch of technical education? Is it not the technical education of the commercial man?—Yes. I take technical education to really mean training the brain to help the hand. I will add more than that—it is training the brain to help the tongue.

1376. Do you not consider that we have been very much behind in the technical instruction of our textile manufacturers?—We have been terribly behind, but where we are so behind is really in the development of trade. I can speak with great experience of this, for I have to deal with more or less nearly all the colonies. There is not a single day that I have not to deal with tenders or indents. The way in which the American or the German deals with his business makes me ashamed of my countrymen.

1377. (*Sir Isidore Spielmann.*) You say you think that Royal Commissions work well?—My experience is that.

1378. And that British interests under Royal Commissions fare well?—Yes.

1379. Do you not think that the delay occasioned by the formation of Royal Commissions is distinctly detrimental to our making a good exhibit at international exhibitions?—I am very much afraid it has interfered with us in the past a good deal. That is due very much to the fact that all these different Commissions have been made up of different individuals who have not had previous experience. What I tried to imply before was that we rather want experience; and there is no doubt you would secure that by having a Government Department whose business it was to look after exhibitions.

1380. You have referred to your having tried to form a collective exhibit, I think you said at Chicago, and that you failed. Had your failure anything to do with the want of money, or was it due to the ignorance of the would-be exhibitors, who did not understand the meaning of collective exhibits?—I think it was due entirely to the jealousy of manufacturers. There is great jealousy amongst manufacturers, and it is the most difficult thing in the world to get them to pull together. We are getting very much better now. We have had a considerable amount of experience in that direction with the committees that are now at work dealing with the question of engineering standards. In our Standard Committees, which are really managed by engineers, though supported by the Government, we have brought manufacturers together very much, and when once you bring them together we find they work splendidly. But unless they are well handled, this jealousy, which they cannot resist, will interfere, as it has interfered in the past very much. However, with our experience now, I should be inclined to say

that if any attempt were made to form collective exhibitions they would succeed, for manufacturers themselves are beginning to see that it is foolish to be so jealous.

1381. Do you think the Government grants have been sufficiently large in regard to British exhibits?—They have been very meagre in the past, but I think we have every reason to be pleased that they have been of late as much as they were. Our experience at Paris was lamentable in 1881, but I do not know that since we can complain of the Government. Of course, we should only be too glad to have more, but then you see in connection with St. Louis we had to return something.

1382. You are not in favour of spending large sums of money on our pavilions, and then presenting them to the nation on whose soil they happen to be erected?—No. If there were another foreign exhibition I should be rather inclined to hesitate at spending so much money upon these buildings. There is no doubt that it paid at Chicago, and it may have done so at St. Louis, but I cannot say. Those, however, are the only two places where we can well say that they have acted as presents, or as returns from us for the courtesies we have received. In Paris I do not think we have ever done anything of the sort.

1383. But you think in those cases we were repaid by securing their gratitude?—I think so.

1384. Then, with reference to the copying of exhibits, did I understand you to say that you consider the copying of our machinery or other things is the natural result of trade, and not the result of the things themselves being exhibited in exhibitions?—Distinctly so. I am perfectly satisfied on that point; I have no doubt about it.

1385. If we were to have another international exhibition in London, would you be in favour of stripping the exhibition of amusements, side shows, and so forth, and of making it solely educational and commercial?—We have never done otherwise, I think, in England; we have never attempted the side shows. It was in Paris and Chicago were the side shows were so marked. An exhibition in Paris without side shows would scarcely be acceptable, because it is looked upon as part and parcel of an exhibition there; but in London it is not expected, and we could do without it.

1386. I think you said that you do not consider an exhibition would pay unless we could bring people to and from the exhibition at night time with ease?—I look upon that as a very important point indeed.

1387. Are you aware that at Paris and at most other large exhibitions the buildings were never opened at night time, and that the people merely came there in the evening for the amusements, the music, the promenades, the cafés, and so forth?—I had in my mind the exhibition of 1881. In the evening there were always great crowds there. It was lighted up brilliantly for the first time in history by electricity, and certainly the evening audiences were the largest and the most pleased.

1388. You have forgotten that since then it is no longer the custom to open the exhibition buildings after dusk?—Was that the case in Paris in 1900?

1389. I think so?—I do not remember.

1390. (*Mr. Malcolm Ramsay.*) When you were speaking about the cost incurred by exhibitors at exhibitions you said that some might spend £1,000 or more; would these expenses fall as heavily on exhibitors in the case of exhibitions for which the public exchequer here has given a grant?—No; any grant from the exchequer here would tend to reduce the necessary expenditure of the exhibitor. What I said was that a manufacturer could make a splendid show, and use the exhibition as a magnificent advertisement, for £1,000, whereas if he were to depend upon the public press and technical journals to advertise his wares, he would have to spend ten or twenty or thirty times as much.

1391. Taking, for instance, the St. Louis Exhibition and the last Paris Exhibition, was it not the case that the exhibitors were relieved of all the expense of space, and a good deal of the expense of freight, by the public exchequer?—That is so.

1392. Do you think that in future we could legitimately ask manufacturers who exhibit to bear those expenses for themselves?—No. That idea had not occurred to me.

1393. If it pays an exhibitor to advertise in the form of an exhibition rather than in the trade journals, could he not afford to pay a larger proportion of the expenses, and so relieve the charge on the public?—I think, myself, that the payment of transport to and from is a very great inducement to get the manufacturers together, and that without it we never could have got an exhibition at all for St. Louis or for Chicago. In the case of the last Paris Exhibition I think we paid only one way—I cannot recall quite what we did, but I know that the question of transport was a very serious one, and I think we had to pay the transport one way, certainly.

1394. Then I may take it that in spite of the great advertisement which the manufacturer gets at exhibitions, you are not in favour of letting him pay all his expenses in the case of exhibitions which are supported by a Government grant?—Certainly not.

1395. Are we to understand that you attach more importance to the fact of an exhibition being officially recognised than to the actual financial support which the Government gives it?—I cannot imagine the one without the other; but as far as the managers are concerned, and as far as the moving spirit of the whole thing is concerned, I think that Government support and Government honours have more influence than any financial reward, whatever it might be.

1396. You said just now that the organisation under Government patronage was more effective in dealing with the representatives of other countries; what exactly did you mean by that?—What I meant to imply was that Government support and a Government commission had a very great influence in securing the sympathy of other Governments, and also courtesies, which a mere committee appointed by the industries—by private enterprise that is—could never obtain. Then again, there is the example of every other nation to be borne in mind. We are always exceptional in this, that the Government has only borne a portion of the expense, and has never borne the whole, while in the other countries the Government bears the whole expense.

1397. Do you think that with better organisation the management of the British sections could make more use of the money which the public grants?—That depends upon the amount granted. I think it was a foolish thing to return that balance at St. Louis; we might have expended it in some way or other which would have been useful for future exhibitions.

1398. But are you not aware that that money was granted by Parliament for the express purpose of the St. Louis Exhibition, and no other?—That is quite true.

1399. Therefore it was impossible to apply it to any other purpose without further application to Parliament, and nobody had any power to apply it to any other purpose?—That is quite true; but, on the other hand, that balance was the result of economies which were practically unnecessary.

1400. But no pressure was put on the management to effect economies, was it?—I do not know about that.

1401. The money was paid to the Commission, and I do not think there was any pressure to economise—certainly not from any Government Department that I know of?—I know that I took a very active part indeed in the management of one of the committees, and I was bothered very much for want of money. I speak feelingly over the business. It would have aided us very much indeed if we could have spent more money, I am speaking of the electrical display.

1402. The allocation of the whole grant between the various sections would rest with the central financial committee, would it not?—It did very much, but there was always throughout all our proceedings a kind of desire to show that we were not going to be extravagant.

1403. (*Chairman.*) There was always the fear of the Treasury before your eyes?—Yes, the fear of the Treasury.

1404. (*Mr. Malcolm Ramsay.*) Do I understand you to think that the money, £150,000, which was granted for St. Louis was insufficient?—No.

1405. £150,000 is a very large sum?—I will not say that it was either sufficient or insufficient, because I certainly have not paid attention to that financial side of the question.

1406. Do you contemplate that for an effective display at future exhibitions it would be necessary to give grants on the scale which was adopted at St. Louis and

Sir W. H. Preece, K.C.B., F.R.S.

11 Jan. 1907.

Paris?—Certainly, and much more—as much more as the Treasury would give.

1407. (*Mr. Algernon Law.*) You say that the use of exhibitions is chiefly educative, so that we go to them not to teach others, but to learn ourselves. Could not the same result be achieved by our manufacturers going to the exhibitions without sending exhibits? Could they not learn all that was necessary without showing their own hands?—My view is that the education is not the education of the manufacturer, but the education of the public—of those who go to the exhibitions.

1408. So there is not a direct commercial benefit to be derived from exhibiting at exhibitions?—I do not think it is a great commercial benefit to the manufacturer, except in the light of its being an advertisement.

1409. How do you account for the reluctance of manufacturers to exhibit even when the expenses are more or less paid, as they were in the case of St. Louis? They have to be drummed up, and it is no use writing letters, but people have to go and call on them and implore them to exhibit?—That is an illustration of the want of education, and that entirely supports my view. It is owing to the want of education really, and they do not look upon it as an advertisement in the light that I do.

1410. (*Mr. Wilson Fox.*) You say that "the Americans are perfectly aware of the immense benefit to them as a nation of international exhibitions"; you are referring there, I presume, to the exhibitions which they have held in America?—Yes.

1411. I can understand that it may be a considerable benefit to Americans to hold large exhibitions in their own country, because in that way they get an immense amount of money coming into the country, which is a direct benefit, and their manufacturers also get the means of advertising largely among their own immediate customers; but neither of those direct benefits accrue to the other countries who have to go to America and show there, do they?—No.

1412. So there are two aspects of it?—There are two aspects of it. What I meant to imply was that an international exhibition is good for the nation holding that international exhibition.

1413. And my point therefore is that the Americans would not necessarily be so enthusiastic about an international exhibition if it was held in Paris instead of Chicago?—That is quite true.

1414. The nations that have to send exhibits out of their own country have to look forward to much more indirect benefits, that is to say, to possible medals or prizes by which they may advertise themselves in their own country, or possibly to opening up new markets in the other country?—It is the possibility of new markets that has a great deal to do with it.

1415. Of course, some of our manufacturers not being exporting firms, and not even desiring to go into the export business, have no particular interest in showing?—No; and those are the people who hold aloof.

1416. There are a great many other manufacturers who hold aloof. We have had evidence given before this Committee that there is a very great difficulty in getting manufacturers to show at all, and, in fact, a great expert upon exhibitions, Mr. Kiralfy, informed us that he had never yet been satisfied at any exhibition with the British exhibit. Therefore I put it that it is not generally the feeling among British manufacturers that foreign exhibitions are a good form of advertisement?—I think that refers rather more to American exhibitions, because our manufacturers feel that they cannot get a market in America. I do not think it applies to any of the international exhibitions in Europe, for there they do succeed in getting a market for some of their goods.

1417. Still, we find from the evidence we have had that there is a very great reluctance on the part of manufacturers and traders to embark on that particular form of advertisement; on the other hand, we hear from you—which I have reason to know is accurate—that some of these large firms will spend as much as £100,000 a year in this country in advertisements. Looking at it from their point of view, as business men who may be presumed to know their business, that looks as if they regarded the expenditure of money in this country as more likely to return them something directly into their pockets than the expenditure of money on foreign exhibitions?—That would be a great argument in favour of an international exhibition in this country.

1418. It might possibly be so, but we have not had an international exhibition here for 50 years; and, on the other hand, some of the other arguments which manufacturers have put before us may apply, namely, that they do not wish to show their goods on account of disclosing their secrets?—That might be so.

1419. You were present at the exhibition of 1851, were you not?—Yes, and at the exhibition of 1862 also.

1420. Were you satisfied with the British exhibit in 1851?—It is a long time ago. I was only saying that it made such a deep impression on me that at the present moment I can recall to my mind the Zollverein collective exhibition, which was one of the great features of the place.

1421. (*Chairman.*) Surely you were a very little boy then?—I was not quite that; I was born in 1834.

1422. (*Mr. Wilson Fox.*) At any rate, you will not think it otherwise than as a compliment when I say you were very impressionable?—That is the only thing I can remember, except the tinted Venus.

1423. (*Sir Swire Smith.*) Was not the tinted Venus in the 1862 exhibition?—No, I think not.

1424. (*Mr. Wilson Fox.*) With regard to the engineering firms with which you are acquainted, do you think that engineering firms show at international exhibitions for the purpose of getting orders, or do they show mainly for the purpose of getting honours?—They show for orders solely.

1425. You think that?—There is no doubt about that.

1426. For the export trade abroad?—Yes.

1427. I was under the impression that it was the engineering firms, as much as any class of firm, who refrain from showing, on account of getting their machinery copied?—That has always been a fear with them, but I think that has disappeared. At any rate, I do not believe in the fear of copying.

1428. In the engineering business you do not believe that?—I do not believe in the copying in the engineering business.

1429. You say these exhibitions are technical schools, but is there really much to be learnt in the way of technical education at an exhibition? I can understand that if you go into an engineering shop, or into a manufactory, and see the things made, there is much to be learnt in the way of technical education; but is there much to be learnt in the way of technical education by going to an exhibition and seeing the finished article under a glass case?—I can speak with considerable experience of my own branch. I have gained an enormous number of wrinkles from examining exhibits. I have personally received considerable instruction from the apparatus that I have inspected as a juror particularly.

1430. But that would be more especially with regard to electrical work than anything else, I take it?—I am speaking almost entirely from the electrical point of view.

1431. I think you said that exhibitions are a good thing for working-men, and that they teach them how backward they are as compared with other people?—What I said was that the 1851 exhibition taught us all how backward we were.

1432. As a rule, there are not many working-men who go from here to exhibitions, are there?—Yes.

1433. Who go abroad?—Yes. A good many men went to Paris.

1434. Were they sent by the large firms?—I think towns have had collections and sent men. Many manufacturers send selected men. I am sure I have seen excursions in Paris from Lancashire. I have seen the working-man knocking about abroad a good deal.

1435. Do you think the British working-man when he came back worked a bit harder in consequence of his trip?—He had learnt a wrinkle or two. Of course it is only the smart man who goes.

Mr. BENNETT H. BROUGH called, and examined.

1436. (*Chairman.*) You are, I believe, the Secretary of the Iron and Steel Institute?—Yes.

1437. You are also an Associate of the Royal School of Mines, and a member of the Council of the Institution of Mining Engineers?—Yes.

1438. What has been your experience in connection with exhibitions?—I was juror at the International Inventions Exhibition, London, 1885, and at the Paris Exhibition, 1900. I organised for the Royal Commission of the Chicago Exhibition, 1893, a collection of the economic minerals of Great Britain, and served on the Committee for Mines and Metallurgy of the Royal Commission for the St. Louis Exhibition, 1904, and on the British Committee for the Paris Exhibition of 1889. I read papers before the Society of Arts on the Buda-Pest Exhibition, 1885; the Barcelona Exhibition, 1888; the South African and International Exhibition, Kimberley, 1892; and the Stockholm Exhibition, 1897. I delivered a lecture at the Kimberley Exhibition, and received medals for services rendered at the Inventions Exhibition, the Paris Exhibition, 1900; the Chicago Exhibition, and the St. Louis Exhibition, and was honoured by H.M. the King of Sweden with the Cross of the Order of Wasa.

1439. Have you formed any opinion as to the effect of exhibitions on (*a*) the manufacturing and exporting trades of this country; (*b*) British arts; and (*c*) the general commercial relations between the countries concerned?—I have formed the opinion that international exhibitions have had a beneficial effect on the manufacturing and export trades of this country, on British arts, and on the relations between the countries concerned.

1440. Which, in your opinion, are the particular industries, or classes of industry, that have chiefly benefited by exhibitions, and in what way have they benefited?—First regarding exhibitions as extensive bazaars, I believe that the sales directly brought about by exhibitions have been considerable. It is difficult to state exactly to what extent sales have resulted from the actual exhibit, and to what extent they have resulted from the detailed descriptions of the exhibits published in the technical journals if the world. I had, however, the opportunity of seeing the results obtained at a local exhibition held in Nuremberg in 1896. The outcome of a circular sent to the exhibitors showed that the actual sales effected through this small exhibition were as follows:—

	£
1. Mining and metallurgy	1,793
2. Foods	30,851
3. Textiles	8,072
4. Paper	133
5. Leather	6,614
6. Glass	2,102
7. Clay	1,742
8. Stone	2,997
9. Metal	21,494
10. Wood	21,632
11. Printing	3,922
12. Scientific instruments	3,133
13. Musical instruments	2,126
14. Chemical industry	2,106
15. Building and engineering	3,919
16. Transport	2,448
17. Machinery	55,862
18. Horticulture	143
19. Fine arts	4,061

Experience at other exhibitions would, I think, show somewhat similar results. The largest sales would be of comparatively small metal articles, universally used and in constant demand. Except in the case of striking novelties, the large metallurgical exhibits, that do not appeal to the public generally, would probably not show an adequate direct return for the heavy expenses of installation, and it is probable that the striking displays of the Le Creusot Works at Paris in 1900, and of the various steel works at Düsseldorf in 1902, were the outcome of a patriotic spirit without any hope of an adequate pecuniary return. Striking novelties, however large and costly, are exhibited with advantage. The exhibit of the large engine driven by blast-furnace gas by the Cockerill Company at Liège, in 1905, led to a number of sales in this country; and the comparative trials of rock drills at Kimberley, in 1902, were followed by many orders, as mine-owners were waiting for the results of so valuable and independent a test. Even firms with monopolies find it advisable to exhibit in order to maintain their position. Thus, notwithstanding the American tariff, there were at St. Louis excellent exhibits of best Yorkshire iron, owing to the fact that that material is even in America used for purposes where absolute trustworthiness is of greater importance than price. Exhibitions should, however, be not merely bazaars, but museums of industry and of social progress, too vast for permanence. The educational value is consequently far greater than that indicated by mere sales, more especially in cases where there is a retrospective collection enabling comparisons to be made of old and new methods. From this point of view it is always found convenient to hold international congresses in connection with exhibitions, and such congresses have in many cases had far-reaching effects. Thus the completion of the Postal Union was the outcome of a congress at the Paris Exhibition of 1878. In very many cases exhibitions have resulted in valuable ideas to manufacturers. The following are instances:—

Mr. B. H. Brough.

11 Jan. 1907

(*a*) At the Paris Exhibition, 1900, Messrs. Taylor and White, of Bethlehem, U.S.A., exhibited some high-speed tool steel giving astonishing results, which at once attracted the attention of British steel makers, with the result that before the exhibition was closed Sir W. G. Armstrong, Whitworth and Co., Ltd. (Manchester), were making similar steels giving even better results. Since then still greater developments have been made by that firm and by makers in Sheffield, and results in cutting powers far beyond expectation have been attained. The manufacture of high-speed tool steel has become a British industry of great magnitude, and the British product is even exported to America. There has been no secrecy regarding the improvements, for manufacturers now realise the value of an exchange of ideas. In fact, at the New York meeting of the Iron and Steel Institute, Mr. Gledhill (of Sir W. G. Armstrong Whitworth and Co., Ltd.) gave full details of the composition and properties of the high-speed steel he was making.

(*b*) At the Paris Exhibition, 1900, the Courrières Colliery Company, at whose mines the death-rate from accidents by falls of roof was abnormally low, exhibited models showing the systematic method of timbering employed. The late Sir C. Le Neve Foster, one of the jury, and one of H.M. inspectors of mines, was struck with the value of the method, and induced the Home Office to send a description of it to colliery managers in this country, with the result that the method was largely followed, or sometimes even improved upon, and there was at once an appreciable decrease in the death-rate.

(*c*) Exhibitions add to the knowledge of mineral resources. Systematic collections of economic minerals have resulted in the indication of fresh sources of iron ore supply, and of new fields for British mining enterprise. This is appreciated by Canada, whose mineral exhibits are invariably striking and effective. An exhibit of Indian manganese ore at St. Louis opened up an important market for that material in America. At Budapest, in 1885, no Hungarian mining or metallurgical product was omitted, the exhibitors showing not only specimens, but also maps, models, photographs, and statistics, and in many cases special monographs were prepared. The outcome was that the exhibition did much to raise the Hungarian mining industry from its then depressed condition. Again, the collection illustrating Japanese resources at St. Louis, the most complete of the kind, made evident the directions in which competition had to be faced.

(*d*) At Barcelona, 1888, Great Britain was very poorly represented, the British Court being confined chiefly to lavatory fittings. The French secured much business, but the English manufacturers did not profit by the opportunity afforded by the new Treaty of Commerce for the introduction of British manufactures into Spain.

(*e*) The exhibit of pictures by British artists, apart from actual sales by which artists benefit, has a more permanent effect in encouraging a taste for British art. The pictures shown in the British Pavilion at Paris, 1900, were regarded as a revelation by the French ironmasters, who were my fellow-jurymen, and this exhibit

Mr. B. H Brough.

11 Jan. 1907.

certainly gave a stimulus to art education in France. The exhibit of an English villa of the "Bedford Park" type at Philadelphia, in 1876, had a marked and lasting effect on American domestic architecture, and the working-man's dwelling shown by an English manufacturing firm at Paris, 1900, has resulted in improvement in housing accommodation for working-men on the Continent.

(*f*) As an illustration of the improvement in commercial relations, I may mention that my brother, an engineer residing in Belgium, has found that as a result of the interest taken in British exhibits at Belgian exhibitions, it has been easier for him to secure orders for British firms that he represents, even when they were not exhibitors.

1441. Do you consider that the interests of any industry or classes of industry are adversely affected by exhibitions; if so, which are the industries, and in what way are they affected?—Excepting the interests of the theatres, music-halls, and restaurants, which suffer from the counter-attractions of an exhibition in the same city, I do not think that the interests of any industry are adversely affected. In 1851, when British manufactures stood unrivalled, detrimental effects may have resulted from the wide publicity of the exhibition having enabled competitors to enter the field. For example, the steel then exhibited by Krupp was the starting-point of the development of that firm, which is now the largest in Europe. Nowadays, with the industrial progress that has been made in other countries, Britain's supremacy is not so universally recognised, and exhibitions afford an opportunity to British manufacturers of learning useful lessons.

1442. Do you consider that the direct commercial results obtained by the official participation of this country in international exhibitions have been such as to warrant His Majesty's Government in giving grants for the organisation of British exhibits in future?—I consider that the results obtained by the official participation of this country in international exhibitions have been such as warrant H.M. Government in giving grants for the organisation of British exhibits in future. The refusal of the British Government to participate would be regarded as a slight, more particularly in the smaller countries, where the patriotic spirit is very keen, and might lead to a partial boycotting of British goods. Apart from the question of grants, the actual participation of British Government Departments is of very great importance; for example, in organising comparative exhibits of mineral resources, geological survey maps, and accident statistics, and in showing to the world the progress made in Great Britain in technical and general education. Participation in international exhibitions is the only legitimate way in which a nation can advertise. Experience shows that if a firm desists from advertising in the newspapers, sales immediately cease. Similarly, even if official participation does not appear to be followed by marked advantages, non-participation would, in my opinion, be quickly followed by most detrimental results.

1443. Do you consider that equally satisfactory results could have been obtained by private enterprise?—The results obtained at some exhibitions by private enterprise have been eminently successful, notably at Brussels, 1897, where the wide connections as engineer and as editor of a technical journal ("Engineering") of the Commissioner-General, the late James Dredge, C.M.G., compensated for any slight that the Belgians may have felt at the lack of official participation. On the whole, however, I consider that private enterprise is liable to abuses. There are nowadays many so-called international exhibitions that are run by promoters solely as a money-making device, and it would be deplorable if British representation at a great international exhibition were conducted on the same lines.

1444. Assuming that public money is, in any case, granted for the organisation of official exhibits, do you consider that the grant should be made subject to any special conditions as regards (*a*) the accommodation and facilities offered by the exhibition authorities; and (*b*) the number and quality of exhibits offered by British firms?—I do not consider that grants should be subject to special conditions. Each exhibition should be dealt with on its merits, for obviously conditions laid down for an exhibition at Antwerp, 190 miles distant from London, would not apply to an exhibition at Tokio, 11,000 miles away.

1445. Can you state briefly what have been the methods employed by the British Government in organising exhibits for international exhibitions?—In organising exhibits, the practice has usually been for the Royal Commission to appoint committees to deal with the various groups covered by the exhibition. These committees, consisting of specialists and manufacturers, draw up lists of possible exhibitors, to whom circular invitations to exhibit are sent. Care has also been taken to interest the technical journals in the exhibition, in order to secure their help, which is of very great value.

1446. How do British methods compare with those of other countries, notably with those of Germany, France, the United States, Austria-Hungary, Belgium, Italy, and Switzerland?—The methods employed by other countries are in the main very similar, except that in Germany there is now, I believe, a permanent Commission on Exhibitions. For the Paris Exhibition, 1900, the Commissioner-General was Dr. Richter, of the Imperial Home Office, and the arrangements were made by that department with the aid of an advisory committee of specialists. At Milan, the German Commissioner was the German Consul-General at that city. In Germany much has been done in the way of organising collective exhibits—for example, the collective exhibit of German chemical industry at Paris, 1900, and the collective coal-mining exhibit at Liège. The latter was rendered easy owing to the existence of the German Coal Syndicate. With British exhibitors, collective exhibits are difficult to organise, owing to keen competition amongst the British exhibitors themselves, which militates against the subject being dealt with from a national point of view. At Paris, 1900, it is true, there was an excellent collective exhibit by the Redditch needle manufacturers, but even there there was one firm of Redditch needle makers that had an independent exhibit. At the same exhibition, a leading American technical journal, the "Iron Age," organised a collective exhibit of the catalogues and price-lists of American hardware manufacturers. The fact that the exhibit was organised by a technical journal obviated any jealousy among the firms concerned. In the appointment of jurors, the British methods have proved superior to those followed in the United States, where the position is often granted for political distinction. At the Paris Exhibition, 1900, my American colleague on the metal-working jury was a legal luminary, with no special knowledge of metallurgy, whilst a distinguished American metallurgist was appointed juror for an economic subject with which he had no acquaintance. British Royal Commissions have, on the other hand, always appointed specialists in the subject, with a knowledge of the language of the country in which the exhibition was held.

1447. What, in your opinion, have been the chief causes of success or failure of British exhibits in the past, and in what way do you think that the defects, if any, could be remedied in future?—At the Milan Exhibition, 1906, the British exhibits were a success, owing to the very complete, representative, and well-arranged collection of ship models. In other classes, however, there was the defect that the exhibits were not displayed to full advantage. For example, Krupp's exhibit was at first sight much more striking than that of Vickers, Sons, and Maxim, but when one came to look at them more closely, it was evident that Vickers' had more of interest, but so modestly arranged that the general public was not impressed. The lack of attractive arrangement has been noticeable at many other exhibitions, and even the decoration of the British courts has not been so effective as the French and German. At Milan there were but few British flags, whilst the French and German courts were very artistically decorated. At the Inventions Exhibition in 1885, there were very striking wall-paintings, illustrating the progress of invention. This idea might, I think, be followed, and the decoration rendered instructive as well as artistic. The importance of decoration may, of course, be over-estimated. In the case of undoubted merit the success of the British exhibits has been ensured with decorative aid. Thus, at Paris, 1900, the British locomotives were generally acknowledged to be easily first for simplicity of construction and excellence of workmanship. British exhibits might, I think, be improved if more could be done in the way of collective exhibits. For example, small uniform blocks of coal, with descriptive labels, from every colliery in the kingdom, are of greater national advantage than mountains of coal exhibited by a few rival firms.

1448. Do you consider that any, and if so which, of the methods employed by foreign countries could usefully be adopted for the organisation of British

exhibits?—The German idea of having a permanent commission has much in its favour as it obviates the lack of continuity usual with British Royal Commissions. Mistakes made at one exhibition are apt to be repeated at the next; and the same work has to be done over and over again. Thus, for Chicago, a collection of British economic minerals was formed. A similar collection was formed for Paris, and again for St. Louis. Had the original collection not been given away, it could easily have been brought up to date without writing again each time to every mine-owner in the kingdom. On the other hand, the permanent commission presents the drawback that the Chief Commissioner does not necessarily have a knowledge of the language and of the country in which the exhibition is held. And to ensure full success, it is necessary that the Chief Commissioner should be a *persona grata* in that country. At Milan, for example, it was of advantage to have a commissioner familiar with the Italian language and methods. For this reason I do not consider that the German method should be followed in its entirety.

1449. Do you consider that the appointment of a Royal Commission constitutes a satisfactory method of dealing with the organisation and preparation of British exhibits, or if not, what alternative machinery would you suggest?—I consider that the appointment of a Royal Commission is the best method of dealing with the preparation of exhibits. At the same time, certain modifications might be made. Hitherto, there has been a tendency to appoint as Chief Commissioner a distinguished officer in the Royal Engineers. Such officers invariably perform with dignity and success the social and ornamental functions of the office that are so essential in maintaining British prestige. Better results in dealing with the exhibits and the exhibitors would, I think, be ensured, if the commissioner were in closer touch with manufacturing industries. In order to ensure continuity from Royal Commission to Royal Commission, it might be well for some Government department, for example, the Commercial Intelligence Department, to preserve the records of exhibitions, and be in a position to give information, with the aid of an advisory committee, to intending exhibitors in exhibitions that are not of sufficient importance to warrant the appointment of a Royal Commission. The staff dealing with such matters would then be available in the event of a Royal Commission being formed. As possible economies at future exhibitions, I would suggest that the preparation of a costly souvenir volume might be dispensed with, and that a grant towards the travelling expenses of jurors is probably unnecessary, as specialists, who are willing to give their time to the work, regard the expenses of travelling as a trifling matter.

1450. Would you dispense with the pavilion as well?—No, I do not think I should. In Paris, it is true, it did not compare favourably with the pavilions of other nations, though it was very costly.

1451. It was very costly, indeed, I think?—Yes, it was, but it was not impressive. The German one in the vicinity was somewhat theatrical in style, but it impressed the public.

1452. Do you think the pavilion in Paris was not only costly, but that it did not impart dignity to the English section?—I think it was too refined and delicate to appeal to the general public.

1453. (*Mr. Algernon Law.*) In regard to the Nuremberg Exhibition, were the sales which you say were effected there effected by the local firms which exhibited, or were they effected by foreign firms?—It was entirely a local exhibition. It was purely a Bavarian National Exhibition.

1454. So that it is hardly comparable with an international exhibition?—No. I gave that because it is the only case I have ever heard of where such figures were obtained.

1455. Again, at Kimberley, were the orders given there local orders?—The Kimberley Exhibition was an international exhibition. The orders were for the local mines. The mines in the Transvaal were then being opened up.

1456. But the orders were not given for Siberia or any other mining country?—No, they were purely for South Africa; but the orders were given to English firms, and not merely to Colonial firms.

1457. You have spoken of the educational value of exhibitions. I suppose their value is chiefly to the traders of the countries where the exhibitions are held, and not to the traders of other countries?—Our practice is rather to organise visits. For example, when I was a lecturer at the School of Mines, I remember taking my class over to the Paris Exhibition as a part of their course, and the Government then paid the expenses of the teachers in training who were among my students at that time.

Mr. B. H. Brough.

11 Jan. 1907.

1458. Should you consider it more important to send such visitors than to exhibit; in other words, that we have more to learn and less to lose by sending visitors than by sending exhibits which may be copied?—I think you can hardly expect to learn unless you are willing to teach as well. There has to be an interchange of advantages.

1459. An exhibition is free, and people can go in by paying; therefore, apparently, one might have all the advantages of taking part in an exhibition simply by sending people to the exhibition to learn?—In that way you would get all the educational advantages, except that you would not have the means of making a comparison. If Great Britain were omitted, it would be like studying the play of "Hamlet" with the Prince of Denmark left out of the cast.

1460. In the case of the exhibition of the English villa at Philadelphia, the advantage was really to the Americans who adopted our design of a villa, was that not so?—I do not think there was any advantage to the British architects in it. I have no information, but I should say probably not.

1461. You say that you think that the refusal of the British Government to participate in the exhibitions in the smaller countries might lead to a partial boycotting of British goods. Can you give any illustration of that? For instance, do you suppose that our refusal to take part in the Liège Exhibition led to any boycotting of British goods? Was there any ill-feeling there because the British Government did not participate?—I do not think there was.

1462. At any rate, it would be only a temporary feeling, I suppose?—I do not think it was serious there.

1463. It was hardly enough perhaps to weigh? If the British Government decided as a matter of policy never on any account to give grants for a British participation in a foreign exhibition, would there be any ill-feeling because we applied that policy in any particular instance?—I think there would have been a very great deal of ill-feeling if the British Government had not participated in the St. Louis Exhibition. That participation was very warmly appreciated by the Americans, and I think they would have conversely taken the opposite view if we had not participated.

1464. But if it were a matter of policy, would it not be like the question of Free Trade or Protection? Might you not, for instance, feel very bitterly that the Americans had a very high tariff, and might you not resent that?—Yes.

1465. I should think we should have more ground for resentment than they would have for our refusal to participate in an exhibition, particularly when the reason might be because, in consequence of the high tariff, there would be no gain to be got by participating?—Exactly.

1466. Can you account for the great reluctance of British manufacturers to exhibit, even when there is a Government grant? We find that letters are written to our manufacturers, and the Commissioners very often get no reply at all, and then they have to send round and try to beat up people to come in and exhibit?—I think that is largely because exhibitions have become so frequent. They are overdone. So the manufacturer is unable to discriminate between what is really a great international exhibition, and what is, say, an Earl's Court exhibition, which takes place annually.

1467. But if there is a Royal Commission upon it, they ought to be able to discriminate, ought they not?—They ought to be able to do so then, certainly.

1468. The Redditch people had a very good exhibit in Paris, but at St. Louis they refused to exhibit at all; do you think that was because their agents in the United States prevented them, our methods of trade being different from those of foreign countries, and we employing agents, who do not wish goods to be exhibited under the names of their manufacturers? Do you think that was the reason that operated at St. Louis?—I should think it was more a question of the market. In France there is a very great consumption

Mr. B. H. Brough.

11 Jan. 1907.

of British needles, and it would be desirable to be *en evidence* there. But in America they have their own needles filling the market.

1469. (*Mr. Wilson Fox.*) Following on what you told Mr. Law, would you say that if the British exhibits in future international exhibitions are to be in any way successful there would have to be a spontaneous desire, on behalf of British manufacturers, to show?—Yes, I should think so.

1470. I want to find out if I can how far there is any spontaneous desire on the part of the British manufacturer to show, or how far these exhibitions are promoted by people who think an international exhibition is more or less a good thing, but who are not traders or manufacturers themselves?—It is very difficult to say, because I think the question is complicated by the frequent recurrence of small exhibitions dealing with one special industry. Last year in London there was an engineering exhibition which was a success, all the space being taken up at once; but that was purely as a bazaar. The foreign exhibitors came forward to take space at once.

1471. I want to ascertain whether in these international exhibitions the people who are really at the back are the great trading communities; but you cannot say?—I could not say, except in the case of Belgium and Germany. The Liège Exhibition, for instance, was largely organised, and largely paid for, by Cockerill's, the biggest firm in the country.

1472. I will put it to you in another way. Supposing the British Government refused to take part in any particular international exhibition, do you think there would be any great outcry on behalf of the traders in this country?—Yes, I think there would.

1473. Do you think they would object?—I think an outcry would be organised.

1474. By the people who promoted the exhibition?—By the London Chamber of Commerce, and bodies of that kind.

1475. Do you think there would be a spontaneous outbreak of dissatisfaction on the part of manufacturers?—That was the case with the Brussels Exhibition, if you will remember, when Mr. Dredge, of "Engineering," was appointed to organise the British representation.

1476. You did not hear of any similar meeting in the great industrial districts in the north of England, did you?—No; but of course this is some years ago, and I had no connection with the Brussels Exhibition.

1477. You say you have formed the opinion that international exhibitions would have a beneficial effect on the manufacturing and export trades of this country; have you got any evidence to show that they have had a beneficial effect on the export trades?—I think my example of the best Yorkshire iron is a case in point. Of course I have not got any figures, but I consider that the fact of these Yorkshire firms going to the expense of sending all the way to St. Louis, after having previously exhibited at Chicago, indicates that they must have had some return.

1478. Is that not rather begging the question? They went to great expense, and if they did not get any return possibly they may not show again; but the fact that they sent does not prove that it paid them, does it?—That is true.

1479. I have heard of large firms who sent, and in consequence of their experience they will not send again; that might be the experience even of the firms you mention?—Certainly.

1480. You have not got any evidence that the export trades have benefited?—I have not got any evidence that would be worth anything.

1481. And you base your belief simply on the fact of their having sent?—Yes.

1482. Then you say that participation in international exhibitions is the only legitimate way in which a nation can advertise. I put this consideration to you, that there are other ways in which a Government could help trade if it is to spend money at all with that object. It might, for instance, help the commercial community by spending money on technical or commercial education, or by the dissemination of commercial intelligence, or it might help by spending money on consuls or commercial attachés. There are various ways in which the Government might apply their money with the view of helping British trade at home and abroad, and it is therefore an open question, is it not, whether the money would be best spent on such lines as I have indicated or in promoting exhibitions?—I think that is entirely a matter of personal opinion.

1483. Exactly; but I mean that there are other methods open to the Government besides exhibitions?—Yes. But it seems to me that in exhibitions you have got the advantage of full publicity and criticism; whereas if you take the case of a report by a commercial attaché, he may write a report on a subject connected with iron and steel, say, containing the most glaring errors that nobody ever calls attention to at all.

1484. Quite so, but then, on the other hand, there may be some very bad and unrepresentative exhibits at an exhibition, because we cannot get perfection, you know?—Yes, but everybody sees them and criticises them.

1485. I am merely indicating that there are other means, for instance, technical education or commercial education, besides participation in an international exhibition, by which the Government could help trade. You went on to say that non-participation in an exhibition would, in your opinion, be quickly followed by the most detrimental results. You would not suggest, would you, that England owes her commercial preeminence in any way to the fact of her having participated in a handful of international exhibitions since 1851?—I do think so.

1486. Do you?—I could go on multiplying examples. Take the 1851 exhibition; there James Young exhibited some oil shale for the first time. That was the starting-point of the oil shale industry of Scotland, and also of the great petroleum trade of the world.

1487. Do you think the petroleum trade of the world would not have existed if it had not been for that exhibition?—It would have come a few years later. To my mind exhibitions just serve to accelerate matters. At Stockholm, in 1897, Dr. De Laval showed a steam turbine for the first time. That started the manufacture of steam turbines. Of course, they would have come later, but the result of exhibiting that at Stockholm was that the South Kensington Museum immediately secured one, and it was put in the machinery collection there, so that everyone could see it, and the subject of steam turbines was brought home at once.

1488. What surprises me so is that one finds some people hold the idea that if we did not participate in international exhibitions disastrous effects would occur to British trade; while, on the other hand, we find that we have almost to go on our knees to get the people chiefly interested—namely, the British manufacturers—to participate. It seems such a curious state of affairs that the man whose greatest interest it is to exhibit has to be begged to do so?—Exhibiting means a lot of trouble and a lot of work.

1489. Still, looking at it from their point of view, if it meant business one would have thought they would be willing to undertake it?—They will do it if there is no trouble. Take the case of the exhibition in Glasgow, in 1901; there all the space was allotted at once, and the exhibition was a most brilliant financial success. There, of course, you had Scottish patriotism as a basis to work upon.

1490. But the Scotch are good business people, are they not, when there is money to be made?—That is what I thought; but still it was certainly a most charming and well organised exhibition.

1491. Is it really a case of trouble? If there was a considerable amount of money to be made by the manufacturer by sending goods to the Paris Exhibition, do you think that the question of trouble would enter into it? Do you not think that the question of business would enter into it, and that if it were going to be a business affair the manufacturer would take the trouble?—But it is all a speculation, and you are not sure that business will result.

1492. Is it always a speculation?—You might be ashamed of your product, and not anxious to show it side by side with somebody else's.

1493. Nobody who was ashamed of his product would ever expect to make any money out of it, would he?—I do not know.

1494. Take the case of advertisements in the papers

in England. There is very little trouble connected with advertising in the daily Press, and it is a question merely of finding the capital; but no manufacturer would advertise in the daily Press unless he was going to get some return, would he?—I think if you were to inquire of the technical papers which have most advertisements you would find that they have just as much difficulty in getting advertisements by their canvassers as exhibitions have in getting exhibits. You would find that the advertisement manager of a big technical paper is a man of remarkable talents and earning a large salary.

1495. Still, I go about the streets of London, and I do not think we are short of advertisements at the present time, so far as I can see. Seriously can you give me any reason why British manufacturers and traders are so reluctant to advertise their goods by showing at these large international exhibitions?—No. My only point is that I did not know they were so reluctant.

1496. And you do not think they are?—No; except the people you want. There is always a vast number of people who would be ready to exhibit, but they are not the exhibitors that would do credit to the national exhibit.

1497. Would it surprise you to hear that many of our best manufacturers decline to exhibit at the large international exhibitions?—Of course, one knows that you rarely see them. As to those that do, take the case of Nettlefolds. They sent to Paris a case of screws, and I remembered having seen that case at every exhibition I had been to.

1498. They have been persistent, at any rate?—Of course, but they did not spend much on their display.

1499. (*Mr. Harris.*) You suggest that one result of the Exhibition of 1851 was that British goods and manufactures were copied a good deal, but you have suggested also, in other replies, that we have learnt a good deal from participation in foreign exhibitions. Have you any opinion as to where the balance of advantage lies; do you think we have lost more than we have gained?—In the past I think we lost more, but I think now that we are gaining more.

1500. Do you think it can be put down pretty much as a fact that on the whole we now gain?—I think so. I am speaking from the point of view of mining and metallurgy, which are subjects with which I happen to be connected. I certainly think that we are learning more now.

1501. That is in regard to mining, metallurgy, and so forth?—Yes.

1502. You referred just now to the Glasgow Exhibition, but was that at all in point as an international exhibition?—It was called International, though possibly it was not so really.

1503. Was that not an exhibition which might very well suit the manufacturers immediately around? You cannot argue from that, I think, to an exhibition in Paris, for instance, as regards the trade, can you?—No, but you can compare that with an exhibition in Liège.

1504. Can you—from the amount of good done to British trade?—Taking the two cases, you can compare the amount of good done to the respective local trades in the west of Scotland and in the Liège coalfield. The Glasgow Exhibition, which was remarkable for the display of steel for shipbuilding, showed the world that in Britain ship plates could be rolled up to 100 feet in length and 150 feet in width.

1505. The exhibition at Glasgow may have been very useful to the local trade of Scotland, but the exhibition at Liège would be of no benefit whatever to that same local trade or to the local trade of any part of the United Kingdom, would it?—No, it would not, I think.

1506. At any rate, I put it to you that it might not be?—That would be so.

1507. You referred in one part of your evidence to an exhibit at an international exhibition not being organised on money-making lines; what lines do you lay down as those which should rule in an exhibition?—I do not wish to lay down any rule. I merely wished to state the view that in the Hungarian Exhibition of 1885, at Budapest, the whole exhibition was the outcome of intense patriotism, or else intense anti-Germanism, in order to show what Hungary could do. In the same way at Düsseldorf, all the iron works and collieries of the Rhine and Westphalia exhibited in a way that they have never done at any other exhibition, just because they were in their own home.

1508. Do you think that an exhibition has any necessary connection with the trade relations between countries?—I would not go so far as to say that it has none at all.

1509. I said "any necessary connection"?—Yes, I understand.

1510. (*Mr. Malcolm Ramsay.*) Following up a point raised by Mr. Harris, do I understand your opinion to be that the benefit derived from exhibitions accrues mostly to the country in which the exhibition is held?—Yes, I think that is so.

1511. Take, for instance, the Paris Exhibition; that would benefit the French exhibitors much more than it would the German and British exhibitors, would it not?—Yes.

1512. You advocate the participation in foreign exhibitions as being favourable to trade in this country generally?—Yes.

1513. Have you formed any opinion as to whether British exhibitors derive more benefit from exhibiting in a foreign exhibition, when there is a Government grant given for their representation, than they do from exhibiting in a foreign exhibition when there is no Government grant given?—No. I have not had any opportunity of seeing any figures that could guide me at all in answering that question.

1514. I would put it thus: There is, first, the question of the benefit of exhibitions generally; next we have to consider how far the State is justified in giving grants for the support of its own manufacturers at foreign exhibitions. Have you differentiated between these two questions?—No, I have not. I am afraid I have not the requisite knowledge.

1515. Do you hold that it would be possible to give adequate official encouragement to British exhibitors in foreign exhibitions, without necessarily giving a large Government grant? Would it be possible for the Government to supply the organisation, the committee, and so forth, with facilities for the traders generally, but to let the traders bear the main expenses themselves?—That was the arrangement at Milan, I think, if I understand you correctly.

1516. Do you think it possible to secure adequate advantages to British traders under such a system as that?—I think that roughly the advantages would be the same under either system as long as you exhibit. But from the point of view of international relations and international prestige I think having a Chief Commissioner and having the machinery of a Royal Commission is a distinct advantage.

1517. Do you think we need go further than that? Need we put our hands in our pockets and spend perhaps £100,000, in addition to appointing a Royal Commission?—Personally I do not think you need.

1518. I can quite understand that British traders may get better sites and so forth at an exhibition if there is an official organisation to help them as against the trader from other countries, but we are told by other witnesses that there is a great reluctance on the part of British traders to volunteer to exhibit, and it seems, therefore, to be very doubtful whether the State is justified in going further than providing the machinery and in spending a large sum of money for the benefit of people who are most unwilling to go to the place at all. Have you considered the subject from that point of view?—No.

1519. Does your experience show that some trades are more likely to benefit by exhibitions than others?—My idea is that the smaller metal trades benefit most. That was the opinion I derived from serving on the jury in Paris. I was certainly very much struck with the information given by some of the French exhibitors; they seemed to be doing a good deal of business out of the exhibition.

1520. And you thought the manufacturers of the smaller articles were benefiting?—I was not on the jury for the large metallurgy, but Sir William Roberts-Austen, who was the British juror for those exhibits, was staying at the same hotel as I was, and he seemed to be quite surprised to hear how well the hardware people were doing.

1521. May I put it to you that some trades are likely to get much more advantage out of showing at an exhibition than others?—Yes, that is so.

Mr. B. H. Brough.

11 Jan. 1907.

1522. Therefore if you spend public money largely on British representation, the main benefit goes to one class of trader, to the exclusion, perhaps, of others?—But I think there is a factor that you are not taking into account in your point—that is, that probably in all future exhibitions the field will be limited. At Milan last year the field was not nearly so large as it was in Paris. All the Paris exhibitions have tended to show that an international exhibition covering every field of industry is too cumbersome; and you find nowadays that you have an Inventions Exhibition, or a Health Exhibition, or a Fisheries Exhibition, or, as at Milan, an exhibition in which transport is the principal *raison d'être*.

1523. Then if exhibitions are getting specialised, do you think it would be possible to deal them out all round the various trades of this country so that every trade had an exhibition, and so a fair share of the Government support? It seems to me that the heavy steel trade—the manufacturers of locomotives and so forth, are handicapped at exhibitions because the expenses are so large and orders may not result to them in the same way as in the case of exhibitors of pottery, which is a nice convenient article for the manufacturer to take over?—That would be so.

1524. Therefore there is some danger of our unduly favouring the manufacturer of smaller and portable articles when we subsidise exhibitions?—But in the case of the locomotives every technical paper in the world praised the British locomotives at Paris, and the praise was forthcoming because the British locomotives were put side by side with complicated Hungarian, Austrian, and Italian productions. That made the British locomotives look so exceedingly attractive.

1525. Do you agree that on the whole the benefit particular trades get out of an exhibition varies very much?—Yes, undoubtedly.

1526. (*Sir Isidore Spielmann.*) Returning to your statement that non-participation would, in your opinion, be followed by detrimental results, I suppose you would agree that it would be better not to participate at all in exhibitions than do so badly?—Yes, I think so. That was my impression in Barcelona; I felt ashamed when I saw the British exhibit there.

1527. How do you reconcile that reply with your references to the Brussels Exhibition of 1897 and to the exhibitions at Liège and Milan? Do you refer to those as successes?—Brussels and Milan I would distinctly regard as successes.

1528. Setting aside the important art section and the collection of ship models, what success can you point to in the British section at Brussels? What one exhibit was there which was creditable to this country?—I visited that exhibition merely as an ordinary tourist, and am afraid I cannot remember them well enough. But I misunderstood your question; it was a financial success at Brussels.

1529. You said in reply to another question that "the results obtained at some exhibitions by private enterprise have been eminently successful, notably at Brussels." It is a notable fact that the Art section saved the credit of this country at the Brussels Exhibition, and that, apart from the ship models, there was absolutely nothing there which could be called a success. Why do you call it eminently successful?—Because they refunded almost all the money that was subscribed for floor-space, and I remember the flourish of trumpets at the time.

1530. Then the refunding of the money was the success?—That was an indication of success.

1531. Later on you said that at the Milan Exhibition the British exhibits were a success, "owing to the very complete, representative and well-arranged collection of ship models"; apart from the ship models what other success can be claimed for this country at Milan?—There was really nothing very striking, apart from the exhibits of British firms with branch establishments in Italy.

1532. At Liège they had not even a collection of ship models, I think?—No.

1533. What success was there at Liège?—There was practically no participation at Liège. The British section was quite insignificant.

1534. Then you have referred to approaching exhibitors by circular-letters; have you ever had any experience of trying to secure exhibitors by circular letters?—I was on the Mining Committee of the Royal Commission for St. Louis.

1535. Did you do any good by circular-letters?—I do not think so, but then they were followed up by private letters.

1536. With reference to Royal Commissions, you say that certain modifications might be made in them; what modifications would you suggest?—There is the point which I ventured to note with regard to the appointment of Chief Commissioner.

1537. Then you say that it is unnecessary to give jurors their travelling and other expenses incurred. Do you think that this country would get jurors to go to, say, St. Louis, on their own account and at their own expense?—Yes, I think so. The Metallurgical Jury got Professor Bauerman as juror. He was also attending the meetings of the Iron and Steel Institute in America at the time, and he would probably have gone in either case—whether his expenses were paid or not.

1538. But if he had not gone there on behalf of the Iron and Steel Institute——?—He was there just as a member of the Iron and Steel Institute.

1539. But if it had not been for that accident, is he, a professor, a man who can be expected to go over, at his own expense, as British jurors?—St. Louis is a far cry.

1540. Then your statement would not apply to exhibitions at great distances from this country?—In Japan, for instance, I suppose not. It is only an idea that occurred to me, but I really do think you could probably get jurors to go any distance.

1541. (*Chairman.*) Do you not think that you would often lose the services of good men as jurors if you did not pay them their bare expenses for going?—You do not, as a rule, pay them their bare expenses; you just pay them their railway fare. It seems to me that the position of a juror might possibly be better without that.

1542. Do you think it would attract a better class if you never paid anything unless you paid them well?—Unless you pay them well it is better to let the public know that the jurors are working freely in their service.

SIXTH DAY.

Friday, 25th January 1907.

PRESENT:

Sir Alfred E. Bateman, K.C.M.G. (*Chairman*).
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G.
Mr. Algernon Law.
Mr. Malcolm Ramsay, C.B.
Sir Swire Smith.
Sir Isidore Spielmann.
Mr. S. J. Waring.

Mr. U. F. Wintour (*Secretary*).

Mr. Thomas Cope, called and examined.

Mr. T. Cope 25 Jan. 1907

1543. (*Chairman.*) What is exactly the name of the firm that you are connected with?—I am a member of the firm of Henry Johnson and Sons.

1544. What would you describe them as?—Continental carriers, general transport agents, and also exhibitors' agents from time to time.

1545. I believe you have had a great deal of experience in exhibitions?—Yes, I think I may say I have had a good deal of experience.

1546. You had experience in Brussels in 1897?—Yes, that was one of my greatest experiences.

1547. Then you were at Liège in 1905?—Up to a certain period; that is, up to the time that the exhibitors were mostly got together, and then I resigned.

1548. Was that because there was no British grant?—There was no British grant, and the committee I was working with were not willing to go on with the work. The Belgian Consul in London, who was a member of the committee, and who took a prominent part in the Brussels Exhibition, was very anxious to go on with it, and he had personally guaranteed the committee against loss, but he died in January, 1905. I myself retired for various reasons. The Belgian authorities were not keeping faith with us, and it was impossible to go on with it upon what I considered proper lines; in fact, it was owing to the impossibility of carrying on the work of the section otherwise than as a commercial speculation that I resigned.

1549. I think we need not go into the reasons, but you had experience there?—Yes.

1550. Then you had experience in the very important exhibitions held in Paris in 1889 and 1900?—Yes. I was resident there throughout the whole of those two exhibitions, acting as transport agent and as exhibitors' agent.

1551. Then you have had to do with other exhibitions, such as the Health Exhibition of 1884?—Yes. I did a little for the Paris Exhibition of 1878, but I was not resident in Paris at that time, and I only worked at it from this side. My real experience dates from the Health Exhibition.

1552. Then I think you were connected with the St. Louis Exhibition of 1904?—Yes; but on that I was only engaged here in connection with the transport of the British exhibits.

1553. Then I think you were a member of the British Commission for the Milan Exhibition?—Yes. I am also a member of the permanent Exhibitions Committee of the London Chamber of Commerce.

1554. I understand you are going to give us your experience about these exhibitions?—I should be happy to give you any information in my power.

1555. You think that international exhibitions have had a beneficial effect on the manufacturing and export trades of this country, I believe?—Yes, I do undoubtedly.

1556. But with regard to the Arts section, you do not offer any opinion?—No.

1557. What do you say as regards the commercial relations between the countries concerned?—That I consider, if I may say so, to be rather a vague question; but in regard to the commercial relations between the countries in the sense of developing trade, I consider that exhibitions have certainly had a beneficial effect. I know from experience that after an exhibition, generally, trade is opened up, because we have continued to act as transport agents or shipping agents for the various firms which have exhibited.

1558. Is it your experience that trade has been increased by these exhibitions?—Trade has been increased. I have often found that people have gone to an exhibition either with the distinct object of advertising something unknown in the country in which the exhibition was held, or they have been wavering in their intention to open a depôt or agency there, and they have taken the opportunity afforded by the exhibition of doing so; and they have continued business ever since.

1559. What are the particular industries which you think have chiefly benefited by exhibitions?—The machinery trades, I think, may be cited as the principal ones. Machine tool-makers are always ready to participate in an exhibition, and they invariably book numerous orders. It is rare that any quantity of machinery comes back to this country. I may mention the Paris Exhibition of 1900 in particular—and it was the same with the exhibition of 1889; practically all the machine tools and much of the machinery were sold for delivery all over the Continent—some of it went as far away as Persia, I remember.

1560. I think you are of opinion that manufacturers of gas engines, spinning, and wood-working machinery, have largely benefited?—Yes, especially the manufacturers of gas engines. Certain well-known firms, such as the National Gas Engine Company and the Campbell Gas Engine Company, are doing now an enormous trade, and, I am told, cannot manufacture rapidly enough for France at the present moment. Their trade, I think, dates chiefly from 1900. They made extensive exhibits then, and their trade has gone up by leaps and bounds ever since.

1561. Is that in consequence of showing their goods at the exhibition?—It has been done by showing their goods and seizing the opportunity to secure a good agent or establishing their own representative in the country. One of the best-known machine tool makers was just establishing a branch with an agent in Paris for France and Belgium; that man is now booking more orders than his firm can keep pace with.

1562. That is because they made use of the exhibition as a showroom?—Yes. There are many trades that use an exhibition as a local showroom. In 1897, at Brussels, all the sanitary earthenware makers, especially from the Potteries district, practically, in a manner of speaking, transferred their showrooms from the city to the Brussels Exhibition, and, I think I may say, developed their trade. That is very often the experience. A certain firm of furniture manufacturers were wavering at that time whether they would open in Brussels or not, and they seized the opportunity of making a display in the exhibition, and of opening at

Mr T. Cope. 25 Jan. 1907.

the same time. Their shop there is still running in a prominent part of Brussels, and apparently doing good trade. So with the furniture trade in Paris in 1900; some of them did the same thing. The proof of this is shown by the fact that the depots still exist.

1563. What do you say about awards at exhibitions; do you attach importance to them?—I attach great importance to them. I think that is a point which has been very much lost sight of in many exhibitions, notably perhaps in the Paris Exhibition of 1900. Some managers or members of the committees for the exhibitions attach no importance to them; but from my own experience I can say that many people go to an exhibition with the express object of securing an award. They want it perhaps for the advertisement which is given to certain inventions of some little-known manufacturer; or if they have been at the top of the list for a certain time they want to add one more grand prix or gold medal to their advertisements; so that they attach the greatest importance to these awards. The question is very often asked: "If I go, do you think there is any chance of getting an award, or getting a good award?" That has to be taken very seriously into consideration. When we are present as exhibitors' agents, we have to strive and strive as far as possible to get the best obtainable award.

1564. That is, to secure gold medals, diplomas, and so forth?—Yes. Of course, nowadays everybody wants a grand prix, which is the highest, or a diplome d'honneur, a gold medal, or a silver medal.

1565. Then we come to the *per contra* side of the question. Do you think that the interests of any industry are adversely affected by exhibitions?—That is a question I should have a great diffidence in answering. I cannot at the present moment think of any trade that has been prejudiced by them. Of course, manufacturers who feel that their trade is going to be prejudiced will not go to them. Exhibitors do not come in at all easily, and anyone who has any experience knows that. They weigh up very closely for themselves the question whether they are going to benefit, and if they know that the tariffs of the country in which the exhibition is being held are against them, they will not go to that exhibition.

1566. I gather then that you think people will take care of themselves in that respect?—Yes; and I think one may say they are fully able to do so.

1567. Do you think that the direct commercial results obtained are such as to warrant the Government of this country in giving grants to organise exhibitions?—Yes, emphatically; only there should be some better machinery for getting these grants and getting them earlier.

1568. Could not all this be as well done in the future by private enterprise?—No. I am strongly opposed to private enterprise in these matters.

1569. Why?—Because directly it is thought that anyone promoting an exhibition is, as the popular phrase goes, "on the make"—that is, if the person promoting it has some pecuniary benefit to derive from it, manufacturers fight shy of it.

1570. There might be a combination, I suppose?—Where I have seen that tried, I think the result has been a failure—I might almost say a fiasco. I have two or three instances in my mind at the present time where it has been left to private enterprise; but the people have gone in small numbers, the show made has been discreditable to the country, and it would have been far better from every point of view if it had been left alone.

1571. Supposing we take your view that public money should be granted for these exhibitions, what special conditions do you think should be asked for?—From those to whom the spending of it is entrusted, do you mean?

1572. Yes; are there any special conditions or restrictions that you would suggest?—My view is that the money so granted should be carefully disbursed in the best interests of the exhibitors. Of course, to be useful the grant should be given earlier than it generally is. Now, very often the matter comes before our committee of the London Chamber of Commerce; its decision is that it is desirable that there should be a British participation, and then comes the question, Will the Government give any money? It is always feared and rather assumed that they will not. Then the committee goes on between hope and fear for a considerable time. Other countries are getting to work and are engaging space, very often getting the choice of space, and then very much of the ground is lost before we can set to work. It is very late when Great Britain gets to work.

1573. Would you give a grant before you know that there are any exhibitors coming forward?—There must be some machinery in my view for knowing about that before exhibitors will come forward. If some permanent committee could be formed, some organisation which need not be gone into for the moment, as is the case in France, that would probably meet the difficulty. I am perhaps anticipating slightly the order of your questions, but I may say that in France the two things work together. Some such organisation as I suggest would place before the Government, I take it, the necessity for a grant. There would be a certain number of exhibitors practically guaranteeing the success, and then that grant being obtained, the money should not be spent lavishly according to some person's whim; neither should it be hoarded in a miserly fashion, as one has seen, with a view of returning as much as possible at the close of the exhibition. That money should be laid out in various ways. For instance, the space in an exhibition has always to be paid for to the foreign authorities. The question of how much space can be let out to exhibitors and how much must be, so to speak, wasted in passages and in making a proper display, must be taken into consideration; and a portion of the grant should, I think, be given to equalising matters, so that the cost of space should not exceed a certain usual figure. Then there is the question of receiving exhibits at the door, the gateway, or wherever it may be in the exhibition, or in the railway trucks, the unloading of them, and the placing of them before the allotted spaces. That, I think should be included in the price of the space. Very often an exhibitor takes space and calculates his expenses, and then finds that his goods have to be unloaded in some impossible corner, or that they have to be got, as was the case in Paris, right across the Champs de Mars, where the vans went every time up to their axle-boxes in mud—sometimes I have even had to lay down iron boiler-plates in order to make a passage or to make a kind of bridge. All that expense at present falls on the pocket of the exhibitor.

1574. And you do not want the exhibitor to pay anything at all for these?—I say the exhibitor should pay for his space, but the question of dealing with the exhibits, taking them into the exhibition, and putting them where they have to go, that is to say, putting them in front of the spaces—should be covered, I think, by the grant. In the same way there should be a proper guardianship. In some exhibitions we find competent guardians, in others the British exhibits are left at the mercy of foreign guardianship, and there is frequently theft, which might easily be avoided.

1575. There are the ordinary watchmen, I suppose, usually for the whole exhibition, are there not?—But they are foreigners and local watchmen. If you were on the spot you would know the class from which they are drawn. They are out-of-works, and many of them, I think one might say without any want of charity, take the position for its possible advantages.

1576. We are getting rather into details now, are we not?—I have got rather into details in trying to answer your question, what restrictions should be laid down? I think that if the Treasury gave a grant of, say, £5,000, that £5,000 should be spent for the benefit of the British section, and there should be no question of seeing whether it could not be done for £2,000 or £3,000, so that some individual might endeavour to gain kudos by saying that he has managed somehow or other very economically, and he is returning a certain proportion of the grant. In a word, the grant should be used for the greatest benefit of the British section.

1577. What is your experience of the methods which have been adopted up to now? They have been very varied, have they not?—I should call the methods a collection of samples—some good, and some as bad as could be.

1578. You are in favour, are you not, of a permanent management of the exhibitions?—Yes.

1579. And your criticism would rather be that in the past you have had practically amateurs, new to their work each time?—They are generally amateurs. That has been the case in the whole of my experience; and most of those amateurs have only gained a fair knowledge of their business, if I may use that term, by the close of the exhibition.

1580. I gather that you do not think that our methods compare favourably with those adopted by other countries?—By no means.

1581. Which would you put first among the countries? Which would you prefer for their methods of dealing with the exhibits?—I prefer the French. I think I should put them in this order: French, Belgians, and Germans. Those three come very closely together. The French method I think is the better.

1582. You know the French system, I suppose?—I know it pretty well.

1583. Do you like that sort of double system of having a society and then Government superintendence?—Yes, because by means of the society they readily get at the wishes and inclinations of the exhibitors, and, after all, you cannot get a representative section of any kind—and we are speaking and thinking now of the British section—without the co-operation of the exhibitors. Of course, the section may be padded up, and you can get so many lines in your catalogue by getting a number of so-called official exhibits which have done duty over and over again; but, with all deference to the departments and the societies which send them, they do not represent Great Britain properly.

1584. You want trade to be represented more?—The object of the British section, I take it, is the development of trade. One sees curious things sometimes in a foreign country. I was between two and three months in residence in Milan during last year's exhibition, and there one saw a collection of books exhibited by Government Departments printed in English, and I do not think I shall be exaggerating when I say that they never came out of the glass cases that contained them. I do not think that could be claimed as being an exhibit worth much consideration. There are many such things.

1585. Do you think that the causes you have mentioned account for the success or failure of British exhibits in times past?—I do think so. May I refer to one or two exhibitions in particular? Would it interest the Committee if I were to do so?

1586. Yes, shortly, please?—Take the Antwerp Exhibition of 1894. That was under the superintendence of a gentleman, estimable in his way, Her Majesty's Consul-General for Belgium. From a very early stage that gentleman was going about the Exhibition publicly lamenting with everybody he met upon the folly which led him to risk his money in running a British Section. He had been talked into doing it, as he put it, for some reason or other. The British Government made a small allowance of some £400 to assist him in the charges. He had associated with him the then acting Greek Consul as his assistant commissioner—a gentleman of whom it could not be claimed that he had any real interest in the development of British trade. There was no money for a proper organisation, and from the beginning to the end exhibitors were left to struggle on as best they could. Just at the critical moment when the juries were making their visits, the Commissioner fell ill, the assistant commissioner did not feel equal to the task, and disappeared. Then Sir Charles Kennedy came over. He was an old personal friend of Mr. De Courcy Perry.

1587. Most of us round the table, I think, know him?—Sir Charles Kennedy came over to see what he could do. He was entirely strange to the section naturally, and I had the honour of helping him to a considerable extent at his request; but there was no organisation whatever to protect the interests of exhibitors or to help them in any way. I will not say that Mr. De Courcy Perry embarked in it with any view of making money by it.

1588. No, and no one will say that?—But it was absolutely a private undertaking in the broad sense of the word.

1589. I suppose it was rather forced on him?—Exactly; it was rather forced upon him, I believe, by local influence.

1590. You give that as an instance of comparative failure, do you?—Yes. Then take the Amsterdam Exhibition of the next year. That was promoted by Reuter's Agency, who placed a representative over there. A certain number of exhibitors were got together. An agent—a manufacturer's agent—a shopkeeper there, working on Universal Provider lines, made a very large collective display; but the British participation was extremely bad.

1591. These two were rather small exhibitions, were they not?—They were advertised as international exhibitions, and they were patronised by various countries. The Antwerp Exhibition could not by any means be placed in the same category as the Amsterdam Exhibition, which was undoubtedly a small one. The Antwerp Exhibition was an exhibition of a certain importance. The display made generally was good, and I consider it was an exhibition which merited either a proper participation by this country or to be left severely alone. *Mr. T. Cope.* 25 Jan. 1907.

1592. What is your opinion about our participating in this sort of moderate international exhibitions?—From one point of view I think they are better left alone. Take Milan. In my opinion, for what it is worth, Milan is not a city which should have had an international universal exhibition; but the moment that it was known that France and Germany and Austria-Hungary were going to take part in it to the extent they did—Belgium again had an excellent display—then I think it was certainly necessary that this country should take part; and I think it should have taken part to a much fuller extent than it did.

1593. You have given us three instances of rather minor exhibitions where we have not had Royal Commissions. What do you say about the appointment of a Royal Commission as a satisfactory method of dealing with the organisation of an exhibition?—Take the Paris Exhibition of 1900. The Royal Commission organisation there was too clumsy, and did not get down to the level of the exhibitors.

1594. Do you mean that it was too large?—No. I find fault with the organisation and the attitude adopted by the Royal Commission. If I may diverge a moment, it is not often, I think, taken into consideration how exhibitors have to be got into line to exhibit. Exhibitors do not flock to an exhibition just because it is advertised, or because they have received a circular. As I once told a gentleman who was afterwards Commissioner-General for a Royal Commission, who came when I was on duty in Brussels to see me with an introduction, and asked me at the time how exhibitors are got together, the first question is, How much? That is undoubtedly at the root of the whole thing.

1595. Do you mean how much has the exhibitor got to pay?—How much it is going to cost him, and how much he is going to get out of it. That is a point which has to be taken into consideration from the very first. A manufacturer will not undertake to exhibit unless he knows what he is going to get for his money—that is to say, what the building is going to look like, what is the particular hall into which he is going, and what that is going to be like, and what sort of space he is going to get.

1596. Does he attach much importance to a great pavilion for the British section?—No; but he wants to know whether he is going to be in a hall with certain characteristics, or whether he is going to be in a gallery or under a gallery, or an avenue, or in a corner against a dead wall. I found personally in 1900 that it was impossible to get any of that information. I went myself on behalf of one of our principal exhibitors, the late Baron de Bush, of W. J. Bush and Sons, a name I believe very well known. His firm had made a very good display at Brussels, and I acted for them as a kind of technical adviser in various matters in connection with exhibitions. He was prepared to make a very extensive exhibit showing the crude products and the process down to the finished articles in perfumery, the essential oils, and various other goods manufactured by them. He proposed to make a show of four cases with a central cupola. I went to see whether I could negotiate the necessary space, but the idea of discussing it was scouted. I was told it was quite impossible to discuss any such conditions as that—"Let him send in his application, and if space can be allotted by the Committee it will be allotted."

1597. How long before the exhibition was that?—Speaking entirely from memory, that was in the early stages of the work.

1598. Was it a year before?—It was in the latter part of the year before. I approached the Commission in respect to several other proposed exhibitors, but always with the same result. It was only when time wore on, and they found that exhibitors did not flock in, that the methods were somewhat altered; and I think I am correct when I say that certain firms had to be called upon. I was told that it was quite unnecessary and that it was quite undignified even to canvass to see whether exhibitors could be got together;

Mr. T. Cope. 5 Jan. 1907.

but that I know is a necessary step. Exhibitors want to know what they are going to get for their money before they will give in their adhesion.

1599. So that there must be a sort of scheme for the spacing-out in the minds of the authority whoever it is?—It is impossible, of course, to make a definite plan, but it is not impossible to work upon a plan from the very beginning. I endeavoured to get a representative British section together at Liège. There was a very satisfactory number obtained; some of those did ultimately take part in it and some withdrew, but those who did ultimately take part comprised a number of high-class exhibitors. There was one firm in particular, Burroughes Wellcome and Co., I believe a name very well known, who made no fewer than three distinct exhibits, but they would not engage a single foot of space without knowing where they were going to be placed. Although it is not possible to make a definite plan, I say that it is possible to work upon something in the way of a rough and ready plan from the very beginning. Take Chubb and Sons again. Chubb and Sons will not go to an exhibition unless they know what space they are going to have. I think that principle should be established from the initial stage.

1600. Does all this which you have told us, which is very interesting, lead to the moral that we ought to have a permanent staff? Do you think it has been done hitherto in an amateur way?—I do think so. There are gentlemen who have been connected with Royal Commissions, gentlemen of very high intelligence and great knowledge in exhibition matters; at the end of an exhibition those gentlemen absolutely join the ranks of the unemployed, as one finds after the close of an exhibition. I have received myself not once, but I may say half a dozen times, letters from gentlemen I have been dealing with and members of the staff to know whether it is possible to find them any employment.

1601. But you would not keep on the whole of the large staff of a Commission, would you?—Certainly not; but if there was some organisation such as the Exhibitors' Association which is being talked about very much at the present time, there might be an arrangement I think by which a certain number of the leading members of the staff might be provided for.

1602. Have you any ideas about the qualifications that you want in the Commissioner and the chief members of the staff?—For the Commissioner I say decidedly that you should have a commercial man, because a member of one of the Services, however estimable, does not get in sympathy early enough, if he ever does, with the manufacturers. A commercial man has a better knowledge of what exhibitors require.

1603. Would you easily get a good commercial man? Is he not fully occupied in his own business?—We have had them. I look upon my late esteemed friend, Mr. James Dredge, as an ideal Commissioner. He was a commercial man, and he knew the requirements. He had had, of course, a ripe experience of various exhibitions as a member of Commissions. From the beginning of his work he kept the requirements of the exhibitors steadily before him, without in any degree toadying to them or giving them any more than they were justly entitled to.

1604. I think he was an engineer and a Press man?—He was an engineer and one of the proprietors of a well-known journal. He was interested also in printing establishments, and so on. He was a commercial man.

1605. Do you attach importance to their knowing the language of the country in which the exhibition is being held, or French, anyhow?—They should know French anyhow, because naturally French is the universal language. When the Commissioners met in Brussels—we had at certain times weekly dinners and meetings—the Commissioners of whatever nationality always spoke French. Then French is generally the language for all exchange of documents; it has been so at this last exhibition at Milan. One always found people speaking French, and in any letters that were sent in the French language was used.

1606. (*Mr. Harris.*) Did I rightly gather from what you said that the British trader looks upon an exhibition as a means of establishing an agency in a foreign country?—Very often.

1607. But not invariably?—No, not invariably. Some have no intention of doing so. But I could name a certain considerable number who have taken that view. Then there are various other considerations. There is a firm that has flashed into my mind at this moment, the first manufacturers of fishing tackle in this country at Redditch; they have to my knowledge in three instances gone to an exhibition with a view to help their local agent, having already an agency there; and in one instance they took certain space and exhibited solely at the request of their local representative. Or it may be that they have no intention of establishing their own branch or depôt, but they have travellers in the country; and then they notify everybody in their trade that they have a showroom, so to speak, at the exhibition, and it is thus made the medium of developing trade by means of canvassers and travellers.

1608. In the country of the exhibition, that is?—Yes.

1609. Supposing for a moment that that is a prevalent idea, do you think that that justifies the grant of public money to aid the trader?—Yes; if it is the object of Government to develop export trade, certainly.

1610. So that you suggest as the primary justification of an exhibition that it shall aid in the development of the export trade?—Yes.

1611. Do you say that that has been the general result of exhibitions within your knowledge?—Certainly.

1612. I understand that at Liège, at a certain point you threw up your connection with it?—Yes.

1613. Would you mind telling us why you did that?—My connection, so far as I have been officially connected with exhibitions, has been in an honorary capacity. I consented to carry on the work up to a certain point, although it was almost a forlorn hope. The London Chamber of Commerce Committee was desirous of going on. We were assisted very loyally by the Anglo-Belgian Chamber of Commerce in London and by the Associated Chambers of Commerce. But the Liège authorities did not keep faith with us. We agreed to take a certain amount of space, 3,000 metres, and we made all our calculations upon the probable receipts from the sale of that space. The working expenses being reduced to the very lowest figures, the manipulation of 3,000 metres would have enabled us to cover expenses. The Liège authorities without any warning reduced that 3,000 to 1,900, cutting us down particularly in the machinery gallery where my demands for space were the heaviest. We carried on *pourparlers* for some two months, but without obtaining more space. At a certain moment I went to Liège with two of my colleagues, and it was agreed that for a slightly higher payment per metre they would build an additional hall for us. I telegrahed to a canvasser that I had at work in the Manchester district amongst the machinery firms, that he could go ahead with his canvassing because I had secured so much more space. Subsequently, some ten days after, I had a notification that they could not carry out their undertaking because this new hall was to be parallel with the German hall, and they found that the Germans had decided to make a monumental entrance just at that spot, and so they could not carry out their undertaking. Then they sought to restrict the space still more.

1614. Are we to gather from your statement that the reason really was friction with the authorities?—I do not like to use the word "friction." It was simply that they did not keep their word. They would not give us enough space to make the section pay for itself. Then I could not carry it on except as a commercial speculation, and I would not take it on on those grounds. The Belgian authorities offered to find the funds if I would act as their representative, and they subsequently found someone to work upon those lines.

1615. What I wanted to bring out was whether you thought the British traders were going to suffer because you could not get the right space?—I put it rather this way, that I say it was not possible to have what I considered a creditable British section, and I would not be connected with one that was not creditable.

1616. As a matter of fact, after you gave it up, did you form an opinion as to how it worked out?—Yes.

1617. I mean from the traders' point of view. I do not ask whether it was a creditable exhibition or not, but did the trader get any advantage out of it?—I think the results were very negative. The few people who had spaces in the machinery section did, I believe, very well. I know one of them in particular did.

1618. Generally speaking, from such an exhibition who gets the benefit?—The local authorities.

1619. (*Mr. Malcolm Ramsay.*) Continuing for one moment about Liège, did you find you were handicapped by not having the Government authority at your back?—Most decidedly. Because one of the first questions asked is, Is this under Government patronage? We tried very hard indeed to induce the Government to give us the £800 which had been returned from Brussels. That would have carried, of course, a certain Government recognition with it, and that would have been quite sufficient in itself to have turned it into a success.

1620. Then do you say that if you had had a recognised official status that would have been of much more importance to you than a grant of public money?—It would have required a small grant.

1621. But not a very substantial grant?—A grant of £1,000 would have made a good section, which would have been well filled, and even the £800 surplus we asked for would have been sufficient.

1622. Do you attach more importance to the Government giving official countenance than to the actual size of the Government grant?—I combine the two. I say the two are required—a grant which carries with it of course the recognition in some form.

1623. But the first and the most important element is Government recognition?—Yes; but that in itself is not sufficient without some grant.

1624. You want Government to pay the working expenses of official organisation, but it does not follow that Government need pay, for instance, for the space occupied by exhibitors?—No.

1625. Or necessarily for their transport?—You should have your working expenses and also the guardianship covered. You will always find some gentleman who will take up the position of Commissioner naturally in an honorary capacity.

1626. You were speaking of manufacturers booking orders through exhibitions. Is it your experience that our traders get more orders by going to exhibitions than they would by employing their own travellers?—Yes, because the people go to the exhibitions. I know that in many instances in Paris in 1900 some of our largest manufacturers of machine tools booked orders from the French railway companies and from the Belgian State Railway; and I think I may safely say that a traveller in the ordinary way would not get into those administrations—certainly he could not carry the machines with him and show them. He would not have booked those orders from a price list in the same way as they booked them from the working machinery at the exhibition.

1627. Then for some trades an exhibition is the best kind of advertisement?—Yes.

1628. If so, ought not the traders to bear the expense of advertising?—They do. There is none of them can go without spending a large amount of money. But I say that they should be assisted, that the space money should not be too high, that their interests should be safeguarded, and that all they have gone to the exhibition to obtain they should get with as much facility as possible.

1629. Did I rightly understand you to say that the greatest advantage had not been got out of the Government grants in the past?—In some instances. I am a member of the British Commission for the Milan Exhibition. I say I do not feel that we have got the best results from it. There has been rigid economy, and it is public knowledge, because it is everywhere in the Press, that it is hoped to return something like £4,000 to the Treasury. From my personal observation I say that some of that money should have been spent in Milan.

1630. Take, for instance, the cases of Paris and St. Louis, where the Government grants ran into six figures?—Of course, St. Louis was done upon totally figures?—Of course, St. Louis was done upon totally

1631. Would you say that at St. Louis the money might have been spent to much greater advantage?—No. I have nothing whatever to say in respect of St. Louis, because that is entirely out of any possible discussion. If you have Committees with large amounts at their disposal, and they are able to select the exhibitors that they desire to see in the section, and to pay all their expenses, of course there is no better way of getting the very cream of the country.

1632. Do you think that with better organisation the St. Louis money could have gone further?—No. I leave St. Louis entirely out of my own observation.

1633. Then you would not put the Paris Exhibition in the same category?—No, by no means.

1634. I understand you to think that, besides organisation on the part of the Government, combination among manufacturers is necessary?—Yes.

1635. Is there a field for it now? There is no combination particularly?—No, there is no combination; but there is a deep feeling, and a growing feeling, that the time has come when there should be a combination. I have heard it discussed in several recent exhibitions—the last time at Milan. There is a feeling amongst exhibitors that there should be some organisation, some combination. Our own exhibitors are not prepared at present to go to the full length of the French organisation. The French exhibitors fall into line. They pay a certain sum, and they receive so many feet in a show-case. In regard to that show-case, they have little or no voice as to its style—they simply pay and go, whereas, of course, our insular ideas would not permit our manufacturers to fall into line in that fashion right away, but a great deal could be done even in that direction.

1636. Would you go so far as to say that, unless there is greater combination among manufacturers, State organisation would be very greatly hampered?—Yes. Unless, of course, there was some State arrangement which would provide the machinery and the continuity, and represent the matter in such a manner as the exhibitors could understand and put themselves in sympathy with immediately.

1637. You are clear, I understand, that if the Government wishes to spend money for the direct purpose of encouraging trade, participation officially in exhibitions is the best way of doing it?—That is my opinion.

1638. You attach the more importance to that?—Yes, I attach a great deal of importance to that.

1639. Do you think it is the best way of encouraging trade?—I know of no better.

1640. Do you think public money is more usefully spent in that direction than, say, in the employment of commercial *attachés*?—Yes, undoubtedly.

1641. And in getting commercial information, and making it available?—Undoubtedly.

1642. (*Mr. Waring.*) What has been your experience with regard to the point of the difficulty in getting exhibitors to exhibit? Has it been greater of later years than it was in former years?—Yes, much greater. I attribute much of that to the want of continuity. Take an exhibition like Paris, where space was free, but the exhibitors had to pay their own expenses. At the next exhibition they may have to pay for space, and then they will say, "Why should I pay for space, seeing I did not have to pay at Paris?" Then comes the St. Louis Exhibition, where they did not have to put their hands into their pockets at all, and naturally at the next exhibition the work is infinitely harder.

1643. Has the fact that there has been keener competition by the manufacturers of other countries, and the fact that the manufacturers of other countries have had support from their Governments, affected the position at all of recent years? Has that influenced the fact that we do not get such a strong position proportionately in exhibitions of recent years as we did in the past?—I think there is something in that. Some of the countries, notably Germany, spare no pains or expense to make an overwhelming exhibit, and some exhibitors, I think, have been deterred by that fact. On the other hand, I generally find that if the expense of exhibiting is not too great, and if an exhibitor finds that he is going to have fair treatment, and that he can get the amount of space that he requires in many trades, especially in those that I have been speaking of, they are just as ready to go as ever.

1644. Have you ever heard any statement by an exhi-

Mr. T. Cope.

25 Jan. 1907.

bitor that the trouble and the cost of exhibiting were so great that he had made up his mind that he would not exhibit again?—Yes, and no. Of course, at the latter part of any exhibition there is always a certain amount of grumbling, but very often those who grumble most are the first to put their names down for the next exhibition.

1645. You were saying that there has not been that ease of communication and agreeability on the part of the powers that control the exhibition to help people along which you think that there should be?—That is so.

1646. Has that been to a marked degree?—Sometimes.

1647. Is that because there is too much officialism, or how would you describe it?—With the Royal Commission there is too much officialism in various ways, not only in the preliminary stages. Then take the case of the awards. I tried on a certain occasion to get into touch with some of the members of the jury, and I was told it was a most improper request on my part to know who was the British representative in a certain class. I was treated almost as though it was assumed that I was going to offer him half-a-guinea to give me his vote. My object was to place in his hands certain specifications, certain detailed information, which it was hardly possible that he could possess of his own knowledge. There, again, I think there has been a great deal too much officialism. I am speaking of the Paris Exhibition of 1900. I think that the officialism from start to finish of that exhibition did a great deal of harm. I am facing one gentleman who will excuse me for speaking of him. Sir Isidore Spielmann gave us a very great deal of assistance, and threw himself into the breach at a very important time. I am not referring to anything which came into his scope.

1648. Was it to the effect that in giving information, or in helping you, they were practically conferring a favour?—Yes.

1649. It was not done in a business spirit—we are delighted to help you, we are here at your service. and we are anxious to facilitate you in every way we possibly can?—There was nothing of that.

1650. But the opposite?—Those to whom one had access knew nothing, and would not help. A few who had the experience had not the power to make use of it.

1651. Practically, there was an atmosphere that you could not get through?—Yes. I say that a goodly number of high-class exhibitors, who did not take part in the Paris Exhibition, would have gone had it not been for the officialism which kept them out.

1652. Consequently, you think that in the future there should be as little officialism as possible?—Certainly.

1653. That has been a great difficulty in facilitating exhibitions from the English standpoint?—I think so.

1654. Have you formed any impression from the point of view of financial help as to what the nature of it should be—whether it should be directed, as you have a little while back said, to facilitate matters on the spot, or whether there should be a financial grant to the exhibitor to help him towards his expenses?—That, of course, is a question that requires to be dealt with with a great deal of tact and knowledge of the affair. If I found that a certain exhibitor would make a splendid display of some manufacture—take, for example, machinery—and if I found that with the addition of a certain percentage of extra space that firm could make a much better display, I would increase their space, or I would give them a reduced rate for all space taken over a certain figure.

1655. You would make it an elastic point, depending on the individual factor?—Yes. I consider that if an exhibitor is disposed to take part in an exhibition, as was just now said, he should do so at his own expense. There are various ways in which the exhibitor could be helped, and that is one. If an exhibit would be better displayed by a few extra feet being thrown into a gangway, I should not ask him to pay for that if it was a general improvement. There is also the question of the suitable decoration of the section.

1656. Am I right in assuming that your impression is that there is a two-fold aspect in the question; first, there is the national one of the effect which the industry has upon the nation, and the effect of bringing the nation's goods in a national aspect to the front, and, secondly, there is the effect on the individual himself who is exhibiting?—There are those points.

1657. There is duality, in fact?—There is undoubtedly a duality. And the spending of the money must be governed by a proper consideration of those two sides to the question.

1658. Have you formed any idea on the question of a collective exhibit as against an individual exhibit?—A collective exhibit in many instances is good. I have the recollection of a very excellent one made at Brussels by the Cleveland Iron Masters' Association. They made a very fine exhibit. Then the Leeds Chamber of Commerce made a collective exhibit of cloth. In many instances, I think a collective exhibit is to be encouraged. There again is scope for the use of some portion of a Government grant.

1659. Are you thinking of a collective exhibit as regards a specific industry?—Yes, as regards any particular industry. It may be necessary to spend a certain amount of money for the proper display of a collective exhibit. When there is an individual exhibit, the exhibitor has his own show case, or he can hire at a limited expense a show case suitable for his display. But if he takes part in a collective exhibit and pays a proportion of the expenses, there is no asset at the end of the exhibition. It would be, I think, quite legitimate to use a portion of the grant in forming these collective exhibits.

1660. Would you apply that to the classification of an industry only, and not to the whole exhibition? I mean this: Would you advocate the policy of encouraging individual manufacturers, and also the adoption of collective exhibits?—Yes. Of course, each instance would have to be considered entirely upon its merits.

1661. You would not do away with individual exhibits?—By no means.

1662. You are quite clear on that point?—Yes. I think you would destroy, up to a certain point, the utility of the British section if you were to.

1663. (*Sir Isidore Spielmann.*) In the *précis* of your evidence, you refer to gentlemen who have been appointed to represent this country without any previous knowledge of the subject, openly expressing their regret, almost from the commencement, that they had undertaken the position, and only earnestly waiting for the end; would you kindly tell us which exhibitions you are there referring to?—I am referring particularly to the Antwerp and Milan Exhibitions.

1664. Speaking generally, at which exhibitions have the British sections been most successful—at those organised by Royal Commissions, or at those organised by the London Chamber of Commerce?—Leaving always St. Louis out of the question—I had not the pleasure of seeing St. Louis, but judging from my knowledge of the exhibits which this country sent there, I must leave it entirely out of the question, because that was exceptional—I consider the best display of recent years was made at Brussels.

1665. In 1897?—Yes. The display was better there, and the arrangement was better. We had our own section there, whereas in Paris the British exhibits were scattered all over the building. It has been very much the same in Milan. I think better results might be obtained if the work was put in hand earlier, and the local authorities were fought for certain better conditions.

1666. I think I am right in saying that the most recent exhibitions which have been promoted by the London Chamber of Commerce have been those at Brussels, Liège, and Milan?—Yes; but then the London Chamber of Commerce practically withdrew from Liège at the same time as I did, so that must be left out. That exhibition was really run by the Liège Executive Committee.

1667. In your opinion, has the London Chamber of Commerce sufficient influence to induce important firms to participate?—You know I am a member of the committee, and you are a member of the committee yourself, I think.

1668. I am?—My answer to your question is no.

1669. And you do not think it could exercise influence?—I do not think so. It is good up to a certain point. But London does not represent the manufacturers of Great Britain, and therefore I am of opinion that there should be a wider organisation,

embracing the manufacturers of the remainder of the kingdom, as well as the provincial Chambers of Commerce.

1670. Taking the Brussels Exhibition, you say you think that the British section was a success?—Yes.

1671. I think you said that the object of exhibitions is to improve trade. At the Brussels Exhibition, if you set apart the Art collection, which is said to have been good, and the collection of ship models, what was there at Brussels which constituted a success?—My remarks must be taken as more general than that. Unfortunately, at Brussels we had not a good machinery section. We could not get space for machinery, and we were very badly represented. Therefore, my remarks must be taken more generally, because whereas Brussels failed altogether, so far as machinery was concerned, Paris was a great success in that department.

1672. Setting on one side those two strong sections—the collection of ship models and the collection of British Art—can it fairly be said that the British section at Brussels was a success?—I think so. I cannot give you many figures to prove that certain trades did succeed, but I know very well that that exhibition was extremely useful, so far as the Staffordshire pottery trade is concerned, in certain branches of iron manufactures, and in the bedstead trade. Speaking from memory, there were two or three firms who exhibited there, and had practically show rooms in various branches of iron manufactures, who did business arising from the Brussels Exhibition.

1673. But taking the whole of the British industrial section, was it not more of a failure than of a success? I have here a copy of "The Times" of July 29, 1897, and, with the consent of the Chairman, I will read a few words from it with reference to the industrial section. "Before speaking of the Fine Art Department, and especially of the British Section of it, I may touch very briefly upon the General Industrial Department, which is, of course, in the eyes of the organisers and the general public, of most importance. Here the success is very varied, for while two countries"—Belgium and France—"are remarkable, the rest (including England) are but poorly represented. From Belgium, of course, one expects a great deal on such an occasion, and the show is large and good. . . . But though there is little originality, there are taste and good workmanship, offering what to the English visitor is rather a painful contrast to much of what is to be seen in the British section." Then he refers to the French section, and winds up by saying in reference to the French section, "Hence the delightful *coup d'œil* of the whole section, whereas our own is, if the truth must be told, ugly, unsystematic, and unattractive. Again, the best French firms are exhibitors; with us, whether in furniture or in the precious metals and jewels, the best houses seem to abstain." That does not read very much like a success, does it?—No. I have a volume of newspaper cuttings relative to Brussels, and of course one can get a great many opinions from them. I think that rather illustrates my view, because, of course, the grant at Brussels was very small, and there was no possibility of spending the money to greater advantage to get more exhibitors in the time at our disposal.

1674. You returned some out of the grant for Brussels?—Yes, £800; but seeing that it was necessary to keep a safe margin in hand for working expenses, I do not think that was a large amount to return. If there had been a few more thousands to spend, much more could have been done. That article speaks of the unfavourable contrast to Great Britain. We all know that the contrast is unfavourable to our country. The French are mentioned there, but then the French have their splendid organisation.

1675. I read this to show that the best British firms abstained from exhibiting?—There were some of the best at Brussels, but not nearly so many as one would have liked to have seen there. That, I think, emphasises the necessity for a better organisation on our part. Speaking from memory, I think the French have something like 1,500 members of their permanent organisation.

1676. Turning again to Liège, I believe I am right in saying that the London Chamber of Commerce issued a very large number of circular letters inviting the most important Anglo-Belgian firms in the City of London to form a guarantee fund and to subscribe?—Yes.

1677. To that circular letter they had practically few, if any, replies?—Yes, that is perfectly true. *Mr. T. Cope.* 25 Jan. 1907.

1678. Consequently, it does not look as if the Exhibitions Committee of the London Chamber of Commerce had sufficient influence to induce important firms to exhibit?—No, and I never suggested that it has that influence. I do not look upon the Exhibitions Committee of the London Chamber of Commerce as an ideal body, by any means, nor would such a committee ever answer the full purpose. In forming a committee in connection with such a body, Mr. So-and-So's name has to be put down; he may have done good service ten years ago or twenty years ago, and he may be an excellent man to be on a general committee, but he has no knowledge of exhibition matters, and therefore he takes no interest in it himself. You know very well how very few members attend those meetings, and how very few take any interest whatever in them.

1679. A previous witness told us that he considered the British section at the Liège Exhibition a success; but you could not endorse that statement, I gather?—No.

1680. As regards the Milan Exhibition, would you call the British section there a success or a failure?—I should not call it a success. It was not one which I think anybody who has been there can feel proud of, excepting the ship models, which always do most excellent service. There, again, I say of the Milan Exhibition that the same want of continuity—the same want of continuous knowledge—has proved fatal. You could go there into the so-called Decorative Arts Section, and what did you find? You found a Turk, a German, and people of other nationalities, selling twisted wire and enamelled brooches, German hardware, Swiss moonstone jewellery, and odds and ends of every description. All those people that are known in exhibition parlance as "fakers," everyone of them, were kept out of Brussels, and they were kept out of Paris; but in Milan they were present in numbers. Certainly, each one adds one name to the catalogue, and one will be able to say presently that so many British firms took part in the exhibition. But I say that exhibitors like those are a disgrace to any British section. They constitute themselves British subjects nominally by having an address in London or elsewhere, and they go under various names.

1681. You have referred to two grants of £5,000; do you consider such grants are ample to organise British sections? Surely that would not be so in the case of Royal Commissions? I suppose you were alluding then to the London Chamber of Commerce?—So much must depend upon the city where the exhibition is being held. I do not believe that we should rush into participation in any foreign exhibition, but £5,000 would be a good medium figure for a grant; but, of course, as you say, not for a Royal Commission. So much depends upon the lines that the Royal Commission would work upon. If money is going to be spent lavishly, £5,000 would go no way on the road to success. I should say that a grant of from £5,000 to £10,000 would be sufficient for an ordinary exhibition.

1682. In mentioning these figures you do not include Art, of course?—No, I should leave Art entirely out of the question.

1683. (*Mr. Algernon Law.*) You said that at the exhibition of St. Louis the British section was a success; do you know of any good result to British trade that has followed from it?—No, I have not heard of any. I ought to say that I have not sought to obtain any information on the subject.

1684. In a case of that sort what do you think is the outside sum that ought to be spent?—I have always understood that taking part in that was a political consideration, and I do not think any figure could be named.

1685. You have referred to the absence of a knowledge of French in the case of some of the officials; could you say at what exhibition that was?—I would rather not go into details, as I think it would not be quite fair; but I have seen instances where people have had no knowledge of the language of the country in which the exhibition has been held, although that has been essential to the carrying on of the business.

1686. What do you think is the main cause of the failure at Milan?—The impossible conditions. We accepted blindly all the conditions laid down by a collection of individuals who formed the committee at Milan, none of whom had any previous experience of

Mr. T. Cope.
25 Jan. 1907.

exhibition work. They had framed a set of impossible conditions, and I attribute much of the want of success to the unsatisfactory nature of those conditions, and to a blind acquiescence in all the conditions laid down. A better acquaintance with the subject would have avoided all that.

1687. (*Mr. Wilson Fox.*) I understood you to say you had found the British exhibit at Brussels the greatest success of any British exhibit you had seen at any exhibition of recent years?—I look upon the lines of the British section at Brussels as the nearest to the ideal that we have had.

1688. But after listening to the article which Sir Isidore Spielmann read out of "The Times," we cannot say that that is putting the level very high, can we?—It is putting it about as high as it could be, because we compared so very badly.

1689. I am not talking about the comparison; I am looking at the exhibit at Brussels from the point of view of whether we are satisfied that that exhibit fairly represented Great Britain. Do you say that the Brussels exhibit was a satisfactory one from that point of view, to begin with?—From that point of view, yes. Of course, you must draw a wide line between Paris and any other city.

1690. I am taking what you said about Brussels; is Brussels your ideal of what a British exhibit should be?—It is the best we have had in any recent Continental exhibition; but then we have not had many.

1691. That is not quite what I was asking. Do you think that the British nation could fairly have been satisfied with that exhibit if they had all seen it?—No; no more than they would have been satisfied with any participation under similar conditions.

1692. I am only taking your standard of comparison. You say that the Brussels exhibit was the best?—The best we have made.

1693. I only want to know whether in itself it was a fairly good one, or a fairly moderate one, or a fairly bad one?—It was a fairly good one, but by no means coming up to my ideal of what a British section should be.

1694. That is what I wanted to ascertain. You have been to a great many exhibitions and seen a great many British exhibits; can you tell me at which exhibition that you have visited you consider there was a really representative commercial British exhibit?—The two Paris exhibitions, of course, have been the very best, because you will always find more manufacturers willing to exhibit in Paris than in any other city.

1695. I want to know at which exhibition you think there was a really representative British commercial exhibit?—I can only say again that there has been nothing better than Brussels of recent years. The number to compare with is so very limited—you have had exhibitions at Brussels, Milan, Antwerp, Liège and Amsterdam; there has been nothing else.

1696. You say Brussels is the best, but what I am wanting to ascertain really is whether you think that at any of those exhibitions it could be said that British commerce was properly represented?—No; and that is why, if we are going to continue to participate, I say that we should organise ourselves upon some such lines as have been adopted in France.

1697. In existing circumstances, if a firm has applied to exhibit at the exhibitions in which you have taken part, could that firm exhibit when it has got something to show, whether it was good, bad or indifferent? Is there any control exercised?—Generally speaking and on broad lines, yes, there is.

1698. Who exercises that control?—The exhibitor has to send in, roughly, a specification of what he is going to exhibit, and sometimes he has to send in a photograph or sketch of what he proposes to exhibit.

1699. In fact, do you find that many firms have been refused permission to exhibit at an exhibition on the ground that their proposed exhibit was not desirable?—Yes.

1700. You have found that?—Yes.

1701. A large proportion?—A good number. Many of the applications come from firms such as I instanced just now, which should have no place whatever in a British section.

1702. Then there is at present some selection?—Undoubtedly. For Liège I did not pass a single application until I satisfied myself that it was a fit and proper exhibit.

1703. On the point of what you said about having more organisation, do you think with reference to collective exhibits that a British manufacturer or trader would care to have the exhibit he sends to an exhibition arranged by anybody else but a member of his own firm, or a representative of his firm?—Of course, you know that a great deal of the installation is carried out by agents.

1704. Do you think that a British firm would care to send a large exhibit and to have the whole arrangement of it put into the hands of a committee nominated by a Royal Commission, or whatever body is responsible for getting it to the exhibition?—No; and I do not see why they should. I think it should be mutual. Of course, a committee should have considerable powers in saying how it should be arranged, but every trader should have, and must have, a better knowledge of how his goods should be displayed, and I think therefore the exhibitor's views should have considerable weight.

1705. He would wish to show from the point of view of his firm what his firm could best produce?—Yes.

1706. But the central committee might want to show what goods of that particular class Great Britain can produce, and their idea of the arrangement of the whole might be to take the exhibits sent up by ten firms and showing those goods all together, and that might be a very different arrangement to that which the ten firms might themselves individually prefer?—I think that would be a matter of very easy arrangement.

1707. You do not think there would be any difficulty about that, then?—I think there would be no difficulty about that.

1708. You think there would be no danger of the firms who are showing having their individuality swamped?—No; I think it is a matter which could be easily arranged.

1709. Would you say that individual firms would consider that a very important point?—Yes; and, of course, I should only advocate grouping under certain circumstances.

Mr. William Burton, called, and examined.

Mr. W. Burton.

1710. (*Chairman.*) Can you give us the name of your firm?—Pilkington's Tile and Pottery Company, Ltd., Clifton Junction, near Manchester,

1711. Is that the firm which deals in glass, too?—No. My partners are brothers to the glass people.

1712. Have you had some experience in exhibiting?—Yes. We exhibited at Paris in 1900, at Liège in 1905, and at Milan this last year. We have also exhibited in our own country at Glasgow, Wolverhampton, and Manchester; but those exhibitions were not quite in the same category as the others.

1713. What is your opinion as regards securing first class exhibits for such exhibitions?—My own opinion is that in connection with most of the recent exhibitions the British Commissioner or Commissioners, whoever they have been, have hardly approached the leading firms in our industry—that is, the pottery industry. I may say that although my works are in Manchester, I am intimately connected with the leading manufacturers in the Staffordshire Potteries. I am an active member of the Joint Committee of the Pottery Manufacturers, and I have discussed this matter with firms like Mintons, Doultons, Ridgeways, and so on. We are all of opinion that if it is considered necessary or advisable that British manufacturers should be represented at international exhibitions abroad, surely it is imperative that steps should be taken to ensure the co-operation or to enlist the sympathy of all the best firms in the trade. When the Glasgow Exhibition was being organised, one of the leading potters in Glasgow was on the committee—Sir James Fleming, who is the head of the firm of Cochrane and Fleming. He wrote round himself to all the principal pottery manufacturers he knew, bringing his personal influence to bear, and pointing

out to them the advantages to be derived from exhibiting their wares in Glasgow. Had such a course been pursued, we will say at Milan, this last year, or had the Commissioner deputed somebody who knew something about the subject to go down to Stoke-on-Trent, and so on, and address a meeting of the Chamber of Commerce there, pointing out the commercial advantages to be derived by our district by increasing our trade with North Italy, I am quite sure that a better representation of our trade, at all events, could have been secured.

1714. I suppose you received circulars or letters asking you to exhibit?—Certainly we received circulars; and usually, I am afraid, a circular like that generally finds its way into the wastepaper basket. I know it did in my own case, simply because it did not tell me anything. There was a circular which I read carefully, but it did not appeal to me at all; the thing was not put to me really. As a matter of fact, if I had not been approached afterwards by an exhibition agent, who pointed out the advantages that he could see to British trade that would accrue from this exhibition in Milan, I would not have exhibited.

1715. Could not that have been put in the circular?—Possibly. I do not say that it could not; but I think it could have been done better the other way.

1716. Leaving out the smaller ones, were you asked by the Royal Commission to exhibit in Paris in 1900?—I cannot recollect now whether we were asked to exhibit or whether we asked to be allowed to exhibit there; but that is immaterial, for I dare say we got the circular.

1717. Anyhow, the proper steps, you think, are not taken to secure the best exhibits?—I think so.

1718. And you think it could be done by somebody going round to the industries?—If somebody were deputed to visit the leading towns where applied-art manufactures are carried on, such as, for instance, Birmingham, Stoke-on-Trent, Sheffield, Manchester, and so on, and if they would write beforehand to the Chambers of Commerce and say, "Now, will you advise us as to the firms we ought to see or the steps we ought to take to enlist sympathy and interest in your district," it seems to me certainly that that would be a much more practical way of getting at the best firms.

1719. Who are the people who are to make such efforts? Do you attach importance to having a permanent organisation, or would you have a new committee or commission for each exhibition?—I think the French scheme, by which there is a kind of informal committee, recognised by the French Ministry, consisting largely of manufacturers and all those who are in the habit of exhibiting at exhibitions, or something on that line, might surely be adopted in this country.

1720. Do you mean a society of commercial men, and at the same time some official organisation?—Yes; but I think I would reduce the official organisation to the smallest possible limit; the smallest reasonable limit. I think it would be very desirable to have something of the sort.

1721. Then we come to the question of space; had you any difficulties about that?—Yes; I have had considerable difficulties with regard to space, and I know other manufacturers who have had. For instance, there has never been any attempt made, so far as I know from my own experience, to secure that when a manufacturer was allotted space he would arrange his goods in that space in such a way as to be at all in keeping or in harmony with the firms who are exhibiting next to him. I remember very well indeed that in Paris, in 1900, Messrs. Doulton had a very fine exhibit on one side of the main gangway, and Messrs. Waring on the other. Those exhibits, which were quite worthy of our country, were, in my opinion, spoilt by the people next to them being allowed to put up erections which the American Commissioner described to me as hen-coops. There has been exactly the same thing at Milan this year. We erected, at a very considerable expense, a show of tiles, and we exhibited also a number of artistic vases. Next to us, if you please, there was a firm from Leeds who exhibited trousers-stretchers, and, what was far worse, tried to carry on a retail trade, and their attentions were so importunate that they drove all the respectable people right past our exhibit. Of course, ladies would not have such goods, and they shrugged their shoulders and walked away. That is what I refer to.

1722. It required more superintendence by the Committee, do you think?—I think it required much more superintendence by the Committee. When I spoke of this to the different commissioners they said "Yes, but then you British manufacturers are so independent that you will not take advice." Of course we will not take advice unless the advice is tendered in the proper way, and unless we see the sense of it. We must remember how very differently most of the foreign nations are now arranging their exhibits, and how they are making a comprehensive exhibit by the side of ours—probably with the assistance of some well-known architect. I am quite sure that most of our leading manufacturers would be pleased to fall in with such a scheme as far as they could.

1723. As regards assistance, do you expect assistance from the Commission—that is, not towards the expenses of exhibiting, but in other ways?—I was not thinking of assistance towards the expenses. I was rather thinking of the way in which the representatives of other nations—I am now speaking from my own experience—of what I have myself seen—and I do not wish to go beyond that at all——

1724. That is quite right?—I was thinking of the way in which the foreign Commissioners have aided their own people in making their arrangements. I was in Paris myself for seven weeks arranging our exhibit there. I spent the whole of the seven weeks at the Paris Exhibition before it was opened at all, so that I saw what went on. The English section was used, and was allowed to be used, as a thoroughfare for everybody. We were tremendously hampered by strolling people of every kind and from every country. Our workmen's tools were stolen repeatedly, and we were hampered in every way. I spoke to our officials—not to the Commissioner himself, but to his assistants—and we could hardly get any attention, let alone any redress. I suggested that we might be allowed to put a rope round our space. "Oh! dear, no; that would not be allowed at all." Presently the Americans arrived. They had the next space. They brought all their goods in one ship to begin with, and the ship was provided by the Government, and all their things were put down there. Immediately they arrived they roped off their space, and they put at every entrance, where the workmen were admitted, a porter with the United States badge on and with a truncheon in his hand, and they kept everybody out. The Germans did precisely the same. But as for ourselves, I know I was perfectly sorry for Doulton's man, and I wrote over to Messrs. Doulton myself as to the way their man was being humbugged with his work. Our British officials came to me and said, "Oh! please don't make a fuss; don't say anything; it is much better not." Another illustration: Our arrangement at Paris was like this: Wishing to show tiles, we wanted naturally as much wall-space as possible. I first of all arranged with the Commissioners that I was to have a piece of wall about 30 or 40 feet long, and then I was to be allowed to build out a projecting wall, for 9 feet, at right angles to that, which I could tile on both sides. This was all agreed to; I had their plan authorising me to do it and all the rest of it, and I built it up. One day one of the officials came to me and said, "You will have to take that wall down." I said, "What for?" He said, "The French authorities are grumbling at it, because you are blocking out the vista." I said, "No; I think you are making a mistake. If you remember, I arranged this with you personally." It so happened that it was the same man that I had made the arrangement with here in the offices. "Now," I said, "I have got a drawing from you authorising me to have this wall out 9 feet. I have only built it 8ft. 6in. as a matter of fact—I have been so careful to keep absolutely within the regulations." He said, "You will have to take it down." I said, "I won't take it down." He said, "We will knock down the wall"—absolutely. "Very well, then," I said, "do so; but if you do I will bring an action against you." He said, "The French will insist on your taking it down." The next morning it so happened that I saw M. Picard, the French Commissioner-General for the Exhibition, and I stopped him and asked if he knew anything about this, and he said, "Nothing of the kind; it is perfectly in order; we have never said a word."

1725. Was this an assistant, or was it Sir Herbert Jekyll?—It was not Sir Herbert Jekyll, of course.

1726. There was some misunderstanding, certainly?—I do not know.

Mr. W. Burton.

25 Jan. 1907.

1727. Anyhow, did you take that wall down?—Certainly not. I would not have taken it down for anybody.

1728. You did not take it down?—I would not have taken it down for anybody.

1729. So it ended all right?—Of course it ended all right; only that is the kind of thing we have had to put up with. That is the best illustration I can give you of the way in which we have been treated; and knowing how the exhibitors from other countries have been treated, all I say is that the contrast is, simply, one that I cannot understand.

1730. You have already told us about having unworthy exhibits near you?—I would like to say a little more on that, if I may. That was particularly noticeable at Milan this year. I do not wish to blame any individual, but for some reason or another the Commission, we will say, got it into their heads that they were not going to receive a sufficient amount of support from important manufacturers. I suppose they received no reply to their circular, and they did not see their way to interesting people sufficiently. I can only assume that it was in that way that firms were allowed to exhibit in the British section of decorative art who were a positive disgrace to the British name. I may tell you that this class of firm are known to regular attendants at exhibitions as "fakers."

1731. We have had evidence about fakers before?—There were at least a dozen firms showing there who ought not to have been allowed to exhibit at all. I saw, myself, free fights between their attendants going on. I saw a glass case smashed by a man throwing a stool at a woman—they were the two attendants of one of these firms. The whole thing was disgraceful; it was a perfect turmoil.

1732. I think we can take that from you?—Then I need not say any more about it.

1733. Have you anything to tell us about the question of awards at exhibitions? Are you satisfied with the system that generally prevails?—I do not know that it is altogether satisfactory, but at the same time I do not see how it can be very much improved upon.

1734. You would not do away with awards?—Well, I have never thought of that. I should be inclined to have them. Most people would prefer that they were not done away with, though personally I think it might be a very good thing if they were done away with.

1735. But you think most people attach importance to them?—I think most people do attach importance to them from a commercial point of view—certainly most people in our trade.

1736. From what you have already said, I gather that you prefer the organisation and arrangements of the chief foreign countries at these exhibitions to our own?—Yes, especially those of some nations. I think the French are now rather over-doing it; I mean that they organise the thing altogether too much. In their effort for uniformity, and in their attempt to secure something like unity of exhibits, they have reduced it now almost to a series of shop-windows, which I think is by no means desirable. The Germans and the Hungarians have impressed me very much in recent exhibitions, not only by the order and thoroughness with which they have done their work, but by the way in which they have always managed to secure, first of all, an artistic arrangement. Whatever space they have had, somebody has been empowered, I suppose some first-class architect really, to treat their space as a whole, to introduce into it certain decorative features which might or might not be integral parts of the exhibition—generally they were—and he has contrived in the space, no doubt in conjunction with the manufacturers who were exhibiting, to allot spaces to them which would be suitable for the work they had in hand. It was very noteworthy at Paris in 1900, for instance, to pass from the Danish Section, which was quite small but beautifully arranged, through the British Section and the American Section to the German Section. There you had things arranged as a whole on a sort of architectural basis, and that struck you to begin with. Then, of course, you began to see that a lot of these things—the things which you were looking upon as architecture and as skilful arrangement—were really fine exhibits. You said, "Well, that is a fine exhibit." In the same way, the arrangements made by the pottery firm of Zsolnay and Sons, of Hungary, at Milan were admirable. So also were the arrangements by Villeroy and Boch and the Berlin Porcelain Company in Paris in 1900.

1737. Do you think that the large grants made by foreign Governments have helped towards their getting a better representation?—They have undoubtedly helped, because if the Government makes a sufficient grant, and then says, "Now we are going to secure, as we think it is important for the trade of this country that we should secure, an adequate representation of certain branches of commerce, and we are prepared at our expense to provide general architectural supervision and a scheme which you may come into," why, of course, that is very helpful indeed. Then, again, I know that foreign Governments have in many cases paid for the space of the exhibitors. I do not attach much importance to that myself, but it might be a factor with some firms. I think that, as a general rule, in this country it would not be a very considerable factor, but perhaps with the smaller manufacturers in some of the growing countries, like Denmark and Hungary and Belgium and Holland, that has been a consideration. What I rather feel there also is that the grants which have been made by our Government might have been put to very much greater advantage. Of course, I have no information, and I can only go on hearsay, but I understand, for instance, that the grant which was given for Milan, small as it was, has not been used. If that is the case, I think it is very deplorable, because there we distinctly suffered from the parsimony with which things were done. Had the money been expended we should have had a better result. As the money is not expended, I suppose the Treasury will demand the balance to be refunded, and then next time a grant is asked for they will say, You had only £5,000 or £10,000, whatever it was, for Milan, and you did not spend all that, therefore you cannot need all this money.

1738. Have you thought of any remedies for that in organisation?—Either by officials or otherwise? Assuming, of course (as I believe from my own experience, and all I have seen and know about manufacture) that certainly, for many classes of our trade, an adequate representation of what we are doing in this country would be of very great benefit to us; I think it would be an advantage if a society could be formed, of manufacturers primarily, with, I would say, the smallest number of officials possible, but I would like one really first-class official who could act as chairman or convener of the meetings, and so on, so as to avoid any friction or jealousy.

1739. Would you have a Royal Commission for a large exhibition if we were going to take part in it?—If we had such a standing committee as the Germans have, and as the French have, where the manufacturers themselves are much more taken into the confidence of their Government Departments, and are much more consulted—if we had such a standing committee which could be consulted, their opinion as to whether there should be a Royal Commission for any particular exhibition or not, would, I think, be valuable.

1740. Then you would have a permanent standing body, largely composed of commercial people?—When I speak of commercial people, I mean manufacturers, not merely shippers and exporters. To answer your question. Certainly I would!

1741. I suppose your experience has been almost entirely as regards your own goods, which border very much upon art, if they are not actually artistic products?—Certainly. I wish to confine myself entirely to those branches of English manufacture in which applied art plays a very important part, whether it is pottery, or textiles, or what not; because many of our friends in Lancashire naturally are important manufacturers of textiles, and the best-known wall-paper people in this country are also friends of mine. We have talked this thing over at exhibitions, where we have met and discussed our grievances.

1742. And you think you are representing very much their opinion on this matter?—I do think so.

1743. You do not speak very well of your experience with the officials?—Personally the officials have always been most amiable, but at the same time they have never done anything.

1744. They have not helped you as much as they ought?—No, most certainly not. I could get privileges from the Commissioners of other nations far more easily than I could get them from my own—and have done. The Danish Commissioner and the Hungarian

Commissioner have helped me when my own people have refused to do so.

1745. (*Mr. Algernon Law.*) On what ground, generally, would you justify the grant of public money for exhibitions?—On the general ground that if there is no public money granted every manufacturer is a law unto himself, which I consider is a calamity if you are going to exhibit.

1746. Do you consider that it is necessary that the British manufacturer should exhibit?—For certain sections of our trade undoubtedly, and I think particularly for those sections of the trade where art is an important factor. At the present time it is notorious that English taste in matters of applied art is being more and more highly esteemed all over the world, and that our export of goods of this class, especially of goods of fine quality, is being fully maintained, if not increased. Certainly that is so with regard to pottery. It is the cheaper and commoner pottery that is not being exported so largely as it used to be.

1747. Did you exhibit pottery at Brussels?—We did not exhibit at the Brussels Exhibition.

1748. Did you form any opinion as to the Brussels Exhibition?—In what way.

1749. With regard to its general success from a British point of view?—No, I cannot say that I did. I went there really to study what the foreign potters were doing, and I am afraid I did not do anything else.

1750. In the case of Liège, was there a satisfactory result, in your opinion?—I do not think Liège was very satisfactory in itself, but it gave a satisfactory result to us personally. It inclined us to open up some agencies in Belgium which we still retain, and which we never had before.

1751. Did you take part in the St. Louis Exhibition?—No.

1752. Have you heard as to the results from any of your friends who did exhibit in St. Louis?—Yes. Many Staffordshire potters did exhibit at St. Louis, and I have heard them say they had very good results indeed. I am glad you asked me that question, because it brings to my mind a very important point. The men in the pottery trade who profited from the St. Louis Exhibition were the men who established a good commercial organisation there immediately afterwards, or had one already in existence. I may say that what we call in the Potteries the Big Four—the Meakins's, the Johnsons, and the Grindleys—who export the bulk of their ware, and sell little in this country at all, have tremendously fine organisations both in Northern and Southern America, and they can beat the American potter on his own ground, in spite of the 60 per cent. duty. Those men exhibited, and they all profited by it, I know, because we have discussed this question.

1753. Do you consider then that an exhibition is the best form of advertisement?—It is a very good form of advertisement; but, as I have just said, I think, as an advertisement, it is all right, but it must be followed up on the manufacturers' part afterwards by commercial work.

1754. Have you formed any opinion as to whether all the exhibits in a British section should be collective exhibits, taking pottery, for instance, or whether every exhibitor should be allowed to have his own show? Would you have it all collected together and arranged as the exhibit of a district or a country?—I think every exhibitor should have his own show, but at the same time I think some advice or supervision should be given as to what is shown. I would treat them very carefully, because I do not want to spoil the individuality of any manufacturer. We were asked to take part in a collective show at St. Louis, and I declined, and, as I think, I generally should decline unless the collective exhibit was one of exactly the same class of goods as I was manufacturing. For instance, I declined at St. Louis to have anything to do with it, because there were some tile manufacturers showing there whose tiles are not in the same class as ours at all, and I declined to be associated with them—that is all. They are men who make inferior stuff. Of course, they have just as much right to show as I have from that point of view, only as long as I am a free agent I will not show with them.

1755. Have you formed any opinion what the amount of the grant should be for British participation in an exhibition at a place like Milan; or have you not formed any opinion?—I have formed no definite opinion.

1756. Or as to the utility of having a fine pavilion and spending a great deal of money on that as an exhibit of the country, as it were? Do you think that assists the individual exhibitor, from the point of view of his exhibit, and having regard to the commercial result to be obtained from his exhibiting?—I do, undoubtedly. Think, for instance, of what Hungary gained by their pavilion at Milan, which was unfortunately destroyed afterwards, and rebuilt on a smaller scale. Then Belgium gained at Milan by their excellent reproduction of one of the old Flemish town halls. I know that when I was in Milan those two things were the attractions of the Exhibition, apart altogether from what they contained. I remember, and no doubt most of you gentlemen remember, that there was hardly any building connected with the Paris Exhibition of 1900 which attracted more attention than the English pavilion on the banks of the Seine, which was of course a part of our display, though it was the official headquarters.

1757. The last time we met we were told by a witness that the British pavilion at Paris was looked upon by people as a sort of rabbit-hutch when compared with all the others?—By what kind of people?

1758. Of course that was only an observation?—I can give you the evidence of the sort of men I am speaking about who appreciated that place and thought it was a very striking thing. There was such a man as M. Benedite, the Conservator of the Musée Luxembourg, and M. Georges Vogt, who is one of the chief officials of the Sèvres Porcelain Works, and men of that type, men who were competent to express an opinion.

1759. (*Sir Isidore Spielmann.*) Perhaps they were referring to the interior rather than to the exterior?—To both. The interior certainly charmed them, and the exterior also. They thought it was so simple as compared with the grandiose swagger of the German palace particularly. No doubt to the inartistic person the German palace seemed to be much more important and much more beautifully built; but that was not the opinion of anybody who was really artistic.

1760. When you say you object to collective exhibits, I suppose you allude to pottery more particularly—you object to them for pottery?—I am not quite clear about the question of collective exhibits, and I should like to ask a question myself, if I may. Are you referring to the sort of collective exhibit that has been organised at several exhibitions by the Arts and Crafts Exhibition Society?

1761. No; I am referring to a number of firms manufacturing the same thing exhibiting together, and a choice made from their choicest things?—If the manufacturers are agreeable, certainly.

1762. Would you object, for instance, to participate in a collective exhibit with Doultons and Mintons?—Certainly not—not for a moment. If the firms were of our class, of course I would not object.

1763. I believe Doultons and Mintons exhibited very largely at St. Louis, and had very handsome exhibits?—Yes, they did have very handsome exhibits, but they did not go as a collective exhibit, did they?

1764. They went separately; yet you would not go there?—Our own individual business with that section of America was not sufficient to warrant us in exhibiting there. If there was an exhibition, for instance, at Chicago, or at Toronto, or at Boston, or at New York, I should probably exhibit gladly, because there I have already a trade.

1765. Does your firm often decline to exhibit?—St. Louis was the only time we have declined.

1766. I believe I am right in saying that Messrs. Doulton and Messrs. Minton always exhibit at International exhibitions?—Not Messrs. Minton. Messrs. Minton did not exhibit in Paris in 1900, but I think that was the first time they missed.

1767. At the exhibitions at Paris, Liège, and Milan, to which you refer, what awards did your firm take?—At Paris I think we got two gold medals and two silver ones, or something like that. At Liège we got a gold medal; we only exhibited pottery at Liège. At Milan we got a *grand prix*.

1768. Do you regard those awards as being very useful to you in trade?—I think they are of some use,

Mr. W. Burton.

25 Jan. 1907.

but not very useful. I do not think they are nearly as useful as they were 20 years ago.

1769. Did you take orders at these three exhibitions?—Yes.

1770. To which do you attach more importance—getting a very high award like the *grand prix*, or getting orders?—Getting orders certainly, especially if, as any business man would, he followed his orders up by trying to develop them into a steady trade.

1771. May I put it this way? Would you rather take a *grand prix* at an exhibition than very moderate orders?—I would rather take the *grand prix*, then.

1772. (*Mr. Wilson Fox.*) Why are these awards not so valuable now as they were 20 years ago?—I think they are not so valuable now as they were 20 years ago because people nowadays, I mean the general purchasing public, are inclined to think that they know a great deal more than they were inclined to think they knew 20 years ago, and they attach less importance to the opinion of other people. They prefer to go by what they themselves see.

1773. (*Sir Isidore Spielmann.*) Whenever you take medals, do not the artists who work for your firm get awards also as collaborateurs?—Certainly.

1774. They did at the Paris Exhibition, did they not?—Certainly. At the Paris Exhibition both Walter Crane and Lewis Day got separate medals for the things they had done for us.

1775. (*Mr. Waring.*) Do I understand that you are clearly in favour of exhibitions—you are quite clear on the point that they are of definite value to the British manufacturer?—I think so, in certain trades.

1776. Your mind is quite clear on that point?—Quite clear.

1777. From the evidence we have heard just now, apparently you have great doubts about the methods of conducting, supervising, and administering exhibitions in the past, from a British standpoint?—I have no doubt at all. I am very disappointed with it. I thought it was inefficient, as I have said.

1778. Would you say there was grave inefficiency?—Yes, grave inefficiency.

1779. What would you attribute it to? Would you call it officialism? For example, in regard to information, had you any difficulty in getting it, or could you get it with ease?—We had a difficulty in getting information always. I should say there was a want of commercial training in the men who are connected with the exhibitions as Commissioners and assistants.

1780. Practically it was officialism?—Yes. I do not like to use that word harshly, but I think that that is practically so. I think we agree there.

1781. The next point I want to put to you is that from lack of national support possibly, I take it your impression is that we suffered very much, as regards comparison with other countries; and instead of Great Britain being in the front and having the most effective exhibit, do I understand from you that you consider it was in the end the least effective?—I consider that at Paris in 1900 we had the least effective exhibit of any nation in Europe. I am perfectly certain that hundreds of people walked past your exhibit and Messrs. Doulton's; and besides that, they never realised they were in the British section at all. They walked from the Danish section to the American section, and apart from that they thought there was nothing to see.

1782. Is it your impression that that is the position where the Government should come in and help—that it should be architectural, and a complete effective exhibit from the national standpoint, in the way that the exhibits of Germany, Austria, and the other countries are?—Certainly. I feel that most emphatically; otherwise I think myself that it is absolutely no use going on as we are going on, and that we had far better give it up altogether. Really it has become so ludicrous for us as a nation to be represented by the kind of shows we have had at recent exhibitions, that I would far rather see it done away with if that is all we can do. I think it would be a scandal, though, that such a thing should happen.

1783. Do you think, in point of comparison, it would seem that we are a degenerate nation rather than one making headway against other countries?—No impartial outsider could have seen our exhibits at these exhibitions without feeling—well, if that is all England can do, or if that is the best England can do, then good-bye to England.

1784. So you are quite clear (1) that it is a good thing to have these exhibitions, and (2) that it is imperative, if they are to go on, that we should have better support and better administration?—Absolutely.

1785. Have you any impression with regard to the feeling that existed between France and Great Britain during the Exhibition of 1900, owing to the lack of the *entente cordiale*?—That, of course, was alleged by the officials in reply to my remonstrances. They said, "We are so disliked here," and all the rest of it. "You know what is going on. I should not say anything about it. You had better keep quiet. You had better not press for this, that, and the other." But I thought it was a monstrous injustice both to us and to the French. I was in Paris, as I tell you, over seven weeks supervising our exhibits. I was there altogether three months, and from all the official and all the common people, and everybody else I met, I never received anything but the utmost friendliness and kindliness.

1786. So that you think the feeling you experienced personally with regard to those of our representatives with whom you had to come in contact, and with regard to their manners and their methods, is that those manners and those methods did not help the situation with the French element?—I am sure they did not.

1787. The manners and the methods did not help?—No.

1788. (*Mr. Malcolm Ramsay.*) You began your evidence by saying that if British manufacturers wanted to be represented at exhibitions, certain things ought to be done; what we want to know really is, whether manufacturers do generally wish to be represented at exhibitions?—I think there has been undoubtedly a growing feeling among certain manufacturers that they have been quite sufficiently represented at exhibitions.

1789. Quite sufficiently, do you say?—Yes; in the past I mean. For instance, a few years ago I know that the firm of Mintons rather thought that they had got all that they could ever get in the shape of reputation by exhibitions, and they decided they would not exhibit any more; but I do not think that would be their attitude to-day. On the other hand, we have got a great firm like Doultons—I must confine myself to my own trade, because, of course, I know most about it—and we know that Messrs. Doulton have consistently exhibited, and I cannot conceive that an able business man like the late Sir Henry Doulton would have gone on exhibiting if he had not found the benefit of it. Of course, you have also to remember the position of firms, like my own, which have not all this old-established reputation. There are always new firms coming up who are anxious to have a chance. I know perfectly well that if I were given the chance I could make an exhibit equal to anything; but I would not like to say that I was disappointed in 1900 when the British Commissioners allotted to me what I considered a very inadequate space. In the circumstances then, I could not be disappointed, but if they did it now, the position would be so different that I should be disappointed, and I should say something about it. You must always remember that every five or ten years, in our trade at all events, some firms that were at first either not in existence at all, or if they were were only just getting on their legs, have become real factors in the trade; while some of the old firms will not now be so important as they were 20 or 30 years ago. So that if some of the old firms tell you, "I do not intend to exhibit any more," that should only be taken, I think, as representing their individual view, as there may be somebody else coming on who is most anxious to take the place that those celebrated firms occupied 20 years ago.

1790. As far as regards your trade, you think that exhibitions are a good means of advertisement, do you not?—Certainly.

1791. And you approach the question from the point of view of advertisement, do you not?—Yes.

1792. Whether the benefit results directly in the shape of immediate orders, or indirectly in the shape of subsequent orders?—Yes, partly for that reason; or as, for instance, happened to us at Milan. When we were awarded the *grand prix* at Milan we received inquiries from first-class houses, giving us very good

trade references, from Nice, from Hyères, from Florence, from Rome, and from Naples—firms that we might have spent years in trying to get at in towns where we might have sent a traveller for years and never discovered them, or never got anything out of them at all. Merely because they had seen our exhibit, and had found that we had been awarded the *grand prix*, and because they liked our stuff, they themselves opened up negotiations with us, and we have been able, through that, to open important agencies in all those places.

1793. That is a question I wish to ask you, whether you consider for your own business an international exhibition is a better means of pushing trade than your own private enterprise?—Our own private enterprise will do a great deal, but an international exhibition will supplement private enterprise, or will originate it even. After all, in an international exhibition you have two advantages: you have the advantage first of all of bringing your goods directly before the dealer, and you have also the advantage of bringing your goods more or less directly before the consumer. I send a traveller to Germany and all round Europe every year, and sometimes I go myself. If I go myself I can be sure of seeing the principal of the firm; he will see me, because I am a principal in my firm. But if I send a traveller he very seldom will see my traveller, and my traveller has to see his salesman, or his buyer, or his somebody else. This particular buyer may not like my goods, and he may say, "No, thank you, it is no good to us at all." Whereas if the principal—who is, I think I may say, taking it generally, a more cultured man, and knows better probably than his subordinate—saw those things, he might say, "Yes, I like those things very much, and I will buy them." Then in an exhibition you have the public coming, and if they are very much taken with what they have seen at the exhibition, then, of course, they go to the people with whom they are in the habit of doing trade, and say, "You know at our exhibition we saw some stuff made by a firm named So-and-so; have you got anything like it?" If that is repeated often enough, then, of course, it comes round to you, and the firms begin to say, "I want to see some of your stuff." I know the managing director of the Copenhagen Royal Porcelain Works, who is a very good friend of mine. He has been to my place, and we have talked over that question. The previous director was his father-in-law, who was a senator, and a very able man. Both these managing directors have said to me that the Copenhagen Royal Porcelain Works, which is to-day one of the most successful of the porcelain works in Europe, would never have built itself up in the time it has done had it not been for international exhibitions. An international exhibition, precisely in the way I have indicated, enabled them to break ground in a new place. They always got a good award, and their exhibit was always of a very interesting character, so that they found somebody in the place where the exhibition was held—the best house in the town probably, or one of the best houses in the town—anxious to become their agents. I know that is how they built up their trade. The success of the Copenhagen porcelain industry is almost phenomenal, considering that a few years ago Copenhagen porcelain was unknown.

1794. I think you said you declined to go to St. Louis, did you not?—Yes.

1795. On the ground that you would be showing goods against firms that were not of your own standing?—Not merely against, but in conjunction with.

1796. Do you find that second or third class firms are keen to go to exhibitions?—Of course, occasionally even a second or third class firm is bitten with a very laudable ambition to do something better, possibly to get an award at an exhibition even; and every now and again one of these firms makes a "splash," as we call it, and tries to do something. This is a very difficult question. I do not want to be unfair to anybody, and certainly I do not want to be unfair to my fellow manufacturers who may not be as successful or as competent as we are; but I would like every manufacturer to have his chance. At the same time, I think if we had a committee composed of business men it would be possible to form some opinion as to the rank and standing of the people proposing to exhibit.

1797. Do you think that the fact of second or third class firms going to an exhibition from which you were absent would affect your business or your trade?—I can tell you what happened in St. Louis. I am not at all sure that I acted wisely with regard to St. Louis. A firm—whose articles were, I considered, very inferior to mine, and ought not to have been exhibited in the same class—did for a time temporarily take away a portion of my trade in America, because they exhibited in St. Louis, and I did not. I got it back again, but probably both that firm and myself lost money in the getting of it back again.

1798. You did get it back by your own methods?—Certainly.

1799. And not by another exhibition?—That is so. Had I been represented there, they probably would never have got it in the first place, and I should still have maintained my price, which is much more important.

1800. That leads me to the question of expense. I suppose, having regard to the benefits of which you have been speaking, you would not refuse to bear the expense occasioned by your being represented at any foreign exhibition?—I never have. I have never looked upon that as a very important matter; and in reply to an earlier question from a member of this Committee—I do not know whether it was the Chairman or some other gentleman—I said that, as far as I was concerned, I had never looked, even, at the question of the payment for space; but I know that in some of the smaller countries of Europe, especially where there are small manufactures, this space question is a determining factor, and so in many cases the Government have taken the space, and the individual exhibitor, who must have been a selected exhibitor in that case, has paid nothing for his space.

1801. May I take it that, so far as you are concerned, the advertisement you get out of an exhibition makes it worth your while to go to the expense of freight and space and of employing an agent?—We have always considered it to be so.

1802. Would your colleagues in the pottery trade generally hold the same view?—Generally they would. I do not mean to speak in any invidious sense, but a large firm conducting their business with liberal ideas, I think, would generally hold that opinion.

1803. I presume you think it very important that Great Britain should be represented abroad by the best firms?—Certainly.

1804. And that we ought not to subsidise the second or third class firms as representatives of British trades?—Quite so.

1805. Coming now to another point, does your experience enable you to say whether certain trades lend themselves much more readily to exhibitions than others do?—Yes, I think that is undoubted. There are many trades, what I should consider bulk trades, that is, trades in which bulk—or, in other words, the amount of output—is the important factor, and in which art of any kind has comparatively little influence. I should say that perhaps those trades are not very much influenced by exhibitions. For exhibition purposes I consider that everybody should try to make a display. I do not want them to make the kind of swaggering display which the German considers it necessary to make, but I do think an exhibitor ought to make a display. He ought to show fine things, and he ought to show things which are not necessarily in the way of trade. I was going to say a moment ago, when you were talking about the benefits that a firm or a country or an industry derives from an exhibition, that one of the benefits I think a firm or a trade derives from an exhibition is the fact that if you are going to have an exhibition, and show against your compeers in Germany and in every other country, it puts you on your mettle, and you probably, for that exhibition, do something new or invent something or try to make something a little better, which is not without its good influence all over the works, I assure you.

1806. But the fact remains that some trades may get very little direct benefit, and perhaps very little indirect benefit, even from exhibitions?—I think that is so.

1807. That would be a point to bear in mind in determining the extent to which the Government should subsidise participation in exhibitions, would it not?—Hardly in determining the extent, I think, to which the Government should subsidise, but certainly in determining the groups of trades or the kind of trades that ought to be approached officially and

Mr. W. Burton.

25 Jan. 1907.

asked to join in a scheme. For instance, as a mere commercial man I was very much struck with the people who had the next show to us in Paris in 1900. They were a firm in the West of England—I think, of Bridgwater, manufacturers of roofing tiles and things of that kind. They had an admirable exhibit for their own purposes, but I could not help thinking that if these people had only known the conditions of trade they would have seen that it was quite impossible for them to do an export trade to Germany or France or Switzerland or Italy, or anywhere off the seaboard of Europe, in goods which are so heavy and so cheap as those. That was a failure on the part of the manufacturer really to consider whether the exhibition would be likely to benefit him. Of course, on the other hand, the firm might have found that so many English went to the Paris Exhibition that it paid them with their English trade; but that I do not know.

1808. There are certain trades which may get very little benefit out of an exhibition?—I think many of the very large trades of this country could hardly hope to get much direct benefit.

1809. Therefore, in speaking of the benefit of exhibitions, you cannot say that the benefits accrue equally to all classes of industry in this country?—Certainly not.

1810. May I ask whether you have formed any opinion as to whether British industry has really been adequately represented at any exhibition of which you have had experience?—I suppose it is almost a matter of common knowledge that British industry, as a whole, has never been adequately represented at any exhibition since the London Exhibition of 1862 or 1861, whichever it was. That was before my time, and I can only go by what I am told about it. I do not think British industry, as a whole, has been adequately represented at any exhibition I have been at.

1811. Perhaps you would say it is not possible to do it, having regard to the complication of modern methods?—I think unless you organise an exhibition in London once again—and about that I see very great difficulty—it is not possible to do it. Our industries are so complicated, they are so varied, and they are in their volume so enormous, that if Great Britain cared to make a real exhibition of what it could do there would be no room for anybody else.

1812. You were speaking about the difficulties that you had in connection with the officials at Paris, and instanced the case of your 8 ft. 6 in. wall; did you ever discover whether your representations on the subject reached the British Commissioner?—I think I remember saying something to Sir Herbert Jekyll about it afterwards. I told him that I was very much annoyed that I should have been treated by his subordinate in the way I was, and told that I should have to take the wall down. I said, "As an Englishman, I resent being told that I have got to do this, that, and the other, when I have already been told how I have got to do it, and I have done it that way." I said, "If I am treated in this way again I shall certainly complain at home, and, moreover, if you had dared to do it I would at any cost have brought an action against you for doing it."

1813. Did you ascertain whether the orders had emanated from Sir Herbert Jekyll?—I do not think they had. I think that, on the whole, the general organisation of the Commission has been inefficient, that the subordinate officials have not known enough for their work, and that they have not treated the British exhibitors with reasonable courtesy. They seem to me to have forgotten that they were the servants of the State.

1814. Have you any reason to suspect venality on their part?—None whatever; quite the contrary.

1815. Did you find that the British officials were always available when you wished to consult them?—No. At the Paris Exhibition of 1900 they were often absent, and on one occasion I was three days and could not find a responsible British official.

1816. With regard to future exhibitions, would it meet your views, as far as you are concerned, if the Government were to provide an efficient organisation, and confine its activity to procuring space, but did not assist financially?—That would not satisfy me. I do not want financial assistance as to the arrangement of my exhibit, but I want somebody to do a great deal more in the direction of organising the general British exhibit than has been done in the past. I do not know how that body is to be constituted. That is a question for very grave consideration. Whether it should be an official body or not I do not know, but an official body might be the very best for the purpose, because it would be free from any question of jealousy or of appearing to favour any particular trade or section of a trade. What I do most emphatically feel myself is that, first of all, we want a body which shall organise the decorative arts or applied arts of Great Britain, shall house them suitably, arrange them suitably, and shall compel, if necessary, their adequate arrangement. Of course, there will not be much compulsion required. It is competent advice really that is needed as to how a manufacturer can best display his goods in harmony with the needs of the rest of the section. I want our section to be treated as a whole; I do not want it to be a higgledy-piggledy arrangement.

1817. (*Mr. Wilson Fox.*) An expert in the trade would have to assist in the arrangement, would he not?—I have suggested earlier, in replying to some other question, that I thought this would best be managed by a standing committee (which might be selected by the various Chambers of Commerce or might be selected by the Board of Trade, or might be selected in a dozen different ways), consisting of manufacturers primarily, with perhaps a chairman who was an independent official chairman—a chairman appointed by the Board of Trade, if you like—who might have under him two or three clerks only.

1818. (*Mr. Malcolm Ramsay.*) I suppose you would find it impossible to suggest any figure as the amount of the grant that should be made for the various classes of exhibitions?—I think that is a question which must be treated absolutely on the merits of each case. For instance, if it were proposed to hold an exhibition, say, at Stockholm, I do not think that Sweden offers a very favourable field nowadays for English manufactures of my kind. They have very good manufactures of their own, and, moreover, they are very well represented. I know that Mr. Robert Almstrom (who is the head of the porcelain works there, and who is a Swedish senator) said to my friend Mr. Grindley, the potter, "Oh, I see you are breaking into my market; I will have the duties put up." If it were proposed to hold an exhibition in Stockholm, so far as our trade is concerned, I think English manufacturers would be wise to stay away, unless they produce something which is not made in Sweden at all—something of a certain class or of a certain artistic value which might tempt people entirely apart from the question of price.

1819. Do you think that British trade, or your trade in particular, got much benefit out of the £100,000 that was spent at St. Louis? Was the direct commercial advantage at all in proportion to the size of the grant?—That is a very difficult question to answer, because whatever may have been the tendency of business in our particular trade since that time, it is difficult for me to separate the influence of the St. Louis Exhibition from all the commercial work that has taken place since, and from what is going on in commercial pottery circles in America. The men who are most concerned in the American trade—I mean in the big bulk American trade—the men who supply the hotel pottery from Boston to San Francisco, and from New Orleans up to Toronto, supply all the hotels, railway companies, and everything else, and their trade this last year has been the biggest trade they have ever done in the States. But how much of that is due to the St. Louis Exhibition, and how much of it is due to the fact that the American manufacturers, thinking they were quite safe behind their 60 per cent. duty, began to make worse stuff—stuff that crazed and did not wear, and all that sort of thing, which undoubtedly happened—and how much of it is due to the commercial energy of these men who work the States particularly for all they are worth, I do not know. It is impossible between those three factors to say this belongs to the exhibition or this belongs to the other thing. But the general fact remains that in bulk we are doing more trade with the United States of America to-day than ever we were in our particular line of business, and that is not confined to the cheap goods only. A leading English firm, for instance, I know, do not know, and have not known for the last two years, how to turn out enough of their expensive things for America; and that absolutely depends on their reputation and on the quality of their goods. If they lost that reputation they would lose it all. A few years ago the goods of Haviland, at Limoges, made rather a serious inroad into English

porcelain in the States. It was all round. Haviland had something fresh to offer. The Englishmen had rather gone on doing the same old thing for 20 years, and Haviland did a new thing, and for a time Haviland swept the board. In June last a man from the States was in my place, and I said, "I suppose you are going to Limoges?" "No," he said, "I am not going to Limoges. There is nothing there to see any more. I can buy all I want in the Staffordshire potteries and in Copenhagen." He does not go to Dresden any more, he does not go to Berlin any more, and he does not go to France any more. He buys all he wants in the Staffordshire potteries and in Copenhagen. But I know that his people some years ago did a tremendous trade with Havilands.

1820. Then you think the St. Louis Exhibition counted for something?—It undoubtedly counted for something. I have no doubt whatever about it.

1821. (*Mr. Harris.*) Did I rightly understand you to suggest just now that your own firm's eminent position commenced about 1900?—You say "our firm." Our present site was a field in 1892. Up to that time I had been chemist to the Wedgwood firm. Then my particular branch of the Pilkington family, who are great colliery-owners in our district of Manchester, approached me on a question of technical interest connected with brick-making. I said, "You could do something better than brick-making out of this, and you had better start on making something else." "What could we make?" "You could make excellent tiles out of this; it is splendid stuff." We started business, and I built the works. In 1892 we were not born, and it is only fair to state that 1900 would be the first time when we were really ready to show at an exhibition.

1822. My point is this: Do you, or do you not, date your success from the Paris Exhibition itself, owing to your exhibit there?—We do not date our success, in any way, from that; but certainly the Paris Exhibition gave us a reputation, as a firm, all over Europe that we would not have got in any other way in the same time.

1823. Then, in spite of all the disadvantages, it was a great gain to you?—Certainly; it made us known all over Europe.

1824. You said that you did not go to St. Louis as an individual firm, partly because, though you had business in other places in the United States, you knew there was no business to be got there?—Yes; we had tried St. Louis before, and all that district.

1825. Why could you not push your trade there—*i.e.*, as a new area?—St. Louis is very far inland. It is rather a curious situation. The American tile works are all either in New Jersey or in Ohio, and there are certain towns in America where, even on the cheapest tiles, we have just the advantage.

1826. To come to another point, namely, your suggested committee, consisting of business men, to supervise the arrangements leading up to exhibitions, do you think there would be any danger of the big firms, who would mainly be represented on that committee, crushing out the smaller men who are anxious to exhibit?—I think possibly there is a danger of that taking place. That is one reason—it is only one reason, but it is an important reason—why I should suggest that there should be an independent official chairman of this body, who would be open of access to everybody, and to whom the small manufacturer, if he found any injustice was being done to him, could appeal at once, and be perfectly sure that his appeal would be heard and understood. If, for instance, we had somebody like Sir Alfred Bateman in the position of an independent chairman, that would be an admirable arrangement. I do not suppose Sir Alfred Bateman would take it, but still I cannot think of a better man for the position. I am quite sure that everybody in the Potteries would feel, if Sir Alfred Bateman were in that position, "I can go to him, and he will not allow injustice to be done if I can prove that it is being done."

1827. Taking your statement that better arrangements were made for getting manufacturers to exhibit at Glasgow than were made at Milan, is not the real point there that the conditions at Glasgow were quite different from those at Milan?—That is a point, certainly, and I am very glad that you have raised that point. Naturally, of course, a market like Glasgow, which is a home market, and a very important market in our section of the trade, appealed to everybody. That was only common sense. But the manufacturer might very well say, "I do not do any trade in Milan, and it is no use sending tiles or pottery to it, because the Ginori factory or somebody else can make these things just as well as we can, and we shall have no chance at all." But that was not the only factor. I said very carefully that at Glasgow they had a man like Sir James Fleming, a well-known Glasgow citizen, and a very well-known pottery manufacturer—he is very well known personally to most of the Staffordshire men. Sir James Fleming was on their committee, and he wrote round to all the men he knew, and he said, "Look here, I think you ought to come and support us." It is that sort of personal influence that is wanted. If you can get the right men on this committee, that is the kind of personal influence that they can exercise, but it cannot be exercised in any other way that I can think of. I am quite sure that if someone of some standing in our trade, as Sir James Fleming is, or the late Sir Henry Doulton was, or some other men I could name, had had the organisation of an adequate representation of English pottery at Milan put into their hands, they would have secured easily an exhibit which I do not think you could have got in any other way.

1828. (*Sir Swire Smith.*) Do you think the time has come when there ought to be a great international exhibition held in England?—I have thought so for some time; but you see the factors which go to make up the success of an international exhibition from the commercial point of view are so varied that I am almost forced to the conclusion that the only place which ought to have an international exhibition any more is Paris.

1829. If we are not to expect that we are to have a large international exhibition here, what is the good of this permanent department that you speak of?—I would not confine this department to international exhibitions. There may be exhibitions of British manufactures as there were at Glasgow and Wolverhampton, for instance. They called themselves international exhibitions, but to a large extent they were national exhibitions. It is quite true the French had a small section, and the Danes had a small section, and so on; but the bulk of the exhibition in Glasgow, which was a very good exhibition indeed, was a national exhibition—it was representative of England, Scotland, and Ireland. That kind of exhibition, I think, might be of very great service in our own country. For instance, there is to be an exhibition at Dublin, and I have arranged to show there, and I shall show all I can there.

1830. Would you consider that in the case of one of these smaller exhibitions the Government should practically run it?—No, I do not want the Government to run it. I am against the Government running it.

1831. But you would expect the Government to be at the head of the great international exhibitions?—I should expect the Government to do the kind of organising which no individual firm can possibly do. I should expect them to advise rather than do anything else.

1832. And not to aid financially?—Not in our own exhibitions, because there does not seem to be much need for it. For instance, you could, with Government assistance, get an exhibition of British manufactures of certain kinds in London here, and that, I think, is an exhibition which the Government might very wisely aid.

1833. Would you consider that, even for the possibility of international exhibitions being held, it would be worth while that we should have a permanent department who could rally these other committees round it?—I think so; I think there ought to be something. I do not care how small and how simple it is; I would have it as small and as simple as possible, but I would have something in the shape of a bureau, if you like, where everything could be filed and pigeon-holed, and where every information about exhibitions and the conduct and organisation of exhibitions could be kept for reference and could be used. It might be the smallest department possible.

1834. From your point of view, the object of an exhibition would be to show the best of every industry?—I think so.

1835. And in order to get at the best, you would favour collective displays generally, would you not?—I am afraid I cannot give a general answer to that question.

Mr. W. Burton. 25 Jan. 1907.

1836. With regard to your own industry, you are not so particularly favourable to a collective display, I gather?—No, and I think with regard to most of the other industries there might be some difficulty. Take, for instance, the wallpaper industry. You have now got a wallpaper syndicate, which is all right; but suppose the wallpaper syndicate said to you, "Very well, of course we are the people; we do the trade; we will arrange this exhibition for you," then I would say, "Yes, but what about Jeffrey and Co., and what about John Lines and Co, or other independent firms?" They would say, "Well, of course we have nothing to do with them." No, but then Jeffrey and Co. make the most artistic wallpapers that are made in England in our own time.

1837. Would you not say that the only means whereby you could be sure of having the best of an industry would be to have this committee, who should select the exhibits?—I think so.

1838. Then it is not a question so much of selecting firms as of selecting objects, or selecting products?—I would like to say myself that, although as an Englishman I am rather an independent man, and I like to go my own way, at the same time I have seen so much benefit derived from the way in which foreign nations have to a certain extent subordinated their individual interests to the general good, that I am anxious to see some scheme tried whereby the thing should go as a whole, and in which every manufacturer, whoever he was, should more or less consider his neighbour as well as himself.

1839. That would mean a collective display, would it not?—I do not see why it should at all. I have never seen a collective display of German pottery, and I have never seen a collective display of Hungarian pottery. At the Hungarian Exhibition Zsolnay had his show, and Arendts had their little show, and somebody else had their little show. They were each fitted into a general scheme, and there was no interference with their individuality; so that I cannot call it a collective exhibit.

1840. Then generally, of course, you would favour that there should be some choice by this representative committee?—Undoubtedly.

1841. So as to secure that a particular industry was shown at its best?—Yes, certainly.

1842. Yet you would allow individual displays also?—I think the best result would be got by individual displays. May I give another illustration? This is a very important point, and one about which one does not want to be dogmatic. For instance, the great firm of Villeroy and Boch, who have seven or eight factories all over the German Empire, and are the largest potters in the world at the present time; manufacturing pottery of every kind, beginning from the commonest and cheapest floor tiles, or wall tiles, which are sold by the thousand and sent away in truck loads, up to earthenware and porcelain, and everything of that kind. Villeroy and Boch had an exhibition of what I may call their ordinary pottery as a part of one of the sections of the German show. But Villeroy and Boch were also authorised, owing to their reputation and position, by the German Commissioners to decorate all the columns that supported the roof with their mosaics. They also arranged the big mosaic sign that went over the German arch.

1843. (*Mr. Malcolm Ramsay.*) Was this the Paris Exhibition of 1900?—Yes. Another time, in addition to having a little show of fire-places and things like that, they were asked to supply the fire-places that were actually built in the section of the German officials. Another firm had been allowed to exhibit a bathroom there, and as a matter of fact, they tiled that bathroom with tiles that had been bought from us; which I thought was the smartest thing I had ever seen in my life. We had made the tiles for a Berlin architect; we did not know who they were for or what they were for, but we found them there.

1844. (*Sir Swire Smith.*) You think the effect of these exhibitions is really beneficial?—I think that in certain trades it is beneficial undoubtedly.

1845. And you would consider that the holding of an international exhibition in England would be beneficial for us, as well as for the foreign visitors who might see it?—Yes, I do think so—that is, of course, if you can hold it on an adequate scale; but a small international exhibition in London I do not think would do any good at all. If you propose to hold an exhibition in London on a really adequate scale, I am frankly puzzled where you are going to hold it—I mean where you would get any site central enough.

1846. Would you consider, speaking generally, that it would really be a great benefit to the nation as a means of giving information?—I think it would be a benefit to the nation.

1847. What is your view with regard to the effect upon manufacturers in keeping them alert?—Again, I keep to my own industry. There is a little hand-book published for private circulation, by the late Mr. R. W. Binns, of the Worcester Royal Porcelain Works, a copy of which he presented to me before he died. This was a record of the progress of the Worcester Works in the fifty years from 1850 to 1900 practically, though it might have been from 1845 to 1895—I do not remember. I have often looked at this book to see what it was all about—I mean what Mr. Binns really had learnt. I think he had not learnt his lesson properly, if I may say so with all deference to such a gentleman. He was a very able man in his way, but what he did not apparently see was the real meaning of the years when they were exhibiting—London in 1851 and 1862, and Paris in 1867, Vienna, Philadelphia, and so on. He gives a chapter to each of those exhibitions, and he shows the efforts that were made at Worcester to have a fresh style at each exhibition, to have something better, to do better things than they had done before, or than any of their Continental rivals were doing. At the last four or five exhibitions the Worcester Porcelain Company have not exhibited, and we hear of no new Worcester style of ware.

1848. Reasoning from the example of Worcester, would you say that indicates the influence which exhibitions have exerted upon all firms that are in the habit of exhibiting?—I think so.

1849. It really spurs them on to new things?—I think it does spur them on to new things.

1850. Would you say that just as it is good for the public to see, and good for the manufacturer to make, so has it the same influence upon the workman in keeping up his pride in his work?—Undoubtedly. In our trade every firm that has made a good exhibit, either at Paris or at London or anywhere else, has always taken good care to take over the workmen who have been mostly concerned, to see their own work, and to compare it with what has been done elsewhere. I know Wedgwood's, Minton's, Doulton's, and the Worcester people have over and over again sent twenty or thirty of their principal workmen and artists at a time to these exhibitions to see their own goods and those of other nations. We did the same at Paris in 1900; we sent twenty of our people there.

1851. Would not the argument with regard to Stockholm apply to all exhibitions? You said that a maker there said, "If you send, we shall put up the duties." Would not the makers of any goods say that, and would they not use all their influence to keep you out of their particular country, and would that not be a reason why you should not exhibit?—No, it would not be a reason why one should not exhibit. Of course one must always look upon the volume of trade that is possible in a country. Sweden, for instance, is not a wealthy country. It is a comfortable country; but the number of wealthy people in Sweden is relatively small. It is largely an agricultural and pastoral country, where the wants of the people are few and comparatively simple. The things we want to export are not the kind of things that would be bought in Stockholm in any large quantity. That is really why, I think, if we were asked to go to Stockholm there might be some reason why we should not, unless we made something here that they cannot make; but if they can make what we are making, then why should we go?

1852. Do you think that our British industry, your own trade in particular, has learnt much from visiting foreign exhibitions?—Yes, I think it has.

1853. Therefore the continuing of these exhibitions would probably tend as much to our benefit as to the benefit of anybody else?—I think now it would probably tend more to our benefit than to the benefit of some other peoples because we have allowed other peoples to do certain things in regard to pottery, while we have been content to go on marking time. So now I think, we might get some of the benefit that in the past these nations had from us.

1854. (*Sir Isidore Spielmann.*) Have you any experience of any of your exhibits being copied? In other words, have others reproduced your designs?—No. I

have had no experience of that kind. May I tell you something that I learnt when I was at Wedgwood's as to the copying of designs, although it is altogether apart from exhibitions? A well-known Dutch manufacturer visited Wedgwood's works, and as his firm was an old firm, just as Wedgwood's was an old firm, Mr. Godfrey Wedgwood, the then head of the firm, who was a most admirable specimen of the cultivated English gentleman, treated this man very nicely indeed, and took him round the works. and showed him practically everything. He said, "I suppose we both make these things, and you know all about it," and so on. Mr. Wedgwood told me this himself. But he said, "You know I was horrified about six months afterwards to discover that these very people were selling in London absolute imitations of our ware. I wrote him about it, and he said, 'Oh! certainly, wherever he went he always kept his eyes open, and as there was no international copyright he did not see why he should not do so.'" For myself, I have never suffered at exhibitions from that. Nowadays, the means of communication and of general travelling about are so different from what they used to be, that you do not need to wait for an exhibition to know what your trade rivals are doing all over the world. I know perfectly well what they are doing, and I expect them to know equally well what I am doing.

1855. (*Mr. Wilson Fox.*) When you said that you had learnt something from other people by showing at exhibitions, did you mean that you had learnt something by which thereafter you could improve your own methods?—Yes, I certainly meant it in that sense.

1856. May I understand generally from your evidence that a firm which has something new to show, or something better than other people to show, gains by sending an exhibit abroad?—I think so, absolutely. If I may supplement that, I think there are two classes of firms who gain by exhibiting abroad. First of all, there is the firm which has got something absolutely fresh to show, or which has never shown at all before, which very likely has no trade in that particular country, and wants to get some. I think they gain, first of all. Then there are the other firms who have already established a considerable foreign trade in that particular country, and are anxious to retain it.

1857. Also showing at a foreign exhibition would give a manufacturer here, who has not made a reputation, a chance of making a reputation?—It gives him a certain *cachet* certainly, both at home and abroad.

1858. You have been at several exhibitions, have you not?—Yes.

1859. As regards the future, can you give us any idea as to what class of foreign exhibition the British Government should support? You see there are a great many cropping up nowadays, and there are large ones and small ones?—Certainly.

1860. Could you give us the benefit of your ideas upon that point?—I think that if the matter were looked at in a right light the British Government might reasonably and properly give support to every class of exhibition in measure. For instance, a few years ago there was held in Turin an exhibition of decorative art. I am not quite sure about this—Sir Isidore Spielmann will know—but I know Mr. Walter Crane had a great deal to do with it, at all events, and I think he organised the British section. I know some of our things were shown there—some things which Crane and Lewis Day and Voysey had designed for us. I know that was the means of influencing Northern Italy with regard to English goods, because in certain lines it turned the attention of the Italian architects and others to English tiles, English wallpapers, and English textiles. I happen to know firms in each of those lines which have directly benefited from that exhibition, although it was only a very small thing, and a very special thing, and a sort of thing with which the Government, as a Government, had nothing whatever to do. I mention that as a case where had it been necessary—it was not necessary, because I think the Italian Government defrayed the whole cost of this particular exhibition—a few hundred pounds spent by the Treasury in supporting such an enterprise would, I think, have been money well spent.

1861. That was an exhibition which only consisted of the exhibits of a few trades?—There were very few trades exhibiting there.

1862. Would you make any distinction between the exhibitions which are supported by foreign Governments and those which are not supported by foreign Governments?—I do not think I should, provided always, of course, that whoever was responsible for this spending of the nations's money, and this expenditure of the nation's energy and time was convinced that the thing was worth it. There might be exhibitions organised, for instance, which from a commercial point of view would be of very little value to most trades. But then, I think, if we had any body of men who were considering this question they would say at once, "This does not seem to us, as business men"—of course, I agree they may make mistakes; we all can make mistakes—"that it is an exhibition that is going to be good enough for it to be of any value to any of our trades."

1863. With a better organisation, if I understand your view, more traders and manufacturers could be induced to show?—Certainly.

1864. But if the Government took part in almost every exhibition of any sort that came into existence on the Continent, would not our people get rather tired of being continually asked to show, and would not they be rather surfeited by exhibitions?—If you always went to the same people, probably; but I take it that you need not always go to the same people. For instance, in some countries it might not pay manufacturers in any given trade. Take the pottery trade. If you were having an exhibition, we will say, in Siam, there is a man in the Potteries who is already doing a trade in English earthenware in Siam and Southern China through Siam. Naturally it would help him if you had a show at Bangkok, and he would like to go and show there; but if you asked me to send to Bangkok I should say, "No, thank you." You see the conditions are different.

1865. Then in that case it would be very difficult to get a representative exhibit of pottery?—Why?

1866. Because, for instance, supposing you and Minton's and Doulton's took that view, we should only get this one gentleman at Bangkok?—I am citing Bangkok as an extreme illustration of one side of the question; but yet, I think, it might be good for the trade of the country that even the man who is making the stuff that is sold in the market at Bangkok, say a remote place from the centre, should be helped. If you came nearer home, if you came to one of the European cities, then I think you would get a much more representative show all round.

1867. Is it your view that there ought to be practically no limitation to the number of exhibitions which the Government should support?—I think it would be very difficult to lay down any hard-and-fast rule, and I think that probably, in practice, it would be found that there ought to be limitations; but I think those could only be considered as they arose.

1868. I just want to put this to you: Some of these smaller exhibitions are probably promoted by people who have got axes to grind?—Yes, that may be so.

1869. It may be done to benefit the hotelkeepers in a particular district, say?—Certainly.

1870. Or to benefit the railways, and so forth?—Certainly.

1871. If it were found that certain small exhibitions were promoted rather with those ulterior objects, do you not think that the Government of Great Britain should be careful to examine the particular reasons for which an exhibition was promoted?—If there was such a bureau or organisation or office as I have suggested, surely part of its duty would be to accumulate information which at present seems to be plentifully lacking? As to the exact result, either to trades or to individual firms exhibiting, after an exhibition of this kind, if you had a body such as I have suggested, surely one of its duties would be to address a series of questions to manufacturers, "Were you satisfied with the results?" and so on, and asking them to give a few simple reasons for their answers. In that way you would tabulate a mass of information that would be invaluable in the future.

SEVENTH DAY.

Friday, 1st February 1907.

PRESENT:

Sir Alfred E. Bateman, K.C.M.G. (*Chairman*).
The Rt. Hon. Sir James Kitson, Bart., M.P.
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G.
Mr. Algernon Law.
Mr. Malcolm Ramsay, C.B.
Sir Swire Smith.
Sir Isidore Spielmann.
Mr. S. J. Waring.
Mr. U. F. Wintour (*Secretary*).

Mr. Walter Francis Reid called, and examined.

Mr. W. F. Reid. 1 Feb. 1907.

1872. (*Chairman.*) Can you tell us what your experience has been in connection with exhibitions?—I have visited most of the large international exhibitions, I think, that have been held in this country and in others, with the exception of Chicago; I did not go to Chicago.

1873. You have been juror at several exhibitions, have you not?—Yes, I have been juror at a number of different exhibitions and shows, and I generally judge for the Royal Agricultural Society in this country.

1874. On what particular branches have you been judge?—At the St. Louis Exhibition I was vice-chairman of the Liberal Arts Department Jury. The Group Jury that I went out on was chemical and pharmaceutical.

1875. Are you a chemical expert?—Yes, I am a technical expert. I was vice-chairman of the jury for the manufacture of paper—that was a speciality of mine—and I was also vice-chairman of the Department Jury for Horticulture. I am a gold medallist of the Royal Horticultural Society, and so I had some qualifications for that, and, being there, they made me work. Then I was also a member of the Group Jury for Aerial Navigation at St. Louis, and am honorary expert to the Aero Club of the United Kingdom; so I have some qualifications for that also.

1876. Indeed, you had very wide qualifications?—I have been at it for a good many years, and I have been active all the time. I was a member of the Sectional and Group Juries at the Milan Exhibition, and I have been a Governor of the National Physical Laboratory.

1877. I think you have told us quite enough of your qualifications for speaking to us on international exhibitions. Have you formed any opinion as to the effect of exhibitions on the manufacturing and exporting trades of this country?—I think, on the whole, they encourage trade, and must encourage it.

1878. What has the effect been on British arts?—I think in British arts that we have decidedly learnt a great deal from our foreign, I will not say competitors, but colleagues, and that we have profited in every way by exhibitions as regards arts generally. When I come to remember the first exhibitions to which I went, and compare them with the exhibitions that are held now in this country and elsewhere, I can hardly fail to see that enormous progress has taken place within those years.

1879. Have you anything to say to us as regards the general commercial relations between the countries concerned?—There has been such a very great improvement in the commercial relations and in the personal relations between the different nations within my recollection, that it is rather difficult to earmark, as it were, what part is due to the exhibitions themselves. Having been at many of them, I know that those who attend such exhibitions make many friends and establish many business connections. There can be no doubt that from that point of view a large number of the first people connected with arts and industries meet each other in the same way as at international congresses, of which I have attended a good many also. I think it promotes the intercourse and the trade of nations.

1880. Is that because of the personal element?—I think if persons meet and are friendly with each other the business comes of itself.

1881. As regards the industries and the exhibits, what are the particular industries or classes of industry which have chiefly benefited, in your opinion? Would you say chemicals, or china, or iron and steel, or what?—I really think it is extremely difficult to say how far any industry has benefited from exhibitions alone, because we have the interfering action of the tariff in each particular country. If you hold an exhibition, for instance, in France, you will have different conditions to those which you will meet at an exhibition held in the United States. It is quite impossible to say how much of the trade is due to the exhibition in a case like that. There must be an interference caused by the tariffs, but one really cannot say how much that is.

1882. You do not know the particular industries that have been specially affected by exhibitions, do you? It has not come in your way so much as their general aspect?—The individual cases have not so much come before me; but I do know of manufacturers who have been very pleased indeed with the result.

1883. Taking the *per contra*, do you know of any industry that has been adversedly affected?—I have heard—of course, on juries one does hear these things—that that is chiefly where designs have been copied, and where ideas have been taken with regard to machines and a few articles of commerce. I have heard complaints about that. But one has to put against that, of course, what our manufacturers learn from their competitors, which I believe is very much greater than what they lose.

1884-5. On the whole, would you consider the influence has been very beneficial?—I think, on the whole, I may say decidedly that it has been beneficial.

1886. Do you consider that these results warrant the official participation of this country in international exhibitions in future? That is, participation by the Government giving grants?—I do not know whether the question refers to exhibitions held in this country or to exhibitions abroad; I am not quite clear on that.

1887. I am referring mainly to exhibitions abroad?—In connection with exhibitions held in a foreign country by foreign nations, I think myself that the expenditure is warranted; but I do not think the justification is so great in the case of exhibitions held in this country.

1888. There has been a very large expenditure in Paris and in America by the British Government?—Yes; there was a very large expenditure there.

1889. Do you think the direct commercial results warranted that expenditure?—There are two points with regard to the results which should be kept separate: one is our prestige as a nation, and the other is the commercial benefits which accrue to our manufacturers. For instance, if you take the finest exhibit that we had at St. Louis, for which Sir Isidore

Spielmann was mainly responsible, the very fine art exhibit which we had there, we could not say that pecuniary benefit accrued to Great Britain from that; at least, personally I do not think so. On the other hand, it was a very great advantage for Great Britain to be represented in that way, and it gave her a position among the nations which perhaps no amount of merchandise could have given.

1890. Do you think that we should have had as good results by private enterprise if the Government had not taken part?—I think it would have been quite impossible. I do not see how any individual, or group of individuals, could represent the whole nation. It is the Government itself that represents the nation.

1891. In art, do you mean?—I mean in anything.

1892. But it is the private individual who supplies the exhibits?—It is a number of individuals. I do not think you could find any group of individuals who would come together and supply exhibits representing the whole country.

1893. Not unless you mean, I suppose, there was Government supervision and help?—Not unless the Government take the lead. There would be private jealousies, and, of course, there would be financial difficulties as well. In any case there would be the private jealousies between individual manufacturers, so that even a single trade could not be well represented unless there were some neutral head.

1894. Assuming for the moment that public money is granted to organise official exhibits, do you consider there are any special conditions that should be insisted on about the accommodation and other facilities offered by the exhibition authorities?—That is a question that I do not quite understand. The point that is not quite clear to me is whether we are in a position to get any conditions altered that might be stipulated by the originators of the exhibition.

1895. Take the case of an exhibition at Paris; the stipulation might be made, might it not, by the Government that we must have so much space before we will take part in it—that it must be a proper amount of space, and in a good situation?—It that case it would be a matter of negotiation between the promoters of the exhibition and our Government. Of course, we must stipulate that there shall be sufficient space for our country to be adequately represented. I think that would be necessary.

1896. Would you also make it a condition that a large number of exhibits should be offered by British firms?—I do not think we can do that. Take, for instance, the St. Louis Exhibition. We were nearly two years making up our minds whether we should join or not. I do not think you can stipulate that our manufacturers shall send so many exhibits in before you can give your assent; I do not think it can be done practically.

1897. Do you think you cannot get them to promise even to send?—I am afraid not. I am afraid the time that would elapse in getting promises would be so great that we should be coming in at the end of the negotiations. I do not think that would be feasible. I think the best way would be to devote a certain sum of money if the nation thought fit to be represented, and then to get as many as you can to enter.

1898. You have not had much to do with the organisation of exhibits, have you? You have had more to do with the jury work, I think?—Yes; my work has been chiefly in connection with the juries, but as a member of the public I have observed what is to be seen. Then I got quite a number of exhibits for St. Louis.

1899. Did you help to get people to exhibit, do you mean?—Yes. There was some difficulty at first. It was chiefly in connection with the Society of Chemical Industry. We all did our best there, and Sir Boverton Redwood especially was very active. Indeed, we all did what we could to get our friends to come. They would not come at first, because they said it would not pay them the cost of going to America, but all of us used our personal influence, and I think at last we got what was the second-best British exhibit there.

1900. Have you happened in your experience to come across the different methods in which other countries or people exhibit—Germany, for instance, or France?—Undoubtedly I know something about Germany. I was at a German University, and I know a great deal of their methods. There is a great deal of personal pressure put upon exhibitors there.

1901. By the Government?—Undoubtedly. I think any firm that supplies the Government in any way is bound to exhibit. It is considered a matter of honour with them, and they do it invariably. If the word goes out that there is to be an exhibition, and that they should exhibit, they do it. There is a great deal more moral persuasion in that way than there is here.

Mr. W. F. Reid.
1 Feb. 1907

1902. But you have not been concerned, I take it, in the exact process in which it has been done in Germany within the last few years?—Not personally, because I am a British subject, but I have had conversation with men of these other nations—Germany and France.

1903. Have you had to do with the French system?—Yes. The German organisation is facilitated very much by the guilds that they have. All their trades and industries are organised in guilds. They were started first in connection with the employers' liability to workmen. It is different there to what it is here; there the State pays part, the guild pays part, and the workmen themselves have to contribute; and so they classify the trades and make them form guilds, each separate trade forming a separate guild. These guilds are at the disposal of the Government, and when anything like an exhibition takes place the Government gets these guilds to help them to nominate men who will assist. They have no less than 8,000 of these guilds. I have taken that number from their official return.

1904. They would include most of the manufacturers, I take it?—It is very difficult to find one who is not in the guild. There they have a network which is spread over the whole industrial country, and they can set that to work whenever they like.

1905. That would be a very convenient machinery for the purpose?—Yes. It is all to hand, and is altogether apart from their regular organisations, their permanent organisation for exhibitions. In France there is a committee called the Société Française des Expositions à l'Etranger; I do not know whether you have had particulars of that?

1906. Yes, we have. I want to know your opinion about such systems as the German system and the French system compared with ours, and whether you think we can improve our methods?—I am rather in doubt whether we have got any methods. I think it is done in a haphazard way here. I do not think we have any method, at any rate, I have failed to discover any, so far.

1907. What method would you suggest?—That is a very big question. I read a paper before the Society of Arts some two years ago, and I made a suggestion there that there should be a joint committee.

1908. Will you let us have the benefit of that suggestion; what joint committee—formed of whom?—First of all the Technical Societies, the Industrial Societies, and the Commercial Societies should be represented, and if they are represented, then, of course, you have all their members with you. As the matter is now a Royal Commission is named, and that Royal Commission, I believe, names committees. I think that is beginning at the wrong end, because you cannot tell that you have hit upon just the very men who will secure support. You will of course hit upon influential men, and men who have perhaps a high political position, but you will not get the same support from the masses and from the people who will actually have to supply the exhibits as if you were to go to them in the first place, and say, "Now, send us men that will help us," and they sent them. Then you would have the whole of it to your hand. That worked out very well with the National Physical Laboratory. They had a joint committee there, of which I was a member, and the board of governors was composed of representatives of the different societies that took an interest in the work of the National Physical Laboratory. It did very good work indeed. We got suggestions and pecuniary help from all over the country; before the Government granted sufficient funds our societies subscribed, and we found money to assist an undertaking which the Government ought to have started in the first place on a proper foundation. But we did it because each representative went to his society and said, "We are so much short of funds; this laboratory is doing good work, and we ought to subscribe to it"—and they did.

1909. Do you think that these societies you mention would subscribe to such an organisation?—I do not know whether they would be able to subscribe or

Mr. W. F. Reid.

1 Feb. 1907.

whether it would be within their legal rights to do so; but in any case you would get their personal help, and I think you would get the whole nation with you in that way. It is the old point of representation and taxation, we may say; you may go to them, but they will not help you unless they are represented.

1910. Would you propose a permanent committee?—I think that is the only way to do it satisfactorily.

1911. How would you get hold of the manufacturers who are outside, because a great many of them are, I take it, outside these societies?—I think most of them belong to some society or other. I do not know of any that would not belong to some body. I think all of them belong to some commercial or technical body.

1912. Those bodies would include the chambers of commerce, I suppose?—Certainly. I may say, perhaps, with regard to the benefit that is to be derived from exhibitions, that I think commercial men do not derive so much benefit as technical men. It is the people who make the goods that derive most benefit from exhibitions. The merchant will buy goods from wherever he can get them—foreign goods in preference, if they are cheaper. It is the manufacturers who live in this country who would benefit most by exhibitions, and I think they ought to be very strongly represented. The merchant will go here, there, and everywhere; he will go and see the goods, and he will buy the goods of the nation where he sees them; but it is the technical men, the actual manufacturers of the goods, who, I think, should be most strongly represented. That is the opinion I have formed by observing the course of things at exhibitions.

1913. And it is your opinion that we want to get. What official limits would you introduce into such bodies?—I think each department of State should be represented, and, of course, they should have control over the executive, as it were. I do not see how it can be otherwise if the State is to find the money.

1914. If the State finds the money, that would naturally be so?—Yes, but the others would have a consultative position, and would be consulted; so that the resolution of such a body would be practically a resolution not only of the Government for the time being of the country, but also of the bulk of those who would have to assist in getting exhibits.

1915. How would you proceed? Supposing an exhibition was going to be held at some country abroad, would this committee meet and consider whether it is worth being represented at it?—I think that would be the way. This permanent committee would meet, it would be consulted by the Government, of course, and then I think they would be able to say, with their knowledge of every different organisation, whether such an exhibition could be useful to us or not. I think I have made the suggestion in my Notes, or, if not, I make it now, that I do not think a general international exhibition now is of so much use as specialised exhibitions.

1916. I was just going to ask you that question. What have you to say about the departments of the State which should be represented?—With regard to the different heads of the departments of the State being represented, I think I could give you one or two instances, if I may, to show the necessity of it. When we were judging at the St. Louis Exhibition, we noticed many things. We were familiar with the trades in which we were judging, and we could see some openings for trade and for British commerce; but it was not one of our duties to report upon that so much as on the goods that we saw there. After we had finished our duty in judging, we received a letter from the Board of Trade through the Commission, would we report upon the commercial aspects that we had noticed at the Exhibition? It came too late. We had finished our duties, we had left the Exhibition, and we could not then report as we might have done if we had been on the spot and could have made inquiries. At the next exhibition, at Milan, the Board of Trade said nothing about it—in fact, nobody said anything at all. It was one of the jurymen who called attention to the fact that perhaps British commerce might gain some benefit from the remarks of the jurymen; and so, finally, a letter was sent out to the jurymen asking them to report on the commercial aspects of the exhibition.

1917. What exhibition was that that you are speaking of?—The Milan Exhibition of last year. One would have thought, after what had happened in the first instance at St. Louis, that that would have been made a note of; but, as a matter of fact, there is no continuous management at all, and in such things as that it seems to me to be of the utmost importance that openings for commerce should be noted by the jury, who are all experts in the different trades. But, as I say, nothing was done, and nothing would have been done if it had not been for the casual action of a juryman.

1918. Your work was simply examining the exhibits with a view of getting prizes for the best goods, I take it?—That was so. There was nobody, practically, who could give any information about commerce except the jury. There was another case that I met with at Milan. In my particular department there was a very interesting exhibit showing the teaching of agriculture to the Italian soldiers—all the Italian soldiers practically, I may say, being taught agriculture.

1919. They help to get in the harvest, do they not?—They do anything in connection with the tilling of the land. They are taught agriculture at a number of stations. I found that this did not seem to be known here, and I made personal inquiries, and wrote to the War Office about it. They asked me for further particulars, and I sent them a full account of the whole thing, for which they expressed their gratitude, and said it would be very useful. That was a casual thing, but if there had been a representative of the War Office on the Committee, or the Royal Commission, or whatever you may call it, that could not have happened merely casually, because he would have been alive to anything of the kind. Then, again, with regard to the new things that appear, which may be of the utmost importance nationally. For instance, now there is a new process for fixing the nitrogen of the atmosphere, upon which the whole of our national defence depends. We are now getting the essential material for our propelling agencies, our gunpowders, all from Chili; but the moment they are able to produce nitric acid from the atmosphere more cheaply, it will all come from Germany or Italy or Norway; so that the whole of our munitions of war will depend upon the supply from those countries.

1920. (*Sir James Kitson.*) Why should it not come from Scotland, where there is abundant water power?—There, I think, I must go into another question, and that is our patent law. These patents will be controlled by foreigners and are at the present time controlled by foreigners, and we cannot even use our own water power or our own coal to supply the materials for our own guns.

1921. (*Chairman.*) I am afraid I must refer you to the President of the Board of Trade on that point; this question of the patent law is not within our reference?—I was a member of the deputation to the Board of Trade upon the patent law. I am sorry I am going away from the question. My point is this, that from time to time in an exhibition you get the first idea of what may be very important inventions indeed, either for our commerce or for our national defence, and in other ways it may be important. I think, therefore, that each department of the State should be represented on such a committee.

1922. Would it not be on the organising committee, and would it not be represented in some way at the exhibition? Would not each department have somebody looking out for what is interesting to that department?—I think it would be very important that there should be somebody there, and that some of the jury should be deputed by that department to represent their interests there and look out and report to their special department.

1923. Would you suggest that the duties of jurors, besides advising on prizes and on awards, should also comprehend a general report on matters which would be interesting to the various departments at home?—Precisely, with the exception that each juror should not report generally, but that special jurors should report on their special branches as relating to A, B, C, or D, as the case may be.

1924. Do you think there would be a difficulty in getting jurors to do that?—I do not think there would be a difficulty in getting them to do so, but whether you can get them to spend a very long time for nothing is another question.

1925. That is what I meant; would they like to spend the necessary time at the exhibition?—It is very easy for a man who, for his own information, is col-

lecting all the data possible to draw up a short report; but if a man is to be deputed specially to go over the whole place with a definite object in view, that would take a great deal of time.

1926. To go to another matter connected with these exhibitions; do you think that the awards should be continued? Is it an essential part of the system to have prizes, medals, *diplomes d'honneur*, etc.?—I am afraid I should be considered a little disloyal as a juryman if I were to give you any definite opinion upon that; but I can hardly help saying that awards do not now occupy such a high position as they did occupy. On the other hand, there are many commercial firms who would not exhibit at all if it were not for the advertisement that they get in that way.

1927. They would not exhibit for the mere chance of selling their goods, would they?—No. There are many firms that I know personally who only sent their goods to St. Louis so that they might publish an additional award at the head of their notepaper and invoices, and in their advertisements.

1928. I take it that you would rather like to do away with the awards, but you do not see your way to do so?—I think you have summed it up very well indeed, better than I could do it myself. I do think the awards have really deteriorated in their value. There is another thing with regard to these awards, and that is that when a first-class firm has got the highest award there is nothing more for it to get except a ditto, it can only go on repeating; and the award then is not of such a value to them as it would be to a younger firm. But it is a great advantage to a young firm, a firm that is establishing itself, to get an award and to show that it is already in the field, perhaps rivalling the older firms against which it competes.

1929. Do we not want to bring up all these younger firms? Is it not desirable that we should have new firms and new brains and new blood coming into our industries?—I think that is really the life of an industry. I think if we were simply to depend upon the old firms and the old methods we should be absolutely stationary.

1930. I do not think I asked you whether you attach much value to there being a Royal Commission for these big exhibitions, and whether the fact of there being a Royal Commission is valuable?—It has been our usual way; that is all I can say for it.

1931. What is your experience? Do you think that they justify their existence?—I think we have so many good men in the country that you can put almost anyone forward as administrators, and so hitherto it has worked fairly well. But every time there is an exhibition to take new men who have had no practical experience of exhibitions and put them all together, and to tell them to do their best, is hardly fair to them, nor is it the best way of doing the work. I think there should be some continuity in those things.

1932. But your chief recommendation is for this representative body?—That I think would be most useful. With regard to jurors, there should be some continuity. One point I should like very strongly to emphasise with regard to the jury is this, that our British jurors have no instruction whatever in their duties. They go there and they are quite helpless because they have not had the instruction that most of their foreign competitors have. The consequence is that British firms may have awards which do not compare favourably with those obtained by the foreigners.

1933. Do you mean that the foreign jurors are briefed, as it were, and told how to proceed so as to get most awards for their countrymen?—The rules of most of the exhibitions do not make the awards dependent upon the excellence of the goods which are exhibited, and there are many other things that come into play. They take into account the time that a firm has been established, the awards given at other exhibitions, and many other things. The British juror in this country at every show and every exhibition goes there and he looks at a thing, and if it is good he awards a prize, and if it is not he does not. That is not the case with an international exhibition, and none of our jurors seem to know that. I think one of the most important things in connection with international exhibitions should be some instruction given to our jurors as to the way in which they should carry out their duties. Generally, on the question of bribery, I should say you should have jurymen who are quite above anything of that kind, and who are in such a position that they are not liable to be bribed.

1934. (*Sir James Kitson.*) You were suggesting the value of exhibitions as a means of different nations, our own for instance, acquiring information by the exhibits that they see. Do you not think that is rather an antiquated way now for highly organised industries to obtain information? Take those who are connected with the Society of Chemical Industry, or with the Institution of Mechanical Engineers, or with the Iron and Steel Institute, and all the rest, and take the papers, highly technical papers as they are, which are read there, and the scientific information which is there given and communicated throughout all Europe; take also the foreign correspondents which are supported, as you know, by each of those institutions to collect scientific information. Having regard to those I suggest that, as a means of acquiring information to the advantage of our manufacturers, exhibitions are not now of much value?—There are two ways of looking at that. I think they are for this reason: In the first place, I read many papers myself before technical societies, but when there is any important industry connected with it I, and I think most of my colleagues, take very good care not to put in these technical papers the little details and particulars which are essential in carrying out a process. For instance, with a machine of course you have to give drawings, but even there you need not disclose the most essential parts in those drawings.

1935. Do I understand you to say that you could make a drawing of a machine without disclosing the essential point of the operation of that machine?—Yes.

1936. Do you really say so?—Yes, I do. I have met that in patent specifications; it is a great trouble, in fact. You will get a patent specification which will give you a drawing showing the machine as regards the point patented, but all the rest of the machine need not be shown, and it is not shown if they can help showing it. Therefore, although you have got the point patented, and that is quite clear, the rest of the machine you have to make up yourself from what has been done previously. If you are very clever and know everything that has been done, you can do it. That is the point that is in my mind with regard to that. I very often have to give evidence in the Courts of Law on patent cases, and we often find that there is a great deal that is not disclosed—that one point which is essential in the working or in the making of the machine is disclosed, and the rest is not. I must say I do that myself in every patent I take out wherever I can.

1937. I will give you a point: The French, as you know, designed a four-cylinder compound locomotive which is very well known; it is very successful, and drawings of that were published in the scientific journals; how would it be possible to conceal essential points in such a machine as that?—The novelty there would only be a part of the machine, and the other parts of the machine would be so thoroughly well known that it would be very difficult indeed not to disclose them. But still, even there details might be omitted which might be essential in the working.

1938. I am sorry I do not agree with you?—You think not. If a man made a drawing that he wanted to work by he would put everything in; but if he, on the other hand, did not wish you to work by it, he would omit everything that he possibly could while giving you a general impression.

1939. Just now I interjected a question about the manufacture of nitric acid, on which subject you instanced Italy, Germany, and other countries where cheap water-power is obtained?—That was in my mind, although I did not say so.

1940. In Scotland cheap water-power is obtainable; I have had the honour of sitting on one or two Committees where the question of water-power in the North of Scotland was gone into, and it was shown that there is abundant water-power which I think could manufacture all the nitric acid that is wanted?—Our rainfall is more than sufficient to supply all our farmers with nitrogen from the atmosphere. That is quite true, and I agree with you entirely. But the difficulty there is the patent law. The other point with regard to your remarks is this, I think: However large a firm may be, and however skilled their technical experts may be, and also however good linguists they may be—which is another important matter—I do not think that they could get so much information by wandering

Mr. W. F. Reid.

1 Feb. 1907.

through the whole of Europe as they can if people bring their best goods to show them all at one spot. I mean to say that in a month spent at an exhibition you can learn more than you can learn in five or six months wandering about searching for information. Probably you would not be able to get into the factories where those things are made if you were in the same trade. So I think the educational value from an industrial point of view of an exhibition of that kind cannot be got in any other way. People will show in an exhibition things that you, in the same line of trade, could not see in their factories.

1941. If you are a technical expert, of course you want an encyclopœdic knowledge of everything, but if you are a manufacturer you only want information on one specific point, which I suggest you could obtain through a scientific society more accurately and more easily than you would by searching in an exhibition?—You would get general information in that way, certainly; there is no doubt whatever about that.

1942. (*Sir Swire Smith.*) I think you said that the day of great international exhibitions is over?—I did not put it that way; at least I believe I put it that I did not think it was so advantageous now to hold a great international exhibition of all trades and industries as to hold special exhibitions of certain industries.

1943. Would you have the Government support special exhibitions?—I think, in regard to those, that it would be very useful indeed if you had a general committee to advise you. If a small country that was unable to do it were to attempt a great international exhibition, they would fail utterly, and the thing would not be worth sending our goods to. I will not say that the exhibition at Milan was a failure, because it did not attempt to be a general international exhibition—it was only a partial one. But the case might arise where a small country of limited means might start an international exhibition, and one would know beforehand that it would be a failure.

1944. What would you say with regard to local exhibitions or provincial exhibitions in this country, such exhibitions, I mean, as the Glasgow one?—I think they are very useful indeed.

1945. Would you favour Government assistance for those?—I would favour Government assistance, if they were not for the benefit of any local trade or industry, and if they were general. I do not think it would be fair that a Government grant should be given to foster a particular trade in any district. It would be right enough under the Education Act, but I do not think it would be right under such an arrangement as I would suggest for international exhibitions, at any rate.

1946. Do you see any means of drawing the line?—I have not considered where you should draw the line. I think it would be very difficult indeed.

1947. So it seems?—But I think a line could be drawn.

1948. You spoke of diplomas being of much less importance than they used to be, still you are of opinion that it is as important as ever to get the best exhibits?—Certainly.

1949. How would you get the best without the compensation that you gave originally to the exhibitors who got the diplomas?—What compensation?

1950. The awards, the advantages which they would derive from the exhibition?—I do not think you would get some firms to come at all if they did not get some award.

1951. When you were putting that point it occurred to me that an eminent firm, having got its award, might not take a particular interest in an exhibition afterwards, because it had nothing better to get?—There would be only the dread of competitors getting an award equal to its own, and advertising that. Therefore a great many of them come into every exhibition. Well-established firms cannot afford to let the others come alone.

1952. Therefore, after all, the question of awards is still important?—It is very important; and it is one of the standing directions to French jurors that they shall never accept any award for a French exhibit less than the award that has been given at a previous international exhibition. That is one of their definite instructions. We had many fights upon that at St. Louis. Upon the first occasion the whole of the French jurors went out of the room, and went to their Commissioner-General; but they came back again in half an hour, because, of course, that could not be upheld, as it was not according to the rules.

1953. Have you any suggestion to make as to how you can get at the best of everything for exhibitions? In every industry of course you want the best, and how would you get that?—I think the only way would be to get in touch with the whole body of people who produce these exhibits. Hitherto we have not been in touch with them. There is a case in point in the chemical exhibit at St. Louis. We were, I think, most distinctly in touch with the chemical industry. There is a gentleman here who can tell you more about it than I, Sir Isidore Spielmann. We really circularised, and one of the members of the Committee visited personally, nearly every manufacturer of chemical goods.

1954. And of course you would think that would be necessary in every other industry?—It is certainly. At Milan the maritime exhibits were so good because the English Commissioner was connected with shipping, and he got a splendid exhibit together. That shows what can be done if you get the right man in every branch.

1955. (*Sir Isidore Spielmann.*) With reference to your collective exhibit at St. Louis, how did it compare with the collective exhibit of Germany?—The collective exhibit of Germany was very curiously got up. There was a reason for that, I was told by one of the German representatives. They had a collective exhibit which yet contained the means of distinguishing the origin of each exhibit, but it was dealt with as a collective exhibit. The reason of that, they said, was the duty. They said that where the Americans found out that German firms were producing certain articles well in large quantities, they raised the duty on them at once, for the sake of American industry. That was the reason given to me by one of the German Commissioners why they had a collective exhibit in certain manufactured articles. With regard to apparatus, the German exhibit was far superior to ours, but with regard to many manufactured goods ours was far superior to Germany's.

1956. If you were called upon to form a collective exhibit for another exhibition, could you do it?—Yes, certainly.

1957. If you could do it in the chemical industries, is there any reason why collective exhibits should not be formed by other industries?—I think it could be done in every industry if you get the right men to put their shoulder to the wheel and do it.

1958. With reference to the juries, I think you were vice-chairman of your jury, were you not?—I have been vice-chairman of several juries.

1959. At the St. Louis Exhibition?—Yes; they put me on a good number of them. I think I was on six juries, and the superior jury as well.

1960. What is your opinion as to the payment of jurors? We have had a witness here who has told us that he thinks it would work better if jurors were not paid their expenses; what is your opinion?—My opinion is that then you would get men who have money and no brains; you would get men who would simply go for the pleasure of the trip in an official position, and who would probably carry out their duties in a perfunctory manner.

1961. In fact, you would not get the best men?—I do be very good men—I would not say anything against be very good men—I would not say anything against them as men—but I do not think they would be such good workers.

1962. Nor such good jurors?—A juryman, if he is worth anything at all, is generally very busy. To keep in touch with modern industry you have to be very busy, and you must either spend your time in learning technical or scientific principles and details or you must spend your time in the particular business you are engaged in. If you go abroad as a juror, you have to give that up; that is one loss. Then you have to put your hand into your pocket to find money for the expenses. I do not think it would be reasonable to expect all that, and I do not think you would find men willing to go unless they were men of leisure, and had either retired from business or had not anything else to do—that is, were amateurs.

1963. Consequently, in your opinion, they must be paid?—I think it is only fair that they should be paid.

1964. Are you satisfied with the way in which the jury work was done at St. Louis on the whole? You

have given us a few instances of dissatisfaction, but, on the whole, do you think it worked well?—Do you refer to the British jury?

1965. No, to the international jury which was engaged in judging the collective exhibits?—I am afraid you are inviting me to judge my colleagues. I could give instances where I do not think some of our foreign colleagues behaved quite fairly, but I do not think it would be judicious to do so.

1966. Can you suggest any improvement in the work of the jury?—Is that without regard to the British members, but including them in the whole?

1967. Yes?—I think myself that all the jurors, if it were possible, should be in the same position. The French jurors have a very great advantage over the British jurors. Not only may they themselves expect some little distinction from their Government when they go home, but they can offer it to foreigners. That costs nothing to the Government at all, but it is highly thought of by the people who receive it. I myself had a distinction offered to me by the French authorities, and I had to refuse it because we can give nothing in return at all. There is no order that we can give, there is no distinction of any kind that we can give, to the foreigner who assists this country. The French especially are very active in that way. They do give distinctions to foreigners who assist them; and, to put it from a sordid point of view, it is the very cheapest way of doing the work. So that we are not quite in the same position as some of the foreign jurymen.

1968. With reference to the Milan Exhibition, you said it was a partial failure. What did you think of the British section of it?—I do not think I said Milan was a partial failure.

1969. Then did you mean that it was an entire failure?—No; I meant that it was a partial exhibition.

1970. What about the British section of it?—I think what you have said is to some extent correct, that some of the sections were not good, that they were poor.

1971. How would you describe the British section as a whole, apart from the ship models?—It was scraps—little bits of this and little bits of that. There was no general British exhibit at all. It was a little bit here and a little bit there.

1972. That was organised by the London Chamber of Commerce, was it not?—Yes.

1973. It is stated that the London Chamber of Commerce has been invited to organise the British section for another Brussels Exhibition in 1910. What is your opinion as to the wisdom of allowing the British section being organised by the same body?—I think I have very plainly expressed my opinion that an exhibition, to be successful, should be organised by a committee that represents generally the industries, trades, and arts of the country. I do not think a Chamber of Commerce can be taken to represent more than the commerce of the country, and, as I mentioned before, without knowing that you were going to put the question to me, I think the merchants are not the ones to get the best out of an exhibition.

1974. I think you said that manufacturers benefit the most?—Yes, they would benefit most.

1975. We have been told by other witnesses that manufacturers are very often not allowed by their agents to exhibit; what is your experience on that point?—I know that it is so.

1976. That they cannot exhibit without the consent of their agents?—I know that if a manufacturer gives his agency in a foreign country to a firm, that firm very often does not like its principal to come and exhibit in that country. I think it is clear to a commercial man that it may possibly interfere with his own sales, or it may possibly lead to the principal firm coming to work the country themselves. It has happened frequently.

1977. Has the consent of the agent been withheld?—That, of course, depends on the individual conditions of each case. It is difficult to say.

1978. (*Mr. Malcolm Ramsay.*) Your view is, I understand, that exhibitions have a generally beneficial effect on the export trade of a country?—I think so, generally.

1979. Can you give us any details? Do you know of firms that have got large orders in consequence of exhibitions?—Yes, I have had particulars given to me. They have been satisfied.

Mr. W. F. Reid.
1 Feb. 1907.

1980. The majority of the exhibitors have been satisfied?—It would be impossible to say the majority have, but I do know of many individual cases where not only have they received orders, but where the awards which they have obtained have helped them in their home trade too.

1981. Would you tell us whether, in your opinion, you think that exhibitions are really a means of advertising trade all round, or whether there are only some trades which get a benefit from exhibitions?—I have considered that matter a great deal, and I have thought that if it pays any firm to advertise, it pays them to exhibit. You find a great number of firms who advertise constantly, and generally it is those firms who exhibit at exhibitions. It is a means of publicity which goes home to the buyer, I think, more than a casual advertisement in a newspaper. I think they make the same use of exhibitions as they do of the advertising columns of the newspapers, and I think that is proved by the fact that when the diplomas came from St. Louis a number of firms who received them actually had printed in a half-page above their advertisements the whole diploma. That shows that those people who have exhibited attach importance to the advertisement which is derived from the publication of the award.

1982. On the other hand, would you say there were a great many trades to whom the exhibition would have no attraction at all?—Personally I do not know of many, but I should think it quite possible there would be such. I know some firms say they never exhibit.

1983. (*Sir Swire Smith.*) The cotton-spinner will not get anything out of it, will he?—Perhaps not.

1984. (*Chairman.*) You know more of specialities than you do of the staples?—Yes.

1985. The great staples of industry do not exhibit, do they?—Not so much. A man would not exhibit pig-iron, for instance, and he would not exhibit cotton cloth, and those sort of things; but at the same time I think it would be well for him to appear before the great buyers from all the countries that are at the exhibition. I think he would profit by it.

1986. (*Mr. Malcolm Ramsay.*) The only point I was trying to get at was whether you think many trades now left out in the cold might get some benefit from an expenditure of public money on exhibitions?—Yes, in this way, I think—that every trade is so connected with other trades that I think it would be impossible to benefit one without benefiting the whole community.

1987. Is it your experience that the same exhibitors go on from one exhibition to another?—You can look up the catalogues of a number of exhibitions, and you will always find certain names; but names, of course, drop out. People sometimes go to four or five exhibitions, and then their names drop out for some reason or another, and they do not reappear. On the other hand, new ones are continually coming in. They come in in shoals in each exhibition. I do not know whether that is an answer to your question.

1988. Can you place those new-comers under any general class? Are they people trying to build up a particular business?—It is "push."

1989. Or do you say they are people who are trying to push their trade in a particular country? I suppose they would fall into one of those two categories?—I think it is chiefly push, chiefly trade enterprise. The Germans are very strong at that. They will go and exhibit in a country where you would have thought they would hardly do any business at all, but they exhibit, and I suppose the trade comes in time.

1990. Are you satisfied that the total volume of our export trade is increased by exhibitions? I mean that in the case of those firms who exhibit and who may get a large number of orders, do you think they take the business of other English firms, or do they take business which formerly went to foreign countries?—I think if there is an English exhibit alongside a foreign exhibit in the same exhibition, and supposing that they are as near as can be apparently equal, the reputation of British goods is so well known all over the world that the English firm would get the prefer-

Mr. W. F. Reid.

1 Feb. 1907.

ence—I think that would be so, even if they were exhibiting alongside foreigners.

1991. Do you think English firms have got business which formerly went to other firms in this country?—Is it the question, do firms which exhibit take trade away from those which do not?

1992. That is what I meant?—I have no means of answering that.

1993. Can you tell us some of the grounds on which people who were asked to exhibit at St. Louis refused?—I could tell you some of them. The bulk of them I must say—by far the larger number of them—simply said, "It is no good; we have got such a tariff against us; we could not send the goods if we got the orders." That was the one thing. Even firms who would willingly have exhibited here in this country, or anywhere else where they could send the goods, found the tariff so much against them. It was asked, "Do you know how much we have got to pay?"—I might know or I might not, but in any case the tariff was prohibitory.

1994. Did they ever meet you with general objections to the value of exhibitions?—I have heard of cases, not many, where they have said, "We are not going to give our ideas away to other people." It is generally from the old-established firms I have found that; I do not know why.

1995. Have you ever come across a general feeling on the part of manufacturers that exhibitions have little practical use?—Not as a general feeling.

1996. But you have met with it?—Yes, I have. There are many who say they are no use, and many who say that the good that they bring to them is not in proportion to their expenditure. That is the way that I have heard it put. It costs so much, and they do not see the prospect of an immediate return for the money which they will have to spend.

1997. May I ask whether you think that the manufacturers who do exhibit get more advantage from exhibitions as an advertisement, than they would by their own private advertisements which they pay for exclusively themselves?—I think that many people who would not read the advertisements—foreigners, for instance, who are not able to read the advertisements in the English papers—would see the goods, and would say that is just the thing they happen to want, and then would order it. I think exhibitions reach a class of people that advertisements will not reach, and never can reach.

1998. Could you give us your view as to the extent to which the public should subsidise exhibitions? How far should the State go in paying the expenses of exhibitors, or in giving grants for the representation of England at exhibitions?—I think the most remunerative use of the money is in the organising of collective exhibits in different trades. You would get more to show for the money spent in that way than in any other way. But then, of course, you have to consider the question whether you should pay the carriage of these exhibits.

1999. Do you think the public should pay the carriage?—I think it depends upon what the cost may be. I think you could not have got the manufacturers to have gone to St. Louis, for instance, if they had had to pay the whole of their expenses. It depends on the particular exhibition. You might get them to do that in respect to Belgium. Our railways and other people have made it cheaper for foreign traffic than for our home traffic, so I do not see that there would be any difficulty there.

2000. Would you relieve the exhibitor from payment for the space he occupies?—If you want to get a really good representation of British industry, the more facilities you grant the exhibitors, naturally the better it is.

2001. I quite understand that from the point of view of the exhibitor?—If we want to place Great Britain at the head of an exhibition, then if we give free space and pay the carriage, we should get an enormous lot of exhibits, of course, but it is relative in each case.

2002. As it is a good means of advertisement to the individual who exhibits, is it unreasonable to ask him to pay a fair proportion of the expense?—No, I do not think so at all. I think he ought to bear a portion of the expense.

2003. These exhibitions are becoming very frequent, and if the State is to participate in all of these it seems that this would involve a very considerable financial burden?—Yes, it would.

2004. If the manufacturers are not willing to pay, does that not rather imply that they do not think they are going to get direct advantage?—That is quite logical, and it is quite correct that it is so. I think that if you had a committee which represented the whole trade of the country (and the ratepayers, too, necessarily) you would find that they would discriminate between exhibitions which were worth exhibiting at and others which were not. They would have a full knowledge of the value of money, of course, because they are the people who pay the rates and who pay the taxes. But there is another point about exhibitions which I do not think has been touched upon since I have been in the room. It is that we have a position as a nation to keep up. Much of the money would have to go towards that.

2005. That is the first aspect of the question, but the point we have particularly to consider is the commercial side of it. Of course, there are international grounds of policy which cannot altogether be separated, but which form rather a different side of the question?—It would mean an extremely heavy expenditure if you were to represent the country as it should be represented. For instance, in the United States each department spends an enormous sum of money in exhibiting at these exhibitions. In St. Louis they had most magnificent exhibits, and the Smithsonian Institution and others spent a lot of money. Public money spent in that way brings no profit to anybody.

2006. (*Mr. Harris.*) You leave a very uncomfortable impression on my mind by your description of the methods of juries. Do you not think it might be wise to bring home to British manufacturers that after all the methods of juries leave the award practically valueless, as it does not necessarily reach the best goods?—I think I was careful to say that it was only in individual cases that the juries act in that way. I think the question was put to me whether I considered the awards satisfactory at St. Louis, and I think I said, "Yes, on the whole." When I mentioned cases like those you have in your mind, that was simply to show that British jurors should go prepared and forewarned. At St. Louis a general meeting of the jury was held by Sir Charles Watson, who foresaw this, and knew something about it, and the jurors there were, to some extent, initiated into the mysteries which they would meet with; but at Milan nothing was done at all.

2007. Mysteries or no mysteries, initiation or not, are we to understand that you do not, as a rule, get an award simply for the best goods?—I should not like to put it that way at all.

2008. Not so strongly as that?—No. Perhaps I had better read you one of the regulations, as I think that will show you the point better than I have been able to put it to you. The maximum number of points was taken at St. Louis to be 100, ten points being given for the "magnitude of the business represented, as measured by the gross sales during the calendar year preceding the opening of the Exposition." A British juror does not know that, nor does the exhibitor know it when he sends in his goods; and yet he ought to be told. Then "quality or cheapness, with reference to the possession by the exhibit, of highest possible quality, or the fact that the article is sold at so low a price with reference to its quality as to make it a valuable acquisition to the purchaser." Then the "length of time the exhibitor has been in business." Marks were also given for the "number and character of awards received from former Expositions." The British exhibitors do not say what awards they have.

2009. This is my point. If that were made known to the British trader, would he not say, "That sort of thing is not worth going in for at all"?—I would not put it that way. I think it is the bad organisation of our own exhibition department which is the cause of that. The other nations know this, and are prepared to meet it.

2010. The point I want to make is this: Are not those suggestions which you have read rather an unfair method of awarding a premium to goods; and, therefore, if the British manufacturer grasps the idea that those elements enter into an award, will he not say, "Really it is not worth having"?—But I do not think they are unfair myself, and I do not say that they are unfair.

2011. But do you not think the object of an exhibi-

tion is to show the best goods simply?—No. I think, for instance, that the magnitude of the firm should be taken into consideration.

2012. Suppose you have better goods shown by a smaller and young firm; is that young firm entitled to the benefit of its best goods on its merits?—But you cannot always exhibit the goods. A firm I know very well, for instance, the Nobel dynamite firm, send a few dummies and put them in a case; yet they are the biggest firm in their line in the world. It would not be fair if you were to ask them to send a few tons of dynamite, smokeless powder and so on. There are cases, therefore, where the goods cannot be exhibited, and it is for those cases that these conditions exist.

2013. Is not the answer that those firms should stand out of exhibitions altogether?—That might be so.

2014. Because they have an article which is not capable of being exhibited?—If we took the word "exhibition" in its narrow sense, then it would certainly be so. If "exhibition" means putting the goods there, and, in our British way, looking at them and judging them so far as you can, then indeed it would be so.

2015. Then you do not look upon an exhibition as primarily adopted for pushing trade; but you look rather to its educational effect; is that so?—No. I think the two can be combined very well indeed, and I think they are combined.

2016. (*Mr. Algernon Law.*) You speak of the educational results of exhibitions, but cannot that education be obtained be merely visiting the exhibition, and not sending goods there?—It could be so obtained if all nations were to exhibit; but if all the nations fell out you would have no exhibition at all.

2017. Would that not be the best result in the end—that there should be no exhibitions?—That would be one way to work towards it, of course—to prevent the exhibits reaching the place. But if it is to be a direct educational exhibition, then a nation like Great Britain should be represented, too.

2018. Did you hear whether the British chemical exhibitors at St. Louis gained any commercial advantage later on from having exhibited—you were connected with them, I think?—I have heard no complaints at all; and I believe they were all satisfied. We got them awards in nearly every case.

2019. They may have been satisfied with the awards, but were they satisfied with their sales afterwards; was any improvement shown in their sales?—Firms that I am intimately acquainted with—and I am consulting expert to some firms—are satisfied. But commercial firms will not tell you about this.

2020. Did you hear whether the paper people had any success from it?—The English manufacturers were very poorly represented in that department, and I do not know.

2021. What happened to those who were represented?—I do not know, and I could not say.

2022. You suggested that it would be a very good thing if the Government sent out experts to visit exhibitions and report upon them, I think. You were not aware, were you, that that course had been suggested in the case of the St. Louis Exhibition by the Foreign Office in conjunction with the Board of Trade, and that we were told by the Treasury that if the Royal Commission could assure us that there would be a sufficient surplus shown from the grant to the Commission to bear this expense, they would consent. We asked the Royal Commission whether they would have the sum—I think we mentioned about £1,200 to pay eight men at £150 apiece, because we thought many men would like to take the trip for the information that they would gain for themselves. But the Royal Commission said that they could not say whether they would have anything over, though they afterwards returned something like £20,000 or £30,000 to the Treasury. You have not heard that, have you?—I have not heard that. My suggestion was not that the department should send out special experts, but that they should get reports from the jurymen who are experts in their particular lines. I think you would find members of the jury who would be able to report on every section of the exhibition.

2023. We anticipated that, and we thought we should have to offer them something for the job?—It would be extra work, of course, and they should be paid extra for it.

2024. (*Mr. Wilson Fox.*) Following up what you said just now about the jury system, I think I heard you say that points were given because a firm had been established for a long time. Are many points given for that?—I think it is five out of 100. It is not much, but it may be the turning-point in a prize or an award.

2025. Who framed those regulations? Was that an international understanding between the jurymen?—No. The committee of the exhibition in the States framed the rules.

2026. And all the foreign juries, including our own, had to conform with them; is that it?—Yes.

2027. If awards are given in the way which you have described, do you think that system has operated at all against the best firms competing, because they know those awards really are not worth very much?—No. When they compete they do not know anything about the rules, and a great many of them do not know anything about them afterwards, either.

2028. There is an impression among the British public that these awards, in fact, are not worth very much. Do you think that some of the best firms—the really leading firms in England—have got that in their minds, and that they do not care to compete for what they know is not a real honour?—I think many firms that have had the highest awards several times lose some interest in getting them again. It is only repeating what they have already got.

2029. Especially if they are given cumulative marks and it is taken into consideration what they have done in previous exhibitions?—Yes.

2030. What is the object of that particular rule about giving marks for the length of time which the exhibitor has been in business. In other words, giving extra marks to an old-established firm?—"As showing whether exhibit is a development of an original invention or is an improvement on the work of some prior inventor." They themselves give the reason, or a short reason, why they have put it in.

2031. (*Chairman.*) That is a very old regulation, is it not?—Yes, it is; but I ought to say that the rules at Milan were totally different.

2032. Did not the old standing of the firms come in there?—No, not at all; it was totally different at the Milan Exhibition.

2033. (*Mr. Wilson Fox.*) Have you different rules at each exhibition?—Yes; but there are certain points which are continually recurring. The reason I mentioned this was because our jurors are quite innocent of all these things, unless they happen to have been at an exhibition before.

2034. Do you think you could get a collection for the use of the Committee of all these rules for jurymen, so that we might see them?—They are in all the reports of the exhibitions; you will find them all there. Our British reports contain them.

2035. You told Sir James Kitson just now that you thought exhibitions make excellent places to go to for the purpose of getting technical information. If that is so, which I do not wish to dispute, does that not give some ground for the feeling in the minds of a number of our manufacturers that they will get their things copied if they send their goods to exhibitions?—You need not necessarily copy a man's goods, though you may gain information from them.

2036. But still, you would be wanting in ingenuity if you did not. If a man went to an exhibition to find something out, and he was in business, even if he did not copy it, would he not bear it in his mind, and do his best to adopt it when he got home?—Certainly; that is why I think our manufacturers should go, because they can learn a great deal more from the foreigner than they can teach him in most industries.

2037. Do you think we are so backward in this country that we have more to learn from the foreigner than the foreigner has to learn from us?—No; but I think the accumulated invention of the rest of the human race is rather more than the invention of this small portion of it.

2038. Do you not think that in the trades in which we are predominant—and we are predominant in certain trades—we should be likely to find the manufacturers refusing to exhibit?—I do not think they would be giving themselves away if they did exhibit, because if the foreign manufacturers want any information it is the easiest thing in the world to get it from

Mr. W. F. Reid.
1 Feb. 1907

any trade in Great Britain. You can go and buy their workmen up. Give a man £1 a week more and he will go to them, and there is nothing to prevent it.

2039. Do you find that our workmen will go abroad on those terms?—Very willingly. You may find them all over the world.

2040. You do not find them much, except in America, do you?—Yes; you do in Russia especially. There are numbers of them in Russia. They have started the chief industries there, and they got the machinery to start the industries through England.

2041. At any rate, it is your opinion that there is no danger in the British manufacturer having his goods copied by sending them to exhibitions?—I will not say there is no danger, but I say the danger is so small that the benefit he would derive from going to an exhibition would be greater than the loss occurring to him.

2042. You suggest that there should be a committee to run exhibitions and to manage exhibitions, and you say that it should consist of technical societies, I think?—And industrial societies.

2043. Then you would include Chambers of Commerce, I suppose?—Yes, certainly.

2044. Therefore it would be rather a large committee?—Yes, it would be a large committee.

2045. Then you say there should be departments of the Government represented?—Certainly.

2046. You would only have certain departments of the Government represented, I suppose—the ones likely to be affected by exhibitions?—Yes, I think that would be so.

2047. Some of the departments of the Government would not be affected at all by an exhibition, would they?—No.

2048. Would you have the trade element predominant in such a committee as that, or the official element?—I am afraid it would be rather serious if it were altogether official. I think the trade element should have a voice in the matter equal to the official element; but at the same time it is quite clear that there ought to be a substantial official element present. The Treasury would insist upon that in any case.

2049. If there was a Government grant, would you suggest that it should be made to that body who would have the spending of the money?—Yes, I think so.

2050. Would that body which you suggest be a permanent one, or would it only be formed for each exhibition?—I think there should be a portion of them permanent, and I think that there should be means for continually rejuvenating that body. I think it would be a very serious thing if persons were named to represent certain societies or associations, and those men should continue to remain on the board for years and years without being changed. Their term of office should be limited.

2051. I am putting it to you, what steps could be taken to ensure some continuity of policy in a committee of that sort?—I think that could be done if you had the members nominated, say, for five years, and they were to retire at the end of five years, and the periods were to overlap. Then you would have a continuous policy. That is what we have in connection with the National Physical Laboratory.

2052. Then you would have a secretary, more or less permanent, who could carry on the records?—Certainly; you must have officials who would carry out the active work, and who must be linguists also.

2053. You have been to a good many exhibitions, I understand?—Yes.

2054. Have you considered that the British exhibit has compared favourably with the foreign exhibits?—In many cases not at all favourably; yet I have known what the country can do. I know it does not at times represent the state of the trade of the country.

2055. Can I put it a little higher—can you say that in most of the exhibitions you have visited the British exhibit on the whole has not compared favourably with the foreign ones?—In many of them that was so.

2056. Would you say in the majority of them?—Yes, I think so. Many of them are far away, and there are tariff questions, and so on, which affect our representation.

2057. (*Sir Swire Smith.*) We have not done our best?—It is not altogether that, but it is no good sending goods to people who shut the door in your face.

2058. (*Mr. Wilson Fox.*) However that may be, we are no worse off than other foreign nations, are we?—Yes, we are.

2059. The same tariff applies to them?—No, it does not. We have got discriminating tariffs against us.

2060. (*Chairman.*) Where—in the United States?—Yes.

(*Mr. Wilson Fox.*) But in respect of only a few articles?

(*Chairman.*) Such as whisky, pictures, and statuary?

2061. (*Mr. Wilson Fox.*) I really do not think that can be made a point of, can it?—I am not familiar with all the tariffs of all the countries, but I know that at St. Louis we had a very excellent lot of pictures, and there was a discriminating tariff of 5 per cent. against Great Britain as compared with all other nations.

2062. That is quite true; but let me take the general trade of the country. However the tariff may be for pictures and whisky, the same considerations as to tariffs apply to the foreign countries as to us, taking it as a general statement, do they not?—Yes, I think that would be so generally, but I am not an expert on those matters.

2063. In showing in America—with the exception of whisky, pictures, and statuary—we are not more handicapped in getting our goods in there than France or Germany, are we?—I do not think we are, except by our geographical position.

2064. We are not so very different to France in regard to our geographical position, are we?—France and Germany, for instance, have coterminous boundaries, and naturally more trade goes over a land boundary.

2065. I was talking of getting the goods to America?—Yes, I understand.

The Right Hon. the Lord Chief Justice of England (Lord Alverstone, G.C.M.G.), called and Examined.

Lord Alverstone, G.C.M.G.

2066. (*Chairman.*) I think you have been connected with several exhibitions?—I was on the Commission for the Inventions and Music Exhibition of 1885; I am not quite sure whether I was on the Commission for the Colonial and Indian Exhibition of 1886, but if I was not, I was on some of the committees; I was chairman of the Chicago Commission, 1892-3, and I was on the Paris Exhibition of 1900 and the St. Louis Exhibition of 1904.

2067. You visited most of those exhibitions, I think. I know you were at Chicago, because I saw you there?—I visited them all, except St. Louis. I was at Chicago for about ten days, and at Paris for about a week; and, of course, I visited the English ones constantly.

2068. Have you formed any opinion as to their effect on the manufacturing and exporting trade of this country?—One cannot go through the amount of work I have done in connection with them without forming some opinion, but I do not put myself forward at all as giving an expert opinion on this matter. It is a question I have very often talked over with exhibitors, and, so far as my experience is worth anything, I have formed a general opinion upon it.

2069. I understand that there are trades which have been benefited by these exhibitions, in your opinion?—I do not think that you can answer the question as to their having benefited the manufacturing and exporting trades in a sentence, so to speak. I think there are trades to which they have been distinctly beneficial, and there are trades which of recent years, from what one learns, to which they have not been beneficial, and some people say they have had a contrary effect. When you are dealing with this question of

Lord Alverstone, G.C.M.G. 1 Feb. 1907.

exhibitions, I think it is very important to keep in mind the great change that there has been since the year 1851 or the year 1862. I should say down to about 1870 to 1875 Great Britain was so far in advance of all the other nations that I should have said the exhibitions at which Great Britain exhibited were distinctly to the advantage of everybody here, because in many fields of the manufacturing and export trades we had absolutely no practical competitor, and therefore the more that British goods were seen the better. Since the great development of German industry and of American industry, not to speak of other nations not so powerful from a trading point of view, the problem has entirely changed. I think that since 1880 there are trades as to which it may be said that it is distinctly disadvantageous. Even up to the present time, or certainly up till the end of the last century, exhibitions were still very beneficial to many of the manufacturing trades like Manchester goods and special productions like soap, and I think—though I speak with great deference in the presence of Sir James Kitson—to certain of the engineering trades or certain classes of engineering. I should say most certainly to some of the makers of mechanical machinery for trades like wool-combing, silk-working, cotton-spinning, and certain minor industries. It is difficult to give any very typical instances to show that we are producing things that caught on or were likely to catch on when they were first seen. I think exhibitions were distinctly of very great value even up to the end of the last century. Unless any question is asked me which might refresh my memory, I do not think that I could myself indicate more clearly any trade that so far benefited. As to the class of export and manufacturing trades which to a large extent, as far as my experience goes, have not derived benefit, I have urged on many occasions during the last two or three exhibitions I have myself gone to see, the leading people in the trades with whom I have been brought in contact, partly through patent cases and partly through the interest I have always taken in scientific work and manufacturing work, that they should exhibit; but they have distinctly told me that the exhibitions were a disadvantage to them, and that the only result was that any ideas which could be copied, without very high technical knowledge in the particular manufacture, were copied in the foreign countries, and that, at any rate at the date of which I am speaking—since 1885—they considered that it has been impossible for them to exhibit with any advantage to themselves. I do not know that any particular advantage would be gained by my naming any particular trades in that respect, because I am quite sure there are others who could give the Committee better information; but I am satisfied that there is a considerable class of manufacturers among whom that idea does prevail—that the only effect of exhibitions is that their good things are taken away. To a certain extent that has been very much accentuated in America by the high tariffs. I do not think the feeling prevailed as strongly in the Paris Exhibition, although there I was told the same thing to a large extent went on by the Germans taking information from the British exhibitors, and not giving anything back.

2070. Have you anything to say as to the effect on British arts?—There I cannot give anything like an expert opinion. Artists and others whom I have met certainly think, many of them, that it is almost essential to British art that there should be exhibitions of British art, on the ground of the absolute necessity of keeping British art before the artistic world. Some have also told me that in branches of British art—for instance, water colours and what I may call the least expensive form of art—there is a distinct commercial gain. But I am rather afraid, from what I have learnt from Sir Edward Poynter and from others in connection with art—Sir Isidore Spielmann will correct me here if I am wrong—that direct pecuniary result to artists has not followed from exhibiting. In connection with your question, which of the particular industries or classes of industry have chiefly benefited by exhibitions, and in what way they have benefited, I want to say there is one aspect of exhibitions which must, I think, be kept in view quite independently of the direct beneficial effect on either the manufacturing and export trades or the injurious effect on them. I am convinced that it is absolutely necessary that British industries shall in some shape or other be represented at these exhibitions from the point of view of maintaining the British reputation, although I quite understand that an individual manufacturer may say, "I have nothing to gain and everything to lose by my manufactures being exhibited, and personally I am not willing to undergo this great expense for no great gain." I am quite satisfied of this—that, speaking of British trade as a whole, it is essential that the British reputation should be maintained by means of exhibitions or through exhibitions, as well as in other ways. If the result of any feeling that there is undue competition by foreign countries, or that individual manufacturers do not get any direct benefit by exhibiting, is that British exhibits practically disappear from foreign exhibitions, I think it would be lamentable; because I am perfectly satisfied that the indirect effect upon British trade would be very great. To put it shortly—if I am not occupying too much time—you must maintain the reputation of British manufactures in some way or other, and I think it would be impossible to regard solely the question of whether any particular trade has benefited, as being sufficient to enable you to form an opinion as to whether we ought to take part in exhibitions.

2071. Then you are rather inclined not to go into details as to the particular industries which have benefited or the reverse?—I do not think I can go further than I have. I may be able to answer a specific question about it, but I do not think I can myself remember any particular industries in which I could give instances beyond those that I have given.

2072. But you think from the general point of view that this country is almost bound to go on exhibiting?—Certainly.

2073. Have you formed any opinion as to the effect of exhibitions on the general commercial relations between the countries concerned?—I have not the slightest doubt that there has been enormous benefit.

2074. Would you say there is no question about that, then?—I do not wish to speak of the general commercial relations as between individual firms or as affecting individual firms, but I have not the slightest doubt that, speaking of the general commercial relations—such as improvements of intercourse and improvements of information afforded from one country to another, statistical information and scientific information—the result has been distinctly beneficial in every trade. I desire to point out—and I think the members of the Committee understand me—that that is quite independent of what I may call the personal individual benefit to any manufacturer.

2075. In regard to our formal question, "Do you consider that the direct commercial results obtained by the official participation of this country in international exhibitions has been such as to warrant his Majesty's Government in giving grants for the organisation of exhibits in future." I understand that you are rather inclined to distinguish between exhibitions and exhibitions?—Certainly.

2076. You think each case must be dealt with on its merits?—In the first place, in my judgment there must be official participation for reasons which I may as well explain now as at any later period. If I do not make my meaning clear the members of the Committee will be good enough to ask me, I am sure. I think in the early exhibitions you could rely to a very large extent on private enterprise. As I have said—and I do not want to repeat myself—it was so enormously to the benefit of British manufacturers and British inventors from 1851 down to 1875 to exhibit, that you could safely leave it to private enterprise and private energy. But since the causes have either operated or been thought to operate, to which I have endeavoured to refer, it certainly is impossible to get a sufficient representation, and it is impossible, I think, to get a representation in the classes of manufactures that ought to be exhibited. I think there must be official representation on behalf of any country that is going to exhibit with effect in international exhibitions. That leads me to the second part of the question—that is, what sort of grant should be given, having regard to the terms of your question? It seems to me that one important thing to be borne in mind is, as I have said, not the benefit to any particular inventor or manufacturer, however great he may be or however good his work may be; but the thorough representation of British trade and British commerce, British exports and British manufactures—including of course the Colonies. I have been convinced that you cannot properly carry that out without collective exhibits.

Lord Alverstone, G.C.M.G.

1 Feb. 1907.

I believe that in order to get a good collective exhibit you must put it in the hands of some superior authority. It is perhaps a little difficult to speak, even in evidence, about such a matter, but there is no doubt that trade jealousies—very natural trade jealousies—do, to a large extent, interfere with collective exhibits which are got up by private people. We did—as Sir Isidore Spielmann and other members of this Committee will remember—make very great efforts in the St. Louis Exhibition and also in the Paris Exhibition, but particularly in the St. Louis Exhibition, to obtain collective exhibits. Several of us visited particular industries and trades of which we knew the leading members, and in one or two—the sporting-gun trade, for instance—there was a very effective collective exhibit at St. Louis. But, not attempting to deal with any particular exhibitions, I am quite satisfied that, in order to secure the best benefit either in direct commercial results or in indirect commercial results, there will have to be in future an organisation of the British exhibits, if possible, by an independent authority, like some branch of the Government. That is all the more necessary, because if exhibitions are going to be continuous and to be more frequent, we shall not go to all exhibitions in the same way. But if there is an important exhibition, then I think the collective exhibits should be taken charge of, if possible. If an important trade like the cotton trade, or the gun trade, or the dyeing trade, or anything of that kind, take it up and then organise a collective exhibit—leave it to them, but I am satisfied that you cannot rely upon them only.

2077. In the collective exhibit it is not necessary that the individuality of each part of the exhibit should be merged, is it?—Not in the least.

2078. You could still keep a record of the different contributors?—Undoubtedly, and also you could give an opportunity to individual contributors—indeed, you could give the same opportunity to all of them—if they like, to take a greater part in what I may call the working of the exhibit over there as by sending over representatives. But you will never get over the jealousies in various branches of English manufactures—not unnatural jealousies; on the contrary, very proper jealousies. If the collective exhibits are not under some independent person's control, many will always think that justice has not been done to them. Although they are very good friends, many of the manufacturers of England, in their particular arts and sciences, yet still there is a kind of feeling that they may not have justice done to them if the collective exhibit is not controlled by some independent authority.

2079. As to that control, I take it that you would be in favour of some Government supervision, either by a Royal Commission or by a permanent organisation?—You are a little anticipating me there—but quite rightly. Speaking of the paramount organisation, I know nothing better than a Royal Commission, and I do not think it can be done by any permanent body.

2080. I am going to ask you if you have considered whether there could not be a permanent body, some sort of society or committee representing the different trade interests, composed of trade societies, chambers of commerce, and the different technical societies, and presided over and controlled by a permanent department, say, at the Board of Trade, which shall hand on the tradition from one exhibition to another?—I am afraid I have never thought of it. I think it is a very admirable idea, and one that should be very carefully thought out; but, as I say, I have never thought of what I may call an exhibitions department under the Board of Trade. Do not think for a moment that I say it is not a very good idea—I simply say I have never thought it out at all. If you recognise that you cannot leave this to private enterprise and private energy, I have never thought of any other means of doing it than by a commission *ad hoc*. I should like to think over your suggestion; I will send you a little note upon it.

2081. We should be very glad if you would do so?—With a permanent department under some sort of control, I think you would always want to have fresh men introduced for a particular exhibition in all the important cases, both from the point of view of not getting too much into a routine course, and from the point of view of getting fresh energy to work at it. Looking back at the last five or six exhibitions, taking three in England first—the Fisheries, the Inventions, and the Colonial and Indian Exhibition, there were separate bodies for each, and I do not think those exhibitions at that day would have been as well managed if the same body had done all three. I do not think Chicago, Paris, and St. Louis would have been equally well done if it had been done by the same commission. But I should think now in the present day there is a great deal to be said for having what I may call an exhibition department of the Board of Trade or some Government Department.

2082. A small department to continue on the work?—Yes. A great deal could be said for it. It will not take the place of a special organisation; but it might be very useful as affording general information.

2083. For one thing it could keep the records?—Certainly.

2084. Do you think that would be an advantage?—It would be a great advantage to have all the records in one place.

2085. We have found a great difficulty in getting hold of the records of exhibitions?—There is the greatest possible difficulty about it. A certain number of copies are printed, and those that are not actually given to the members of the Commission and to leading men in the trades, or go to the public libraries, disappear altogether.

2086. Perhaps you are aware that if it had not been for the society you are connected with, the Society of Arts, we should have had greater difficulty in getting the records than we have had?—That is perfectly true. I believe the Society of Arts has more of this information, probably, than any other body. But you are perfectly right; it is difficult to keep proper records of the sort of thing that wants to be done, unless they are all under one control.

2087. Do you consider that equally satisfactory results could have been obtained by private enterprise?—I desire here to supplement what I have said with regard to collective exhibits, by saying that I think that it is only in very exceptional instances that you can rely entirely upon getting collective exhibits from the trades by private organisation, and I think it is going to become more difficult. The more exhibitions there are, the absolute necessity of having the best possible exhibits will increase the difficulty of getting collective exhibits, unless some public department has the control and charge of them. I do not remember—Sir Isidore Spielmann will probably tell you—how many collective exhibits there were at St. Louis, but I do know that we tried in a great many trades to get the people to combine, and we found it hopeless to do it.

2088. Assuming that public money is, in any case, granted for the organisation of official exhibits, do you consider that a grant should be made subject to any special conditions as regards the accommodation and facilities offered by the exhibition authorities; and the number and quality of exhibits offered by British firms?—I do not quite understand what is meant by "the accommodation and facilities offered by the exhibition authorities."

2089. That refers to the amount of space offered and the good situation, and also to facilities for loading and unloading?—To my mind it is rather putting the cart before the horse. What I want is to see you do the best you can for your own exhibitors. Take St. Louis: If you have got behind you a big Commission and a strong Commission, or, we will say, a strong department of the Board of Trade, and you say, "Now we are going to do our utmost to make our British exhibit the very best," which pleases, of course, the foreign nation, you are in a position to demand facilities and accommodation. But I do not think it would be possible in the working of the thing to say, "If we get a grant of 25,000 square yards the Government will give £50,000, or if we only get a grant of 10,000 square yards they will give less." I think that is approaching it from the wrong point of view. I do not see how the amount of the grant is to depend upon the facilities that the exhibition authorities offer us. The amount of the grant will depend on the character of the exhibition, and the amount of the support that it is supposed it will get in the United Kingdom.

2090. Should it not depend on both? Should we take a costly part in an exhibition if we were not going to be well treated there, and have a large amount of space?—Does that not really depend on the character of the exhibition? Take, as it were the pecuniary question. I will take Chicago first. We originally undertook to do Chicago for £25,000—I think that was the figure, at any rate that is my recollection, and

I am sure I am not far out. What we got in the way of space and everything of that kind was not the least affected by that, and I do not even know that the American authorities knew the amount—in fact, I am pretty certain they did not. Within a year, or perhaps nine months after we started—because the Chicago Commission went on for three or four years—questions were asked in Parliament as to what part the British Government were taking in the Chicago Exhibition, and, as the Chairman of the Commission, I saw the Chancellor of the Exchequer (I think it was Sir Michael Hicks-Beach), and we got the grant increased to £75,000, or thereabouts, with which we did very well. I cannot quite conceive the Government saying to a foreign country, "If you will give us large accommodation we will give more money." Of course, you will not go to an exhibition at all unless you think you are going to get proper accommodation. I do not quite see how the grant could be made subject to a condition as to what the exhibition authorities offer you.

2091. But you think it would depend to a certain extent on the support which is going to be given here?—Undoubtedly. I think the number and quality of the exhibits offered by British firms is most important. You must remember that you do not know, and you cannot predicate or predict, how many exhibitors you are going to get. But we could judge very well from Paris the sort of support we were going to get for St. Louis, subject to the fact that each successive exhibition presents fresh difficulties, and there may be a greater reluctance to exhibit.

2092. Can you state briefly what have been the methods employed by the British Government in organising exhibits for international exhibitions?—You probably know, if not I can give you some instances, of what has been done. There were some collective exhibits in education; there was a very good one indeed at Paris, which was organised by either the Privy Council or one of the leading education departments. Then there have been collective exhibits of the Ordnance Survey, which were extremely satisfactory; they were done by the Government. There have also been collective exhibits of transport in some exhibitions which have been done by some of the great steamship companies. Of course, those are not very difficult things to organise, because they depend largely upon models, which are things which can easily be got together, and can be always kept and handed about. I do not think there have been any collective exhibits of mechanical engineering—at any rate I do not remember any. Then there were some collective exhibits from Woolwich of military things in one or two exhibitions. Those I remember, but I cannot at present recall any leading instances of collective exhibits up to the present time.

2093. (*Sir James Kitson.*) There has been a collective exhibit of railway rolling stock, has there not?—I remember seeing it, but I was not quite sure whether it was a collective exhibit. At any rate, it was not organised by the Government.

2094. Certainly not: it was organised by the railway companies?—I thought there was one at a place outside Paris.

2095. At Vincennes?—Yes; the exhibit at Vincennes was one of the most interesting, and one of the most popular.

2096. (*Chairman.*) Our next question. How do British methods compare with those of other countries, I do not suppose we should press you very much about that?—I can tell you very little about that.

2097. Perhaps I might say that we are getting a great deal of information from the countries themselves upon that point; but I should like you to give us your experience?—I will give it you in a sentence. All I can say is that the great pressure put upon us both at Chicago and with reference to St. Louis, was that Germany was organising her exhibits collectively, and was giving a very much larger sum of money than we were; and we were urged as a Commission to endeavour to put pressure upon the Government to give us more money, because of the large support which the German Government were giving in order to obtain a collective exhibit. It also occurred to a certain extent in France. Perhaps I ought to mention here one matter which I have forgotten, which is of importance in connection with collective exhibits. That is, that the result of collective exhibits is that you present, especially if organised by a Commission or by a leading authority, a very much better show or appearance in the exhibition itself. The whole department of the collective exhibit, perhaps containing fifteen to twenty individual exhibits, is decorated in one style or scheme, and you do not get a very poor decoration side by side with a very good one. What used to impress us very much was that France and Germany, as a rule, either got their exhibitors to agree to a common scheme of decoration, or themselves took the control so as to impose a common scheme of decoration upon them. So that it does involve the question of the effectiveness of the exhibit itself out there.

Lord Alverstone, G.C.M.G. 1 Feb. 1907.

2098. Of course you are aware that in the case of Germany certainly the Government methods are much more strict with their manufacturers than ours?—Very much more.

2099. And they impose their will on them?—They do.

2100. Now what, in your opinion, have been the chief causes of success or failure of British exhibits in the past, and in what way do you think that the defects, if any, could be remedied in the future?—Here I can say, it is pretty certain that up to perhaps 1880 or 1885, as I have already said, the interest of the great manufacturing firms was quite enough to ensure success. Since then, partly from patriotic motives and partly from acceding to requests made either by members of Commissions or by the Commissions themselves, many leading manufacturers have been prepared to go to very great expense from a public-spirited point of view; and also, as you now know, of late years, in connection with some of the great scientific researches going on in this country under the Royal Institution and others, there have been very magnificent exhibits sent out, showing the latest development of science in various ways, some under Mr. Mond, with the assistance of other men like him, which have certainly been well worthy of our country. That has, I think, been the main cause of success. With regard to "failure," I should not put it as high as failure. With regard to British exhibits not being so successful, I think I have practically said all I can say. It is owing to the difficulties that have arisen, and to the impossibility at the present time, having regard to the great expense of these things and competition, to get private individuals to take the same line that used to be taken 20 or 30 years ago.

2101. Having regard to the methods employed by foreign countries, do you consider that the appointment of a Royal Commission constitutes a satisfactory method of dealing with the organisation and preparation of British exhibits; or, if not, what alternative machinery would you suggest? You have already rather given your views on that point, I think, and you still rather prefer Royal Commissions?—With regard to that, all I can say is that I do not pretend to contrast the methods of foreign countries, because I do not know what they are. All I know is that the support the exhibitors get from Germany and France, and from other countries as well, was represented to us, I remember very well, at Chicago as being very much more complete, both financially and in other ways, than our own, largely due to the amount of money we had at our disposal. But, subject to what you have been good enough to suggest to me as to the possibility of a permanent board, to be supplemented, if necessary, by individuals *ad hoc*, I do not know of any better system than the Commission system.

2102. Are you satisfied with the present system of awards at exhibitions?—No.

2103. Do you think we could do without them, or improve the system?—I do not think you can do without them altogether, but I think they want to be very much altered. The whole jury system is a very difficult question. Of course if you do not have awards with regard to the smaller manufacturers, you will lose a certain amount of exhibitors. Whether that would be a disadvantage or not I do not really know. There are objections to the present system of awards. I have often thought about it, and how to meet them I do not really know. One is that large exhibitors, very powerful exhibitors, who undoubtedly are entitled to receive awards, if they do not get the highest, make such a fuss and put such pressure upon the authorities that the authorities give way. I would rather not mention names, but in a few cases in my own experience I have known the exhibitors say, "We will not accept anything except the highest," and some have gone so far as to say they will not receive anything at all—that I do not mind so much, because I do not think it matters. But undoubtedly the present system, I think, does lead to a great deal of influence being brought to bear upon

Lord Alverstone, G.C.M.G. 1 Feb. 1907.

the bodies who have to do with these adjudications, in order to raise the standard of the award which is given to a particular exhibitor. I think also that there are far too many awards given. But I do not think you can do without awards. I think there must be some recognition, or some standard of award, else the manufacturers will say themselves, "We really have nothing to show for any successful exhibit we have given."

2104. Have you anything more to say about juries?—Of course you are acquainted with the extraordinary difficulty in getting jurors, and the extraordinary difficulty in being satisfied that you do get the right people. I have always felt that if you got the right men, especially if they were under Government control and paid, that a small commission of experts would be far better than the ordinary jurors.

2105. (*Sir James Kitson.*) Your Lordship has pointed out that there has been a perfect change since 1851, and that the earlier object of exhibitions as a means of disseminating information and of obtaining information as to what others were doing has been changed?—Yes.

2106. I remember the time when we looked on you as the great engineering advocate; and in those days you will remember the foundation of the Institution of Mechanical Engineers, I dare say?—Certainly.

2107. And of the Iron and Steel Institute, the Chemical Societies, the Institution of Electrical Engineers, and so on?—Yes.

2108. All these institutions have been founded since exhibitions began?—Yes.

2109. I put it to you whether through them more accurate information is not obtained and more reliable knowledge disseminated, and, to that extent, whether the necessity for exhibitions and the need for our Government expending large sums of money through the Commissions for those exhibitions as a means of obtaining information, any longer exists? I put it to you that these societies have quite changed the condition of things that obtained in the days that you alluded to?—From an educational point of view I should think Sir James is quite right. I should think it is highly probable that the really energetic students, either in chemistry, or in electricity, or in mechanical engineering or in civil engineering, would in all probability get the information which is obtained and collated by these societies, and that for those students they would more than take the place of exhibitions. But I still do not think that those societies would take the place of exhibitions from a popular point of view. They certainly do not seem to take the place from the point of view of commercial relations, and I should have doubted whether they took the place from the point of view of the spread of public knowledge. But I agree entirely with Sir James Kitson that to a large extent for the professions themselves the dissemination of information by these societies has taken the place of exhibitions.

2110. I think you had the opportunity of recently seeing in my own city the manufacture of certain very heavy locomotive engines?—Yes.

2111. What possible advantage is it to us to send one of those locomotive engines, weighing 100 tons, over a continent, without an order and without its being sold, merely for the purposes of an exhibit?—It seems to me almost ridiculous—if I am to express an opinion, Sir James, on such a point in your presence. But I tell you exactly how it strikes me. I may be wrong, and therefore I would rather express my opinion so that I may be corrected. Take this very case of the engines for light railways. I saw magnificent exhibits at your works at Leeds. I suppose all through the civilised world this question is coming before all the civilised nations, and I suppose there is no greater or more interesting problem than to reduce the tare of your wagons, to increase the load of your wagons, to increase the power of your engines on narrow gauges and the general economy of the working of railways and also of an improved permanent way. I should have thought that an exhibit such as you say, weighing 100 tons, which was a complete departure or an immense improvement on what had gone before, might certainly indirectly—I should have thought directly—be an advantage to the manufacturer of the engines, from the point of view of the construction of railways in all parts of the world, remembering that as a rule these international exhibitions—and I am speaking of the big exhibitions—do draw together the representatives of all countries.

2112. I think your lordship knows that here in Great George Street we are surrounded by consulting engineers?—Yes.

2113. And that all the specifications, designs, and contracts for those engines arise here, and do not arise from exhibitions?—I daresay they do not.

2114. If they do not, then what is the advantage in exhibiting?—You have answered me, Sir James, if you are right. I do not put my opinion against yours for a moment.

2115. (*Chairman.*) We want your opinion, and not Sir James's just now?—I should have said, merely as a member of Commissions, and as having thought of this for a great many years, that great good might result. I will give you a concrete case of your Barsi railway stock, which is marvellous stock. Take the probability of light railways in different parts of Africa, and the probability of the extension of railways in other countries of the world, the southern States of South America, for instance. It is perfectly true that the greater part of those designs have been drawn by engineers within a quarter of a mile of this spot, but I cannot help thinking that if some German engineer has designed and exhibited an engine which he thinks is very useful for such a purpose, it would be a very lamentable thing if Great Britain had no engines to compare with it. I do not say it would do Kitson and Sons very much good directly, possibly not, but I think it would do the trade of England a great deal of harm if it was not there.

2116. (*Sir James Kitson.*) I think you have given me a point in the Barsi engines, because I think a firm in which we are interested has obtained from a consulting engineer in this neighbourhood a recent contract for the manufacture of those engines, which contract we could never obtain in an exhibition?—Very likely.

2117. (*Chairman.*) I do not think Sir James will break down the Lord Chief Justice?—I think he could; and I do not say he has not.

2118. (*Sir James Kitson.*) As representing the traders, I want to know why the Government should be called upon to spend this money on exhibitions; I want to bring out that point?—I can only say they should be called upon, because directly or indirectly, if properly managed, I think it ought to benefit British trade as a whole—not an individual trader, of course.

2119. Now we pass from commerce to art. I think I might remind you that the exhibitions of British pictures have resulted in British works being ordered for the Luxembourg, for Venice, and elsewhere, as perhaps you will remember now?—Some few I do remember. But I cannot carry this sort of thing in my mind, and I do not pretend to say that I know or have a strong opinion about the direct value of exhibitions to art from the commercial standpoint—that is, from the point of view of getting orders to artists or anything of that kind.

2120. (*Sir Swire Smith.*) Sir James Kitson has put a point with regard to steam engines; we could not say the same with regard to the general textile industries, could we?—No, certainly not. I have a strong impression that the exhibits of Platt's and the other great people in textile machinery have produced direct as well as indirect benefit to British trade. I should like only to say that it is possible that the extraordinary development of America may have shut certain markets to us, particularly having regard to the tariffs, but I do not think that is an argument against our continuing to exhibit that class of machinery.

2121. Carrying it from the machinery to the textiles themselves, surely you would consider it to be of great importance for the general education of the public?—I agree entirely. That is why I mentioned cotton goods and those sort of goods when I was speaking on that point.

2122. Would you give Government assistance to provincial exhibitions?—Do you mean provincial in this country?

2123. Yes, or sectional exhibitions like the motor exhibition or the electrical exhibition?—No, that is too small. I should say certainly not there. I am very glad you put the question. I think I should say that the Government ought never, as a principle, to give financial aid to anything but an international exhibition. If it is worth the while of a trade—the dairy trade, or the agricultural implement trade, or the bicycle trade, or the motor trade—to get up these great

local shows, I cannot think that it would be the duty of the Government to assist that particular trade.

2124. Do you consider it would be desirable to hold an international exhibition in this country at an early date?—I have been very much in favour of it, but, of course, my opinion is only that of one. I think one mistake we have made is not having a really great exhibition in England again. We were the original pioneers, and I always hoped there would have been one in 1901, the jubilee of the 1851 exhibition. So far as my opinion is worth anything, I think it would be a very good thing to have a good international exhibition, but it must be thoroughly well done.

2125. And, of course, it would be a very great advantage now. You say that we have got to something like equality in equipment throughout the world in manufacturing a machine, and so forth; but it would still be desirable that we should have a great assemblage of exhibits of different kinds, would it not?—With regard to equality of equipment, I do not think we have got an equality of equipment throughout the world. I think there is great equality of equipment as between the United States and ourselves, and possibly Germany and France and ourselves; but I say we are certainly far better than many European nations, Russia, for instance, and many nations on the Continents of America and Africa. Therefore I do not think there is equality of equipment all over the world, but there may be equality of equipment amongst those nations who took the greatest part in exhibitions in the first instance.

2126. And that the time has come when probably we have as much to learn from them as they have to learn from us?—I do not know about that.

2127. (*Sir Isidore Spielmann.*) With reference to the collective exhibits at the St. Louis Exhibition, we had collective exhibits of art, chemical industries, guns, and ship models chiefly; assuming that we made great successes of these, do you think that with the same amount of trouble, success might not also have attended collective exhibits in other directions?—I ought to say, in order to correct a mistake that I made before, that I believe the art collections at the exhibitions have nearly always been collective. I ought to have drawn that distinction; I forgot it at the time, as I was not thinking so much of art. I entirely agree with Sir Isidore Spielmann that with effort there might have been a very great collective exhibit in many other trades, even in the smaller trades. But the real point that I feel about that is the difficulty of finding who has got sufficient influence and power to work it. We sent people round, particularly at Chicago, and before St. Louis, to endeavour to induce some of the Irish exhibitors, as you remember, Sir Isidore, and some other people to do it. I am not so sure that it could not be done. All I say is that under Government control and organisation there would be a far better chance of getting a collective exhibit than there is by allowing the manufacturers themselves to do it. I see no reason why it should not be effected in many other branches if you can get the right people to work it.

2128. Can you recollect what took place at Chicago with reference to the awards? Was there not some unpleasantness?—There was not any real unpleasantness about the awards. You know there have always been a certain number of agents going about, who try to declare that they could succeed in obtaining awards by their—efforts—that is what I should call it. I do not remember any real unpleasantness beyond this, that in a considerable number of cases we had appeals from the awards, which had to be reviewed by a very responsible committee, and we did at times alter the award. I should not say there was unpleasantness; I should say rather that there was the sort of effort and endeavour to which I referred in answer to the Chairman's question. I do not think it ever amounted to unpleasantness. I do remember, in connection with the exhibition at Chicago, that a man absolutely refused to take an award because it was not high enough, and we would not increase it. It was of as high a grade as we thought the exhibit was entitled to, but of a lower grade than the exhibitor thought he was entitled to. The result was that he would not take any. I do not remember any greater unpleasantness than that.

2129. May I ask if, in your opinion, the grants given to these international exhibitions nowadays are sufficiently large?—No, I do not think they are. They are certainly not sufficiently large if you are going to place this country on the same footing as others. But then I think you must remember this in that connection—that you must look at the British Empire as a whole. There have been very considerable contributions from the Colonies and from India from time to time, but on the general question, speaking of the amounts given by our Government, I do not think there have been large enough contributions in the last three or four exhibitions.

Lord Alverstone, G.C.M.G.
1 Feb. 1907.

2130. Do you consider that we spend too large a proportion of those grants upon our pavilions? We have been putting up very costly pavilions in comparison with other countries, and in the case of Paris and St. Louis, if you will recollect, we practically gave them away at the end of the exhibition?—Yes, we did.

2131. At St. Louis we got only £200, I think?—We did the same thing in Chicago, too, where we sold it for a few thousands. I will tell you what occurs to me about that. There has always been this very great difficulty that somehow or other—but it is rather to our credit—whenever I have been on a commission there has always been an objection to putting up a very flimsy structure. At Chicago ours was practically the only permanent building. I do not know whether it is still a yacht club, but I know it was used as a yacht club after that. In the absence of collective exhibits the Commission exhibit is a great attraction, and I believe—but I can only speak from hearsay—that it was a very great attraction at St. Louis. Certainly it was a very great attraction at Paris. It is a very difficult question, and I should not like to dogmatise too much about it. I think at times, particularly if the commissions are in a difficulty about the general quality of the exhibits, it may be wise to have a good representative habitation, but of course it is only indirectly productive; it is not directly productive; and probably we did spend too much money at St. Louis.

2132. Do you recollect how much was received for the pavilion at the termination of the Chicago Exhibition?—It is in the Society of Arts papers. I think it was about £2,000 or £3,000. It was a very beautiful building, though it did not compare very well with the enormous structures of Germany and France, because they were made of lath and plaster and canvas, and ours was made of really very good solid brick and terra-cotta, and there were very fine fittings inside. My impression is that we got at least £1,000 or £1,500. I may be wrong, but that is my impression. Of course, it is several years ago, so I do not pretend to recollect.

2133. With reference to the organisation of exhibitions, those that have not been promoted by Royal Commissions have in recent years been promoted by the London Chamber of Commerce, I think; for instance, the one in 1897 at Brussels, the one in 1903 at Liège, and the one last year at Milan?—Yes.

2134. May I ask your opinion as to whether you think the influence of the London Chamber of Commerce is sufficient to induce important firms to exhibit? I ask that question because it is stated publicly that the London Chamber of Commerce will organise our exhibit in Brussels in 1910?—All I can say is that as my experience goes, certainly not. I do not mean to say that very useful work has not been done by the London Chamber of Commerce, but, having regard to the exhibitions of which you speak, which were comparatively small, I should have thought there was no question about it, and that it would be quite ridiculous to give the organisation of foreign exhibitions to the London Chamber of Commerce. I think it would immediately promote jealousies with other Chambers of Commerce. It is not a national representation at all. I think whatever the organisation is, it ought to be a national representation, and I do not think the London Chamber of Commerce, although it has most able and influential people upon it, would be a national representation.

2135. (*Mr. Malcolm Ramsay.*) Did I understand you to consider that we should participate in, and spend money at all the international exhibitions abroad?—I did not mean to go as far as that. I had it in my mind that we have absolutely declined in some cases. I am very glad you have asked the question. It does give rise to a very great difficulty, because there is this perfectly ridiculous competition among the different States of America, that each new exhibition shall be bigger than the last, which of course is an absurd aspect or view of it. I should have thought the question can only be answered with reference to the importance of the place. For instance, I should have thought it a very serious thing to have a Royal Com-

Lord Alverstone, G.C.M.G.

1 Feb. 1907.

mission for either of the three exhibitions which have just been mentioned.

2136. I was going to instance those?—But, on the other hand, not to have had a Royal Commission at Chicago or at St. Louis would have been a very great mistake, and the same with regard to Paris. We had no Commission at Buffalo, if I remember rightly, and we had no Commission either at Philadelphia. I certainly do not think we ought to have a Royal Commission or any organisation of a national character for all international exhibitions.

2137. I do not know whether you are aware of the fact, but I believe the Government has attempted to observe certain principles in accepting invitations to participate in exhibitions. The first condition has been, that the exhibition should be held in the capital of the country, a second, that it should be directly promoted by the Government?—I was not aware of that, but it is the fact, and I think that is what has been the case in the exhibitions where there have been Royal Commissions.

2138. That was the ground on which the Treasury refused to give a grant for Liège, as perhaps you may be aware?—I did not know that.

2139. You would not have advocated a grant for Liège, would you?—Certainly not.

2140. Nor for specialised exhibitions which are now being started, like the Maritime Exhibition at Bordeaux?—No, certainly not. I think it ought to be distinctly international, representing all the interests of the countries who choose to exhibit there.

2141. As regards the amount of the grant, do you think the grant at St. Louis, which was £150,000, was insufficient?—No, I do not think it was insufficient, but I think we had to be careful. Had we had more money, we could possibly have done rather more in connection with the exhibits. But as far as I could judge, not having been there, I think the St. Louis Exhibition was a very great success from a British point of view, and I think the grant was sufficient for St. Louis.

2142. I ask you the question because the exhibitions tend certainly not to get fewer?—I quite agree.

2143. And the financial burden will become very considerable?—Certainly it will.

2144. Would you say in spite of this consideration that the results justify the public in spending money?—I certainly think the results justify the spending of money for some exhibitions on some occasions. I distinctly say not on all. I think the responsible authority ought to decide whether, having regard to representations made from abroad, the town, or the country, and so on, it is a good enough opportunity. I am distinctly of opinion, notwithstanding what Sir James Kitson has indicated, that it would, from a national point of view, be disastrous if we were not represented at the great exhibitions, and represented as a whole under the patronage of our Government.

2145. In the case of exhibitions where there is no diplomatic reason for participating, would you say it is better to abstain altogether than to do the thing on an inadequate scale?—I am not quite sure what is the class of exhibition that you have in your mind.

2146. Antwerp or Milan?—Milan I certainly should not have gone to. However, I think I should like to answer that question in this way—that it is much better to abstain altogether than to do it in an inadequate way. I would rather mass my strength on periodical exhibitions of a large character.

2147. (*Mr. Harris.*) Do you think that one could lay down, as the criterion of the exhibitions at which Great Britain was to be represented, the amount of good that representation was likely to do to our trade?—Of course it is a most important element, but if you put "criterion" on me, I think it is a little too narrow. You see, you cut out the considerations of art to a large extent there. I do not think I can go as high as "criterion," but I should accept it at once as being a very important matter from the point of view of an element for consideration. For instance, I can conceive a very large capital in some very great State in South America, or a place like that, where, great as the country might be or important as the town might be, one would feel that really it would be spending money with an insufficient result on the face of it. It is a very important element, but I do not like to adopt the word "criterion."

2148. So you would not say that the British manufacturer after all is to be the person to decide really whether it is worth while to take part in exhibitions?—Not the only person. Of course, that question would exclude what I should call general commercial relations. I think it would be a very lamentable thing if there was another great exhibition in Paris in ten or fifteen years time, and we said we would not have anything to do with it.

2149. That is what I was working up to. If the traders ought to have the chief say, is it your opinion that it is well worth while spending money on exhibitions?—The trader ought to have a very large say in it. His interest ought to be carefully considered by the authority which determines whether it be a Government Department or a Royal Commission or not; but I certainly do not think his should be the only interest to be considered, although it is a very important and large interest.

2150. As regards Royal Commissions, several witnesses have suggested that the system of placing our representation at exhibitions under a Royal Commission has led to complete absence of method; would you concur in that?—No, I certainly should not. I do not think they know much about it. Everybody makes mistakes; if they do not, they will never do anything. But, with a very considerable experience of Royal Commissions and their breaking-up into committees, I should say that the methods are quite capable of improvement; but may become very rapidly stereotyped and defective. I certainly do not think that any want of method or organisation has been due to the fact that the head organisation has been a Royal Commission, either in finance or art or engineering, or in departmental work. By particular subjects being referred to committees I believe the organisation has been extremely good.

2151. (*Mr. Waring.*) I understand your Lordship to express yourself very strongly on the point that commissions have the dual aspect of national and individual?—Certainly.

2152. And that from the national point, apart from the individual point, they are of extreme importance—Yes.

2153. I do not know whether your Lordship remembers Sir Robert Peel laid it down that in his opinion the gain to the individual was as nothing compared to the gain to the nation from commercial enterprise. May I put it this way, that, taking this as an industrial and commercial age, you would treat an exhibition in one respect as a national advertisement?—Yes. But when I speak of the individual, who may not receive the amount of benefit, it must be understood that I mean really an individual industry or an individual member of that industry. I think from the trade point of view that the direct benefit to the trade must be to the trade of England as a whole. You would not decline to enter into an exhibition because you felt that there were certain trades which it would not benefit if you felt there were other trades which it would benefit. I think it must be looked at as a whole, and as a commercial question from the Board of Trade point of view.

2154. That is from a national point of view?—Exactly; not from a Chamber of Commerce point of view, for instance.

2155. I quite concur in that point. Taking the next point, the question of the form of controlling and directing exhibitions, and the present method of Royal Commissions, may I suggest that we have had great experience in the past of Royal Commissions? Take Paris and Chicago, take St. Louis. Your Lordship states that the German and French courts have impressed you and other members of the Commission as being more effective than the English court from the dramatic standpoint, of the cohesion, the proportion, and the architectural effect?—Yes.

2156. With that experience in the past, why have Royal Commissions not utilised that experience and come on to a comparative basis with those countries, instead of letting us get behind?—I will give a concrete instance, which Mr. Waring will understand at once. What struck us very much indeed at Chicago and some other exhibitions was the French furniture exhibit, which was a very beautiful one. Of course, the French are very prominent in furniture, and the French furniture exhibit was most beautifully arranged. There were entrances to the court, and each of the manufacturers or exhibitors had their

Lord Alverstone G.C.M.G. 1 Feb. 1907.

own sort of area in the court, and the thing could be looked at as a whole as well as looked at from the point of view of the individual man whose table or cabinet or bedstead you saw. I am speaking about the artistic part of it. We endeavoured in one sense to do the same thing, but we could not get the exhibitors of cabinet work of that kind in England to combine. There are many great industries in England which do not lend themselves to the same treatment that furniture does. I can only say it was one branch of our general difficulty that in the different instances we had of combined exhibits, there was combined decoration too, and the Commission largely undertook it. But it is not the case that the Commission went behind from any want of endeavour. Where you had not got a combined exhibit, you could not have one system of decoration, because if it was not a combined exhibit, each individual exhibitor had his own way of putting up red, or blue, or green as he liked.

2157. I would like to state to your Lordship that I do not mean to suggest for a moment that in England in the past there has been any question of want of endeavour. All we are trying to get at is efficiency in the highest degree?—You must get your foundation-stone first, and if you have got the foundation-stone—a combined exhibit—then the Commission could organise the decoration of it as well as anybody else.

2158. Let me direct you to the Paris Exhibition, which confirms exactly what you say as regards the furniture courts. I think the comparative point there was that the courts of the Americans and Germans, who were strangers like ourselves, were dealt with in a much more effective and capable manner than ours?—Had they a combined exhibit or not?

2159. No, they were individual exhibits?—I did not know that.

2160. I am speaking of the treatment of their courts. One witness—I forget his name—on the last occasion pointed out that you did not know you were in the English court, really, until you caught an English name. You went into some avenue, and you saw a mixed-up collection of exhibits, and you were not quite sure that you were in an English court until you saw the name of Doulton, or something of that kind?—I think it is quite possible that something more might have been done in that direction if we had taken the decoration of the courts out of the hands of the individual exhibitors; but that, of course, involves much more direct spending of money by the Commission. Perhaps I ought to give one more fact that has not been mentioned before—that you must remember in some exhibitions the nations have been separate; that is to say, there has been an English court and a French court, and a separate area has been given for each; whereas in others the exhibits have been mixed up in the various classes. In Paris they were mixed up, if I remember aright. But I know that that distinction has been prominently before us; therefore I believe that the foundation of what I may call effective decoration is to get a combined exhibit; then I think we may do it.

2161. I suggest to your Lordship that that is one factor in the matter. Another which seems to strike one is this: Taking your point that you believe we should go very strongly into this question of exhibitions, I take it you would agree that we should endeavour to have the most effective court in the world, and that if we go to an exhibition we should not go into a second-rate, or third-rate, or fourth-rate position, but we should have the first court in the world. I would agree that the national point is an important one; but if it is necessary to help exhibitors, and if we recognise that we are in an age that is increasing from the industrial standpoint, do you agree that it would be desirable to contribute at least comparatively with countries like France and Germany in the future?—In amount, do you mean?

2162. In amount to help the exhibitors?—I do not think I have ever considered it from the point of view of quantity generally, or of a particular quantity. I think that our grants certainly cannot be less in the future than they have been in the past. I am not in favour of subsidising particular exhibitors, except in the matter of things which would really form part of the whole exhibition itself. Take textile fabrics: supposing we had a very large combined exhibit of Manchester goods—calicoes and linens of all sorts—and Irish goods too; then I think that the decoration of that court, which might very likely include 10 or 15 exhibitors, would be best taken in hand by the central body appointing some proper expert to have the decoration of that court carried out by combined effort, and paid for by the Commission, so as to take off from the exhibitor at any rate the mere ornamentation and decoration of the exhibit, from the point of view of getting a uniform and artistic effect and of relieving exhibitors to that extent. But that is indirect relief, and not direct relief.

2163. But can we leave out the factor of what Germany and France do for their exhibitors, in trying to induce the English exhibitor to come and make a great effort?—You cannot leave it out; but of course I do not know their method. If it is direct contribution or subsidy I should be against it.

2164. Would you be against it if the effect of it was that the English exhibitor said: "It is no use. I cannot compete with another country where the Government supports its exhibitor. Why should I?"—I should. Of course there are many nations that we cannot and ought not to attempt to compete with. Certain nations, ourselves most prominently, have got very great pre-eminence in particular points of manufacture, and it would be quite ridiculous of other countries to compete with us. I think that if Germany and France directly subsidise the manufacturer with a view to his exhibit it is wrong; but I think if Germany and France afford indirect facility—as, for instance, undertaking transport, undertaking decoration, undertaking insurance, undertaking the organisation out there, and policing it—it may be additional service to the exhibitors; but all those are things which can properly be called general charges, and they are quite legitimate. I do not believe in subsidising exhibitors.

2165. In view of other countries paying such expenses as freightage, would you help our exhibitors in that direction?—I think that it might well be considered, but I should not like to put money direct into the pocket of the exhibitor with a view to inducing him to exhibit.

2166. With regard again to the question of the Royal Commission, and the point of the expenditure at St. Louis, I understand that there was £53,000 expended on the Commission building there, on the cost of the various officials' travelling expenses, and on entertaining?—I did not know it was as much as that, but I will take it from you. I have not got it in my mind, though I have seen all the figures from time to time.

2167. I think it was nearly half the expenditure?—I thought we had £150,000.

2168. But I do not know that you spent it all?—Very well, I will take it so. What is your question?

2169. The point is this, whether that money was wisely expended, and whether it would not have been better expended in producing the effect I have just suggested on the courts, than on having a single building which was used largely for entertaining, and which, I understand, was practically kept for the Commission and their friends, the general public seeing little of it?—I do not know how that may have been. First, as regards the entertaining, I think that that is absolutely necessary within moderate limits. If you are going to have an effective international exhibition you must be prepared to spend a moderate but at the same time a fairly substantial amount of money in making yourselves thoroughly hospitable to the representatives of foreign nations. With regard to the central building, I certainly think it ought to be largely at the service and disposal of the exhibitors, as well as for réunions, for office work, for bureau work, and, if possible, also for private meetings. There was a complaint at Chicago, before I went out, that we had not allowed the exhibitors to have quite as much access to the Victoria House as they thought they ought to have. That was largely due to the fact that we had accepted a very beautiful furniture exhibit, which was very valuable, and we were rather afraid of its being damaged. But that was altered, and after I was out there I never heard any further complaint. I never heard of any complaint of there not being sufficient use of the Commission building at St. Louis allowed to the exhibitors. What you suggest is quite new to me, and I do not think it is the fact.

2170. I have heard that complaint made?—It is quite new to me.

2171. There is the further point with regard to the appointment made in connection with the general superintendency of that exhibit. Sir Charles Watson in his evidence stated that he thought the most important part of the exhibition was the question of

Lord Alverstone, G.C.M.G. Feb. 1907.

entertaining; would you agree?—No, that is not the most important part; but, in consequence of your being good enough to remind me of the point, I may say that I think it is a very important part. Just as I could not adopt Mr. Harris's word "criterion," I cannot adopt your word "*most* important."

2172. You will find that stated in his evidence?—It may be; but, you see, I do not know anything about his evidence. I think it a very important part, but certainly not the most important part.

2173. He had very little knowledge of commercial matters, and I do not think he considered that that was his function?—Sir Charles Watson was a most able secretary, an admirable secretary.

2174. The point of view is this——?—The point of view is this—that it is very difficult to find exactly the man with all the qualifications. You cannot do it.

2175. The point I would like to have your opinion on is the necessity in a commercial age, such as the present, of having at least a valuable and a big representation of commercial men and leaders of industry in order to avoid too great an expenditure or a disproportionate expenditure on such matters as (1) the chief exhibition building and (2) entertaining?—The same people who would be useful to control the expenditure on the exhibition building would not be the people who would be useful to control the expenditure on entertaining; but I quite agree that there should be proper control in both those matters. In regard to the question how much should be spent upon the building itself, I think the presence of commercial men upon the Commission or upon the committees controlling it would be very useful indeed.

2176. Would you not put it as the chief factor? The point being an exhibition of, generally speaking, arts, trades, and industries, the chief factor in the matter should be commercial representation, should it not?—I do not know.

2177. Taking into account the specific aim?—I have got in my mind the fact that there are so many different trades. Sir James Kitson would be most useful in the engineering department, and I daresay he would in the art department also, for all I know. Then there are chemical manufactures, spinning and linen work, shipbuilding and other work, coming down to smaller trades like jewellery and things of that kind. Commercial men in the abstract certainly, but I do not think that the Commission or any body, whether you call it a commission or not, could be properly worked if you had too strong an element of commercial men upon it. The commercial element has to be well represented; I should not go further than that.

2178. I take it that the commercial element in a case of that kind would see that there was not a disproportionate expenditure on (1) and (2); but such matters as our comparative position with other countries ought to be well looked after?—You want, to a certain extent, to have people who can control those people who have got axes to grind. You will always find a certain number of axes that want to be ground, and it is a great thing to have some independent people to check that.

2179. (*Mr. Wilson Fox.*) In the exhibitions which you have visited abroad, do you think that the British commercial exhibits—I mean commercial exhibits as distinguished from art and other fancy exhibits—have compared favourably with the foreign exhibits in those exhibitions?—The classes are very numerous. I would say in classes distinctly yes, but in other classes distinctly no. One has regretted at times the poor exhibit even in such things as machine production. I know that, though the electric exhibits at Chicago were extremely good, they did not half represent the electrical industry of Great Britain, largely because of the idea that had got about that Americans were so much in advance of us, which they were not. I should say that you cannot generalise upon that. In some exhibits we were distinctly superior, and in other exhibits we fell lamentably short, that being largely due, I believe, to the inability in certain trades to get people to exhibit in the present day.

2180. Or from various other causes?—I mean from the causes I have tried to indicate, which, rightly or wrongly, have struck my mind. I should like to say that I think the most important point which has been mentioned to me in connection with this subject is the question of a permanent domicile and a permanent department. Wherever it may be, whether it be quite independent of a Government body—probably better not—I think a permanent domicile, where all the statistics, literature, and experience of these exhibitions could be collected, is of immense importance. I am sorry it never occurred to me before. Whenever I have started work in connection with these exhibitions I have suffered from exactly what the Chairman was good enough to explain, namely, the difficulty of knowing where I was to get the information which I wanted, and I have always gone to the Society of Arts to get it; that is the fact.

EIGHTH DAY.

Thursday, 7th February 1907.

PRESENT:—

Sir Alfred E. Bateman, K.C.M.G. (*Chairman*).
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G.
Mr. Algernon Law.
Mr. Malcolm Ramsay, C.B.
Sir Isidore Spielmann.
Mr. U. F. Wintour (*Secretary*).

Mr. Arthur W. Down, called and Examined.

Mr. A. W. Down. 7 Feb. 1907.

2181. (*Chairman.*) You are a surgical instrument maker?—Yes.

2182. What is your firm?—Down Brothers, Limited, surgical instrument and aseptic hospital furniture manufacturers.

2183. Have you ever exhibited at any great international exhibition?—The only great international exhibition we exhibited at was the Paris Exhibition of 1900.

2184. What did you exhibit?—Surgical instruments and hospital furniture.

2185. Do you attribute any increase of business to your exhibiting?—So far as Paris is concerned, very little, but the time was very unpropitious for British exhibitors.

2186. You mean politically?—Yes, I do. I think that had a very serious effect upon British exhibits.

2187. As a fact, you do not attribute any increase of business to that exhibition?—We have had one or two slight openings as the result of that exhibition.

2188. Have you had any disadvantages? Have you had your goods copied?—Yes. Firms of repute suffer

from this disadvantage, but the presence of a judicious representative does, to a certain extent, minimise this disadvantage. We have exhibited at a very large number of exhibitions of another character.

2189. Special exhibitions?—Principally special exhibitions.

2190. Do you mean abroad or in this country?—We have exhibited at Montreal, Toronto, Johannesburg (South Africa), and in Berlin. Berlin was in December of last year.

2191. Do you attach any great value to the awards which you have obtained at these exhibitions?—You are now speaking of international exhibitions?

2192. I am speaking all through of international exhibitions?—You speak now of the Paris Exhibition, not of the small medical exhibitions?

2193. Were they international?—Yes, certainly; at Montreal, Toronto, and Berlin they were international. The Montreal and Toronto were the annual exhibitions held by the British Medical Association.

2194. They would hardly be international, but Berlin was international?—The American exhibitors were present very strongly at Montreal and Toronto.

2195. And you got awards competing with them?—There are no awards given at those exhibitions.

2196. Did you get any award at Paris?—Yes, we got a grand prix, and we also got a bronze medal in another class; but we did not specially exhibit in that class. We were not properly represented in that class. We were put into it at the last moment. We did not ourselves wish to exhibit in that class, but we were put into it because of the character of some of our exhibits.

2197. Do you think you have got any business from your award at Paris?—I think that an award of that character carries great weight. At home, in the colonies, and also in other countries we made use of that award. We had telegrams from all over the country congratulating us on the award, and we have used it continuously as an advertisement, and we have found it of value.

2198. Have you ever been induced to buy from British manufacturers or foreign manufacturers to any great extent from having seen their goods at exhibitions, and can you specify any definite points on which you have derived instruction or knowledge from visiting exhibitions?—Personally, I think exhibitions have been of use; of course, ours is rather a limited trade, but we have bought tools and machinery from time to time as the result of these exhibitions.

2199. You have not exhibited since Paris, you did not exhibit at St. Louis?—No, we did not.

2200. If you have refrained from exhibiting your goods at great international exhibitions, what were the reasons by which you were actuated?—We refrained from exhibiting at St. Louis because the duties are prohibitive; there was no prospect of establishing any market for our goods in America under those conditions.

2201. The American competition was so severe, counting the duty?—Yes. On most of our goods there is a 45 per cent. duty on going into the States. There formerly was some business done with the States, but that duty put a stop to it.

2202. Would it make any difference to your exhibiting if some provision were made for ensuring that British manufacturers were creditably represented among the exhibits of other countries, and some permanent organisation were available which would minimise the trouble and cost to individual exhibitors?—We are not disinclined to exhibit in any country where there is a probable market for our goods. We do not expect or desire any organisation to relieve individual exhibitors. Concessions as to carriage and customs are usually made. Those are advantages which an organisation might be supposed to further, but those are usually given at all exhibitions, therefore I do not think any new organisation could improve those conditions of exhibitors. We do not think any advantage would be gained by any organisation that might destroy individuality, or which would involve additional expenditure either by the Government or the exhibitors themselves. That refers to two different points. In some sections there was a general scheme of decoration—the American section, for instance, and that must have been put up at great expense. I believe it was paid for originally by the Government, I am not sure. I understood an exhibitor to state that they would have to bear contribution, and I think that that expense was unnecessary.

2203. (*Mr. Malcolm Ramsay.*) At which exhibition was that?—Paris.

2204. (*Chairman.*) I suppose your goods are such thorough specialities that you do not depend much on the decoration of the court. Your goods are entirely for themselves?—I have here a sketch of our stand at the exhibition. (*Produced.*) We had to erect that entirely ourselves, and that was done at a cost of about £300. It is all tiles, and you will see the floor is done with terrazzio. What I want to point out is that each exhibitor must construct a stand that is suitable for his particular class of goods.

2205. You do not want that done for you according to a plan made by a committee?—No, I think not, because I think from constant experience at exhibitions that you want something to suit your particular business and your particular requirements.

2206. You do not want to take part in a collective exhibit?—No, other trades might, but I do not believe in a collective exhibit.

2207. You do not think that is advisable for your particular trade?—No, we have no collective organisation in our trade, we are all fighting each other strongly.

2208. I suppose there are not a great many in your trade?—There are very few; it is a very small trade, therefore it does not allow of that sort of thing.

2209. You depend more on the doctors and the hospitals, do you not?—We depend directly on the hospitals, but it is always through the influence of the doctors. It is for the surgeons we work.

2210. In fact, yours is a very special trade?—It is a very special trade.

2211. To come back to general subjects, are you of opinion that this country should hold aloof from international exhibitions generally?—No.

2212. Do you consider it indispensable that an effective display of British machinery and works of art should be made at such exhibitions?—Yes, a sufficient number of representative British firms will always be found ready to exhibit. Individual firms will always have liberty of action, and can refrain from exhibiting when they think it opposed to their particular interests or those of the particular industry in which they are interested. We should not feel inclined to exhibit in all countries under all circumstances; in the United States we could find no market. I find that exhibiting at the Paris Exhibition cost us about £850. I went through the figures, and put them down, and found it was £847. If we had expended that money in America (and owing to the additional freight, it would have been more than that) it would have been absolutely thrown away, so that firms would not do that.

2213. That is because the duties are so high?—Yes, we could not hope for any market there.

2214. There is a very large market in America?—Yes, but it would be impossible to compete against that protective duty.

2215. Coupled with the strong competition of the surgical instrument makers there?—Quite so. German instruments and goods of a similar character are recognised as not being up to our standard, and one reason of it is, I believe, that when that duty was imposed I heard a German manufacturer state, and I heard others state: We will manufacture to pay that duty. They have a very large market in the States, but they bring down the quality of their goods; they sell them for price, while we go for the intrinsic value of the goods themselves.

2216. Do you mean they are more lightly treated by the tariff?—No; I mean to say that the whole tendency of the Germans is to say, "We will secure those orders at any cost," and therefore their manufactures are kept at a low level; they are determined to have this American trade, and they turn out stuff that will get into America, pay the duty and compete.

2217. You will not do that?—We will not do that. If we did we should lose our English trade.

2218. Have you any observations to make upon the

Mr. A. W. Down.

7 Feb. 190[illegible].

organisation of British exhibits at international exhibitions with which you have been acquainted in the past?—Yes.

2219. I think in the *précis* of your evidence you have mentioned the question of decoration?—Yes.

2220. You say you rather protest against large expense in general decoration?—Yes. I do not think that is necessary. I do not believe in paying for collective decorations, and I do not think the Government should be called upon to pay for collective decorations.

2221. Did you approve of the beautiful pavilion there was at Paris. Do you think that helped in any way?—I do not know exactly which you refer to.

2222. (*Sir Isidore Spielmann.*) The Royal Pavilion on the Rue des Nations?—That was splendid.

2223. (*Chairman.*) Do you think that was valuable so far as the exhibitors were concerned?—That is beyond my province, rather.

2224. I was not speaking with regard to surgical instruments, but from the general point of view?—I think everybody admired it and considered that England stood first in that matter.

2225. So you approve of it, though it was of no direct interest to you having a handsome building of that sort?—My remarks referred more to the government of the sections; that the Commissioner should be an official of the British Government, or a commercial man backed up by the authority of the Government so as to be in a position to command respect for the views of the British exhibitors. There were many little points which occurred. I might instance one. Owing to the delay on the French railways, and so on, our goods, which were dispatched in ample time so as to be beforehand, were not delivered. We had to put up tiles and turazzio flooring, and while the mortar was wet there came a general regulation, "You must put your four tons of goods on to your space." We said, "In our case it is impossible, because if we do we shall destroy our walls and our flooring." We could get no redress whatever. The answer was, "You must do it"; so all we could do was to say, "We disobey your orders and take the risk." We did not do it, and fortunately no one moved them on.

2226. Did you go to the British Commissioner about that?—We did go. I do not think we reached the head; that is a matter of memory. This same Commissioner should be able to command respect for his views. When we went to the gentleman who was there he said, "I cannot help it, those are the orders"; and he could not give us any assistance.

2227. (*Mr. Algernon Law.*) Do you know who that was?—It is a matter of memory, but was not there a gentleman named Lloyd there?

2228. (*Chairman.*) You think it was Mr. Lloyd?—I think that is so. We received the utmost courtesy, on the whole, from those gentlemen. I rather believe that British exhibitors on every hand were handicapped. We had an exhibit that required a great deal of light; we were put under a girder, we were packed away in a corner. We had a theatrical wig maker opposite to us. There were dozens of people who went there and afterwards said, "We searched and could not find your place." Of course, many reached it. The same happened to all British exhibitors. If one went through the Exhibition one could not but be struck by the fact that the British exhibitors had always got the worst spaces. This gentleman should be in a position to command respect; he should be a man of business aptitude and in sympathy with the exhibitors, always personally accessible to them; we ought to have someone in authority always personally accessible to us. I do not say this disrespectfully; but we do not want to be ordered, but asked our views with regard to things which are in themselves exceedingly small, and he should endeavour to carry them out to the best of his ability so as to assist each individual exhibitor, be ready to listen to their requirements and, as far as possible, meet them, so long as such requirements do not materially inconvenience the other exhibitors. He should also have a sufficient staff to carry out his orders, and all employed should have the command at least of two languages, English and that of the country where the exhibition is being held. Further, such a condition as this should be insisted upon, that at least one British representative should be on every jury where British exhibitors are concerned. If you look at the jury by which we were judged, there was no English representative upon it.

2229. Do you know why that was?—I think the French treated us very well; the jury were all of them highly qualified men and above reproach; but I think we should have had an Englishman there.

2230. You got the *grand prix* all the same?—We did.

2231. You are in favour of having a British representative on the jury?—Yes, that there should be a British representative on every jury concerning matters in which British exhibitors are interested.

2232. (*Sir Isidore Spielmann.*) Is not the reason of that that if there were not a sufficient number of British firms exhibiting in your department you would not be entitled to a juror by the regulations of the exhibition?—Then I think we are decidedly at a disadvantage in such a case.

2233. Perhaps you can tell how many firms of scientific instrument makers there were exhibiting?—There were very few.

2234. (*Chairman.*) I suppose your case is that naturally there are very few firms in your particular subject?—I think there were a good many in the section. If I remember rightly, we came in a section where there were 300 or 400.

2235. Anyhow, you would urge that as far as possible there should always be a British representative on the jury to avoid the danger of British exhibitors not getting proper recognition?—Yes, I think that should be the case.

2236. Do you know of any actual mischief because of that—in your case you got the *grand prix*?—I do not know of any actual mischief, but I remember thinking at the time we ought to have had an English representative.

2237. You did not get any damage from it really?—No, we did not.

2238. Have you any other suggestions to make?—At one time we had a caretaker, or "guardian" as he was called, in charge of our section who did not speak French. He should have been able to speak at least French and English, because visitors coming through would want information.

2239. (*Sir Isidore Spielmann.*) You do not remember how many English surgical instrument makers there were at that exhibition?—No, I really do not remember how many English exhibitors there were in that section, but there was no other absolute surgical instrument maker from England (Great Britain); there were many from other countries.

2240. That would account for there being no British Juror?—We were in a certain section.

2241. You say that Germany sells inferior surgical instruments fairly well in the States?—Yes.

2242. And the English cannot sell their superior instruments there?—The market is closed against us absolutely.

2243. In the States, although there is a prohibitive duty, the Americans will have first-rate sporting guns, why should they not be willing to pay for first-rate surgical instruments?—That I cannot answer. The most extensive factory of instruments in the world is in Germany, and that firm is connected with a great American firm, you may know the name; they employ thousands of workmen at a little place in Germany, Tuttlingen; the firm was once Jetter and Schaerer, it is now a company, the Actien Gesellschaft Jetter Schaerer; I forget the exact title; it has a branch in America which commands the market to a great extent. Of course there are some instruments manufactured in America itself that would compete with any that we sent over.

2244. You said you did not expect financial assistance in organising your exhibits, so I suppose your exhibit does not occupy much space, and does not entail any great expense in sending it; it packs very closely; exhibits such as you send pack very closely, do they not?—We should have been glad to have had three or four times as much space, but we could not get it.

2245. What space did you occupy at the Paris Exhibition, do you remember; what was the size of your case?—17ft. long.

2246. That is a fairly large exhibit?—We exhibited aseptic hospital furniture; we attempted to represent a hospital operating theatre fitted up.

2247. You would rather be independent of the commission than have any contribution towards the expenses?—Yes, I spoke more of the decoration of the

whole section such as the Americans, Germans and Austrians did.

2248. I think you said at Paris your exhibit cost you £847?—Yes, that was the cost.

2249. Did you get that back?—No.

2250. Certainly not from orders?—Certainly not.

2251. As the result of your having participated there do you not think you got a portion of it back?—I should think that having obtained the Grand Prix we might have obtained that back indirectly.

2252. I suppose you would prefer a Grand Prix to any orders you could take?—I think it was a means of obtaining orders; we advertised that all over the world. When we were first asked to go to Paris our great idea was that we should endeavour to obtain a high award, and we thought there would be a great number of Colonial and British visitors there, but I do not think we saw ten Colonial visitors there. We thought that every Colonial coming over to Europe would surely go to the Paris Exhibition. The time was very unfortunate for British exhibitors. I was a great deal about on the Continent both that year and the previous two years, and every Englishman knows the feeling that existed, and I think that had a very great effect upon our business.

2253. You were perfectly satisfied in having obtained the Grand Prix?—Under the circumstances we were.

2254. Have you exhibited at any of the smaller exhibitions promoted by the London Chamber of Commerce?—Not by the London Chamber of Commerce.

2255. Is Paris the only large International Exhibition in which your firm has participated?—Glasgow Exhibition in 1901 was an International Exhibition.

2256. Those are the only two that you have exhibited at?—No. That exhibition we found pay well. There was also the London Exhibition in 1881. The International Medical Congress met in London in 1881 at the Albert Hall or buildings contiguous to it.

2257. (*Mr. Malcolm Ramsay.*) I understand that the only exhibition at which you have exhibited where there was a Government grant for the British section was the Paris Exhibition. The others you mentioned, I think, were all not subsidised by the Government?—There were none subsidised by Government.

2258. Paris is the only one for which a grant of public money was given?—Yes.

2259. In considering whether you will exhibit at an exhibition do you attach much importance to whether there is or is not a Government grant for the representation of British exhibitors?—Of course, I have experience of two or three hundred exhibitions which are carried on at much expense; I have no experience of any other in which there was a Government grant. I think that is indispensable in the case of a great International Exhibition. We do not pay for our space in such exhibitions; we do in others; we often pay £60 to £100 for space at exhibitions.

2260. Looking at it strictly from the point of view of your own business, you have found it worth while to go to these various exhibitions which have not received Government money?—Yes.

2261. You find that on the whole it pays you to do so in the shape of orders directly or indirectly resulting from your exhibit at those exhibitions?—I am afraid I must qualify that answer; there have been a great number of exhibitions of the Earl's Court type. We once exhibited there, but we did not do it under our own name. We exhibited there for the London Hospital, and they made some hundreds of pounds by charging admission to our exhibition, but it would not do our business any good because it was for the general public. You are speaking of a very special trade. It did not do us any good although it cost us a good deal of money.

2262. On the whole it paid you to exhibit at the special exhibitions which you refer to?—It pays us to exhibit at all special exhibitions. I think it would pay us to exhibit at any great international exhibition if it was in any country where we were likely to obtain a demand for our goods; in any Colony it would, but it would not in Germany, and it would not in the United States.

2263. Would it pay you better than pushing your business by your own private methods, employing travellers to go round, and so on?—We have travellers in India, and at the present time in China and Canada. I do not think we should wish to undertake a big exhibition with all this expense every year, but occasionally I think it is a very good thing.

2264. Could you follow that up by saying why? Does it bring you into touch with more possible customers or with other firms?—Yes. You see even in Paris it was a sort of connecting link in obtaining many large orders. If we are fitting up a hospital (I believe at that time there were several in this country that were on the point of being fitted up), we met the surgeons, we will say, at the Manchester Exhibition; they came to see everything that was new; they went to Paris again and they became convinced that our goods were the best, and then we obtained the Grand Prix, so you see it is a connecting link in business. It is often the continual dropping of water that wears away the stone. There was a surgeon there commissioned by the Roumanian Government to buy for a Roumanian hospital the most perfect operation table that he could find in the exhibition. He purchased one of our tables, and we have continuously had small orders from this hospital in Roumania ever since.

2265. I suppose the same result might have come from any specialised exhibition that you have attended abroad, like the one in Berlin?—It might, but I think that these great international exhibitions attract people from all parts of the world, and they expect to meet there with that which is latest and best.

2266. (*Mr. Harris.*) Have you not rather modified your first statement, that you were very doubtful whether exhibiting at Paris had paid you?—The actual cost in Paris was, in figures, £847; the result in actual orders taken at the exhibition was £200. Of course, the direct results were exceedingly small.

2267. When you said at Glasgow you did very well, were you speaking of direct orders?—I was speaking of direct orders.

2268. (*Mr. Algernon Law.*) You mentioned, I think, that you had suffered from copying, or you were afraid you would?—Yes.

2269. That does not deter you from exhibiting?—No.

2270. You think you gain more than you lose?—Yes, at the other exhibitions, but particularly, we will say, at Paris, we were inundated by Germans, who came and saw and questioned and cross-questioned the man in charge. Of course, we know that we use our eyes when we walk about, and sometimes we see something on a bicycle that we think we can attach to a surgical instrument. We do not object to anything a man may gain in that way, but we do not expect to give the details of our manufactures to our rivals. The Germans try very hard to obtain those particulars. Our instructions, which I am sorry to say I have not here, are to treat all such people courteously, but at the same time not to give away our trade secrets if possible. Therefore I say a judicious representative does minimise any such disadvantage.

2271. There has been no serious case of copying, so far as you are aware?—With regard to our goods—and all other firms will tell you the same—you may send an order to Germany taken from our catalogue, and get it executed.

2272. But that does not deter you?—It does not. I would like to say one word, amongst ourselves, my brothers and myself, we always have one answer to that; that is, "Well, we cannot help it; the only thing is to keep our competitors on the run." That is our business experience.

2273. Since your goods were stopped by the tariff of the United States have you made any further effort to push them into the United States?—No. This is some years ago. Personally I have never had any large business in the States. I have had nearly 30 years' business experience for myself. Previous to that I was with another firm who did do a large business with the States, but it fell off in all that class of goods which came under the 45 per cent. duty.

2274. Are the American goods supposed to be fully up to your standard? We have had evidence here of people who have had a 60 per cent. tariff against them, yet their goods were so special and of such good quality that they could compete successfully with the American-made goods?—All those answers must apply to particular trades. I am not trying to push any idea of my own about trade.

Mr. A. W. Down; 7 Feb. 1907.

2275. You have not made any special effort since then to push the trade?—No.

2276. (*Mr. Wilson Fox.*) Do I gather that, owing to the fear of having certain new instruments copied you do not show them?—No, but we avoid it where we can.

2277. Supposing you had a new instrument of a special pattern which other people had not got, would you send that to a large international exhibition?—Yes.

2278. The fear of having your things copied would not prevent you sending your most up-to-date things?—It does not.

2279. If you have a special instrument of great value for surgery, do you not think if the Americans knew of it they would want it, notwithstanding the high tariff; it would be of very great importance to the surgeons out there to use the very finest, best, and most up-to-date instruments?—We do supply a few isolated instruments of that kind. We always have American surgeons here at certain times of the year, who carry back instruments. That is an important branch of the trade, and has been as long as I can remember.

2280. I was rather following up Mr. Law's question as to whether you had given up hopes of pushing goods in America, and had not tried it during the last few years?—It is a question of commercial advantage, and in that case the expense of pushing them would be greater than the results.

2281. You know your own business best. I only want to get your answer?—We do not make an unlimited output.

2282. It must depend upon the results?—With a surgical instrument maker a surgeon gives you an idea and you carry it out. We work matters on the old-fashioned plan that the moment the thing is carried out we say to the medical man: "If you like to describe this thing in the medical papers, we will illustrate it for you," and we send our own draughtsman, and so it gets into the papers. We do not patent it; we never patent a surgical instrument.

2283. I understand you generally to say that you think international exhibitions are valuable to your trade and your particular industry, first of all because an award, if it is a good one, will advertise your goods here, and secondly, because foreigners will see your goods in the glass case which you show at the exhibition, and you will get direct orders from abroad, and increase your export trade. Do I understand those are your motives for showing?—That would depend on what country it was.

2284. I am not talking about a country with such a high tariff as to exclude them?—We should only exhibit where we think it would be to our advantage to do so, to increase our trade abroad as well as here.

2285. Provided there is not too high a tariff?—Yes.

2286. Do I understand that you have to your knowledge increased your export trade through exhibitions?—Exhibitions generally?

2287. Foreign exhibitions?—Yes, but with regard to Paris not to a great extent. I will give you an instance there. I have now, and I have had ever since, some connections in South America, gained in Paris, who were recommended by some of the very surgeons on this jury who said that the English instruments were better than the foreign.

2288. You think you have not only increased your sales at the time, but you have been able to maintain, and perhaps increase, your connection abroad afterwards?—Yes. I would like just to say one thing in regard to that: I have customers who have been continuously buying instruments exhibited at the International Exhibition of London, 1881. Those instruments have found their way into Canada, and for those particular instruments I have had a continuously good trade ever since. I think that is evidence of the value of an international exhibition. They have died out here; they live there.

2289. At all events, you are prepared to go on showing at international exhibitions?—Yes.

2290. Because you think they are a direct benefit to your particular trade?—Yes.

2291. When you spoke about collective exhibitions not lending themselves to your trade, you were, I understand, limiting that principle to your trade. You are not necessarily against collective exhibits as a principle, but you say that that principle does not apply itself to your particular trade?—Of course our trade would be included in a big section; it would not have a section all to itself. I think that collective exhibits would make exhibitors want to throw on to a Government Department what they would not do for themselves.

2292. That is rather another point. I was rather on the point of collective exhibits, as to how far one exhibitor cared to go in with two or three others. I understand from you that where there is very keen competition in trade the exhibitors prefer to paddle their own canoes?—That is exactly so. For instance, you find that enamelled iron goods are something which are sold at every street corner, and some of those goods are used in hospitals. We deal with those that are used at hospitals, among the many other classes of goods. Makers of enamelled iron goods might arrange among themselves after this manner, "We will not touch hospital matters if you will not touch our class of enamelled ware." For a set of manufacturers of that kind a collective exhibit would answer, but for us it would not answer, because we do not want to give our secrets to other men in our trade, and they do not want to give theirs to us.

2293. You prefer to run your own business and try to get the greatest advantage from your own exhibit?—Yes.

2294. If you joined in a collective exhibit, you would be afraid that someone else might benefit by those exhibits?—It would be that, practically.

2295. (*Mr. Algernon Law.*) Why did you not exhibit, say, at the International Exhibition at Liège, and the earlier one at Antwerp?—I went to the Antwerp Exhibition, but we did not exhibit there. That was some years ago. I go to all those exhibitions.

2296. You did not go to Liège?—No, but I was pressed very much.

2297. You did not think it worth while?—No, and sometimes there are other circumstances. I believe in having an efficient representative. There are exhibitions where people take big cases and leave them locked up; there is no one to look after them or to give any information. Those are the exhibitors who complain. When it came to the Liège Exhibition, we did not exhibit because we could not spare the staff.

2298. (*Chairman.*) It was for private reasons?—Yes, reasons of that character.

2299. (*Mr. Algernon Law.*) Do you always leave a man on the premises?—Yes, always at least one man.

2300. Who knows about your goods and can explain them?—Yes; that is the keystone of the whole thing, I believe.

2301. (*Sir Isidore Spielmann.*) You say you do not patent your instruments?—We do not.

2302. Would you not be protected at exhibitions if you did? Would they copy your instruments at these exhibitions as readily if they were patented?—These are general answers to general questions, as a rule; you would have to patent in every country, and the expense of that would be very great in the case of instruments that are changing from day to day, so it is not worth while. Then, also, the medical man does not patent; the idea is the medical man's. We do not do it in our trade. Foreigners do, but Englishmen do not.

Mr. Lucien Serraillier, called and examined.

Mr. L. Serraillier.

2303. (*Chairman.*) You have been on the staff of the British Commissions for the Paris and St. Louis International Exhibitions?—Yes; my connection with the two Commissions covered a period of seven years.

2304. What is your opinion as to their effect upon the manufacturing and exporting trades of this country?—My impression is that they have not any apparent effect.

2305. What is their effect on British art?—I am not in a position to say about that. I should like, if

may, in the first place to qualify my remarks, and say that they only apply to industrial exhibits. I exclude the art section, which is quite a thing apart. In my remarks throughout I also exclude the education section and Government exhibits, such as a collective exhibit of mining statistics, etc.

2306. In regard to their effect on the general commercial relations between the countries you do not think they have any particular effect?—I do not think so.

2307. What particular industries are benefited?—I think it is the small firms and new firms that are benefited by an exhibition, and the firms that are connected with retail industries or small industries. I do not think they have any effect on the industries of the country as a whole; the effect, if any, is on the particular firms that exhibit.

2308. Have you known of any industries adversely affected by exhibitions?—No. I do not think that they would affect any industry adversely.

2309. I understand you do not consider there is any effect upon the general commercial relations, so naturally you would not say that official participation was warranted?—Not if it is intended merely to develop the commercial relations or to develop the export trade.

2310. You consider that equally satisfactory results could be obtained by private enterprise?—I think better results can be obtained by private enterprise, because a firm which has been established some time will know the sources to tap; they will send out their representatives to the countries where they are likely to find buyers, whereas you cannot compel everyone to come to an international exhibition. I am speaking, of course, from the industrial point of view.

2311. Assuming that public money is granted for the organisation of official exhibits, do you consider there should be any special conditions as regards accommodation and facilities offered by the exhibition authorities?—I understand by "the organisation of the official exhibits" you do not mean the organisation of the Government exhibits; you mean the official organisation of the industrial exhibits; is that not so?

2312. Yes?—There is a distinction between the two. If you want adequate representation to show foreign nations what is being done in this country, I think you want a sort of museum of what has been done during, say, the last few years. You have this in the art exhibit, because you there have a selection of representative pictures, and I think that in the case of industrial exhibits you ought to have a similar selection of representative exhibits.

2313. You mean that the Government should do that?—Yes.

2314. There should be an organisation to do it?—I say there should be if you want to have an adequate representation. The same facilities and privileges should be given to industrial exhibits as have hitherto been conferred on art exhibits; such industrial exhibits should then be selected and limited to typical examples. I do not say it is advisable to do that, and that commercial advantages will flow from that. I merely say it is the way of approximating to a more adequate representation of the industries of the country. I look upon the system of collective exhibits as a step in the right direction.

2315. Do you think it would be worth the great expenditure?—No, not as regards industrial exhibits.

2316. You know what are the chief foreign systems; the French and the German. Never mind if you have not studied it, because we have had it from other witnesses?—With regard to the French system, I obtained some information from a conversation with a French gentleman officially connected with the organisation of exhibits when I was in Paris several years ago, and I gathered from him that the French system is really spontaneous; that is, it proceeds from the exhibitor. The French system is in the nature of an independent organised effort of industrials which receives subsequent official sanction. I think that such a system is a better one than the present British system.

2317. I think you have very clear and rather strong ideas about the chief causes of success or failure of the exhibitions that you have been connected with—the late Paris and St. Louis Exhibitions?—Yes, from my experience of the Paris and St. Louis Exhibitions I found that there was a certain apathy to exhibit on the part of manufacturers.

2318. What was the reason of that?—I take it in the first place the tariff question; especially with regard to the St. Louis Exhibition, that was very apparent. The cause of the refusal of exhibitors to participate during the Paris Exhibition was also due to tariff questions; political questions also interfered at the moment. I think the tendency of English firms is against going to the expense of exhibiting. Some of them who have received high awards at previous exhibitions are afraid of not getting these confirmed.

2319. Will you take the reasons you have given in your précis?—They are either too busy to attend to the matter, or too slack, and in that case unwilling to spend the money. I had that experience in connection with the Paris Exhibition.

2320. Did you try to get exhibits for that?—Yes, I was secretary of the Mining and Metallurgical Committee; we were engaged in circularising exhibitors.

2321. You sent out a number of circulars?—Yes.

2322. What percentage of returns did you get as exhibiting?—I could not tell.

2323. Roughly, did you get half?—Nothing like that.

2324. A tenth or one-hundredth?—Something like one per cent.; it was very small. There was an organising committee for the purpose. However, there is not very much to be gained by exhibiting steel ingots and specimens of minerals.

2325. That was the only class in which you took any part?—For the Paris Exhibition.

2326. That was the only class in which you tried to get exhibits for that exhibition?—That was the only group of manufacturers dealt with by the committee of which I was the secretary, but I was on the general staff throughout and naturally in touch with the work of other committees. All the secretaries of committees were members of the staff of the British Commission, and naturally we all knew what happened. The experience of my committee applied pretty generally to all the other committees.

2327. Did the expense of exhibiting make much difference, do you think?—Yes, to some extent; for certain classes of exhibits the expense is very great.

2328. There is also the copyright law, and the danger of exhibits being copied. Did you find that to be a cause?—Yes. We had to get protection from the Government regarding the copyright laws by a Special Order in Council, but even then I think that if a firm has anything new that firm is chary of exhibiting it. Protection against copying is very difficult in each case.

2329. I gather that you prefer the specialist exhibition to the general exhibition?—I do from a business point of view. May I be allowed to explain what I mean by giving you a case in point? I am connected now with an engineering company which is new, and I have sent an exhibit to New Zealand. I have sent it because there is a demand at present for this new kind of construction, because New Zealand is far, and because I have no proper agent there. Therefore I send a small and economical exhibit, with the intention of arousing interest in that particular work; I am also going to exhibit at the Building Trades Exhibition, because that is a specialist exhibition.

2330. Where is that to be held?—At Olympia, in April. An exhibition of that kind is entirely confined to the building trades; nobody goes there for pleasure. You know that people from all parts of the country go there because they want to learn something, and they are nearly all of them possible buyers, therefore it is worth while to exhibit there; but I would not exhibit at an international exhibition—at least not after my company was a few years old and fairly well known.

2331. At your Building Trades Exhibition you will not have many foreign visitors, I suppose?—No, there will not be many foreigners; it is exclusively British.

2332. Do you prefer special exhibitions that are international—there are some, I believe—or do you prefer those that are special in this country?—I would not say that; I think I would favour a specialist exhibition that was international.

2333. Anyhow, you prefer the specialist to the general exhibition?—I think it is more representative. The

Mr. L. Serraillier.

7 Feb. 1907.

development of all industries is such that only specialist exhibitions can cope with the subject, and they are a better means of education to buyers.

2334. You do not attach any importance to the side shows and the usual forms of attraction at exhibitions?—No; I think the people who go to the side shows are not the people who will be likely purchasers. If they go to the side shows they are going on account of the side shows, and would not take very much interest in the industrial side; those that go for the industrial side may possibly also attend the side shows, but they have gone for the industrial side, and you would get them in any case, with or without side shows. May I give you an instance of what I mean by an international and non-specialist exhibition not being representative of a particular industry in a national section? In the St. Louis Exhibition an area of about 14,000 square feet, excluding gangways, was allotted to Great Britain in the agricultural building. There were only nine individual British exhibitors in this department—I mean by "individual exhibitor" an exhibitor who has a stand of his own, not a man who takes part in a collective exhibit—and one of those nine had as much as 10,000 feet allotted to him.

2335. Out of the 14,000?—Yes; that was necessary, because there was no one else to take his place, and the space had to be utilised. That exhibitor was willing to go and was patriotic to that extent, but that is not a representative exhibit.

2336. What firm was that?—The firm of Joseph Baker.

2337. (*Mr. Wilson Fox.*) Are they machinery people?—Yes. The Royal Commission did the best they could under the circumstances.

2338. (*Chairman.*) I am now coming to the Royal Commission, and I think you have already answered that you prefer the French method to the British method?—If my definition of the French method is correct.

2339. The reasons would not be quite the same. I do not think we need go into that. Do you consider that the appointment of a Royal Commission constitutes a satisfactory method of dealing with the organisation and preparation of British exhibits, or if not what alternative machinery would you suggest?—I do not consider that a Royal Commission is quite satisfactory as regards industrial exhibits, because many of the members of the Royal Commission are not directly connected with industry. I think in the St. Louis Exhibition out of about 107 members of committee, including the recurring names—that is to say, counting over again the names of members who are members of several committees—there were only about six who were connected with some industry; from that number of 107 you have to exclude the members of the Art Committee, many of them are artists, and rightly so, and members of the Education Committee who are some of them Government officials.

2340. How would you propose to improve that?—I think that leading industrials should constitute themselves into organising committees of industries of which they are the representatives. Some of the heads of those leading firms might actually be members of these committees.

2341. You think they would agree to that?—I see no reason why not. For instance, take a case in point, Mr. Joseph Baker is not a member of the Agricultural Committee, he should be, even though he may allot himself space; that is the objection that has been raised, that they may favour their own applications, but I do not think that would be so. Names could be suggested by Chambers of Commerce.

2342. You would make it less official and more industrial?—Yes, in regard to the industrial section. A Royal Commission is an attempt to manage a commercial enterprise on official lines, and is, in that respect, an unsatisfactory solution of the problem.

2343. With regard to the expense for each committee of the department of industry, would you let the exhibitors pay for that or would you wish that to be paid out of a Government grant?—I should let the exhibitors pay for that.

2344. Pro rata?—Yes, pro rata to the space occupied by them.

2345. What should the Government do?—I think that when the Government has sufficient indication that interest has been aroused in the country, and that there is likely to be worthy British participation, the Government should appoint some official who would represent the Government from the social point of view, and would be the channel of communication between these various committees and the exhibition authorities of the country where the exhibition is being held: I think that a small grant would cover that.

2346. You would not have such a large grant as you had at these two exhibitions you speak of?—No, I would not; at least, I would not devote them to industrial exhibits; it might be necessary to have a grant for the fine arts and possibly it might be thought worth while to show an educational exhibit. That of course is not commercial, and would require a grant. For the industrial sections I do not think that public money should be spent in direct assistance to exhibitors.

2347. Now as regards pavilions, would you have those expensive pavilions that you have seen at Paris and St. Louis; perhaps you have not considered that matter?—I have not thought of that.

2348. Do you think they are valuable?—Yes, they concentrate attention on the nation; I think they are necessary to that extent. I do not think it is necessary to spend so much money on these as was spent at Paris and St. Louis.

2349. You think they might be sham and not so substantial?—Yes, I believe that the official grant to the French Commissioner-General for his official representation at St. Louis was about £40,000. The British pavilion alone, I think, cost £32,000.

2350. As regards awards, have you any opinion? Do you think they should be continued?—I am inclined to think it would be better to abandon them.

2351. Altogether?—Yes.

2352. Do you think that people would exhibit all the same?—It may be that awards are an inducement, but they are also a deterrent. I think that the country which gives the exhibition is at a tremendous advantage, as compared with the countries who are participating, in the way of jurors; they swamp the others. Take, for instance, St. Louis. There were jurors in the furniture section who were of opinion that a firm should have a Grand Prix because it had a large output. You will find a Grand Prix awarded to a firm which had a large turnout of roll-top desks—so many hundred roll-top desks every year—it got a Grand Prix, whereas firms with an artistic exhibit could get nothing more than that. There is another disadvantage, and that is with regard to exhibits which are *hors concours*. A firm can place itself *hors concours* by getting its representative appointed on the jury, and an award *hors concours* gives one the impression—and I have never been able to get rid of the impression—that it is a higher award than a Grand Prix, which, of course, is not the case. It gives the impression of special recognition.

2353. Whereas it is only an accident?—It may only be an accident. A firm which perhaps fears that it may not get the highest award may arrange to be placed *hors concours* in that way.

2354. (*Mr. Wilson Fox.*) You took part in both the St. Louis and Paris Exhibitions?—Yes.

2355. Did many firms who showed in Paris refuse to show at St. Louis?—I can only speak from general impressions I have.

2356. I do not ask for the number?—I think you will not find very many firms that showed at Paris repeated their exhibit at St. Louis.

2357. Apart from questions of tariff, which, I understand, were raised, could you give any reason at all, or did you hear any reason given, why firms who showed at Paris did not show at St. Louis?—No; I was at St. Louis at the time the invitations were made to the firms, therefore I am not in a position to give any reason other than that general one of the tariff. I was present when the first circulars went out, and came across this general objection to the tariff on the part of firms who were being invited to exhibit; but when I went out to St. Louis it was in April, and the active propaganda took place subsequent to my departure from England.

2358. You cannot answer that of your own knowledge?—No, I cannot.

2359. I understand that you say that firms may be

too busy to go to the trouble of getting up an exhibit?—Yes.

2360. Does that not rather imply that the firms are doing such a good business that it is not necessary for them to embark on this particular form of advertisement. Is that what you suggest?—I did not intend to suggest it that way, but that is so. That is, as far as that particular firm is concerned; it does not exhibit when it is filled up with orders.

2361. It is satisfied with its present means of advertisement?—Yes. I can give you one case in point at the Paris Exhibition. One of the members of the sub-committee with which I was connected was the head of a firm who were asked to exhibit. He refused to exhibit, on the ground that his firm had enough work for two years ahead.

2362. I put this to you—that the leading firms, the firms which are well established and doing a large business, are less likely to show than the firms which are trying to make a reputation?—Yes, any new firm.

2363. You go on to say that the novelty of international exhibitions has worn off. Do you say, carrying that further, it is a mistake to have too many international exhibitions? You mean that those who show may get tired of undertaking the preparation of and embarking upon the expense and taking the trouble of sending exhibits abroad. What limit would you put on these things?—In France these exhibitions occur in cycles of 11 years.

2364. But, taking the Continent generally, and having regard to how far Great Britain should participate in these exhibitions, how many exhibitions do you think that the British trader or manufacturer can stand in a period of five years? Would they stand one every year?—No.

2365. What would you recommend? What is the limit you would put on his endurance?—I should think one every five years would be as much as is desirable for firms who consider it advisable to exhibit.

2366. About one every five years, you think?—Yes.

2367. You think if you went to traders and manufacturers oftener you would find they would be disinclined to produce such good exhibits as if they had them quinquennially. Do you think you would get a better British exhibit if you showed once every five years than if you showed, say, two or three times in every five years? What is your opinion of that?—I should think that it would be better that you should not show too often, and not apply too often.

2368. That would be your experience?—My experience is connected with two exhibitions extending over a period of eight years, and in both cases there was considerable difficulty in getting industrials to exhibit.

2369. Taking those two large exhibitions which you had so much to do with, what opinion did you form of British commercial exhibits compared with foreign commercial exhibits? Do you think the British exhibits were up to the form of the foreign ones or not? How did the case stand?—In some groups the British exhibit was superior, in others it was inferior. For instance, the British chemical exhibit was better than any other nation's, even than America's, which had a very large space.

2370. Was it better than the Germans'?—Yes, I considered it better than the Germans'.

2371. But take the British exhibit generally, would you say you were thoroughly satisfied with it at St. Louis and Paris compared generally with the commercial exhibits of foreign countries? Do you think it made a good show compared with the others?—I do not think the industrial exhibit, as a whole, was as good as the French or the German, but it was not bad; I mean to say relatively.

2372. I am asking you this because in your *précis* you say: "The failure of the British industrial exhibit at the late Paris and St. Louis Exhibitions may be attributed to several causes"; and then you give the causes?—I think in the question that was submitted to me it was put the "failure" or "success." Of the two alternative expressions I selected "failure," because it expresses my views more nearly. Perhaps, however, it is rather a strong word to use, and I suggest instead "comparative failure." It was not a success if you judge the exhibition from the point of view of representative of the state of the industries of the country. I do not think the other nations were particularly successful either in this respect.

2373. There are two points there—the point you have just mentioned, and, further, were the British exhibits better or worse than the foreign exhibits? Were you proud of our exhibits at Paris and St. Louis, or were you ashamed of them?—I was not ashamed of them, compared with the others.

2374. Were you proud of them?—In the chemical section, yes.

2375. That was a very small portion?—That was one of the largest.

2376. It is a very small portion of British industries, is it not?—Yes, it is. If you want me to express what I should have said if an American had inquired: "Is this typical of what is being done in your country?" I should have replied: "It is not."

2377. I was not there, and I wanted to know what your opinion about it was. Taking the existing organisation of the Royal Commission, you think that could be improved upon?—Yes, I think so.

2378. Do you think it worth while for the British Government to go on spending large sums of money like they did at St. Louis and Paris with the existing organisation?—No, I do not.

2379. You would not recommend that?—No, not on the same lines.

2380. In the last paragraph of your *précis* you say: "I do not suggest that the proposed contribution to the expenses by British exhibitors would be acceptable to them, but if they were unwilling to bear their fair share in the undertaking, it would merely prove that an international exhibition is of little value to them from a commercial aspect"?—I should modify that by saying it would merely prove that the international exhibition was considered by them of little value.

2381. Your point is that if the traders themselves do not think it worth while to pay for their own advertisement, much benefit is not likely to accrue to British commerce from the Government stepping in and paying that which the traders do not think it worth their while to do?—Yes, I think it is not desirable.

2382. (*Mr. Algernon Law.*) With regard to your suggestion as to having exhibitions every five years, if you expect traders to participate in them every five years, would not that mean that it was practically continuous? It takes two years to prepare, one year to exhibit, and two years to clear up?—It would be continuous as far as the machinery, but not continuous as far as the exhibitor is concerned So far as he is concerned, it might be 18 months altogether. He might make use of his exhibit, and transfer it to other exhibitions with certain modifications.

2383. You say you formed the impression that the exhibitions had no apparent effect upon the manufacturing and export trade of this country. Have you formed any view what it would have been if there had been no British participation in the Paris and St. Louis Exhibitions?—To give a definite opinion upon that would mean an exhaustive inquiry from all the firms as to what result had accrued from their exhibiting. I do not think that it affects it either way; it merely affects the individual firms who exhibit.

2384. You have not had any information from British exhibitors who have had either advantage or disadvantage from exhibiting at Paris or at St. Louis?—No, I have not.

2385. You have no information; it is only your general impression?—Yes, merely an impression gathered from the tenour of the conversation I have had with firms at different times. I can, however, cite no particular instance from memory. Of course, during the Paris Exhibition some firms told me that they had no benefit by it. I forget their names now. One firm told me they did very well. I can remember the name of that particular firm; that was Seebohm and Dieckstahl.

2386. That was in the course of the exhibition?—At the end of the exhibition.

2387. You have never heard afterwards that they received orders later on?—No.

2388. Not merely sales at the Exhibition? Did you

Mr. L. Serraillier.
7 Feb. 1907.

hear any complaint against the management by the Royal Commission at Paris? We have had it said that there was very often no one connected with the Commission about the place to help the exhibitors to protect their goods; people were wandering through in disorder, and that kind of thing?—Yes; complaints have been made, but it is very difficult to say who is at fault in these matters.

2389. We have had it to-day given in evidence that people are ready to exhibit in spite of the risk of being copied; and I see that the firm with which you are connected are sending exhibits to a special exhibition where they are more likely to be copied by the specialists who exhibit than in a general exhibition?—Our exhibit is patented in New Zealand, for instance, and we are protected by the patent law there.

2390. Any foreigner taking part in it would have opportunities of copying it elsewhere?—We are patented all over the world—at least, whenever it is patentable.

2391. (*Mr. Harris.*) Looking to the general sense of what you have said, do you think it would have done any harm to the trade of the country if Great Britain had stood out of Paris altogether?—No, I do not think it would have done any harm to the trade, but it might have been interpreted by the French Government as an unfriendly act.

2392. I was merely looking at the trade; you do not think it would have done any harm to the mere trade of the country?—I do not think so. My opinion is you do better business by sending people abroad to represent you and to seek the channels through which you can sell your goods.

2393. That touches another question I was going to put to you. You seized the opportunity of an exhibition in New Zealand to send an exhibit there with a view to making your manufacture known there?—Yes.

2394. If you knew there was an opening for trade there, why did you wait for the exhibition particularly, instead of sending your canvassers first?—Because the opening of the exhibition was concurrent with the starting of our business. I mentioned New Zealand intentionally as a good illustration of a case where, in my opinion, it may be advisable to exhibit.

2395. In fact, at the moment that you become aware of an opening, if there is an exhibition you would look upon that as a very good way of making your start?—Yes, in the case of a new firm. Even if the exhibition had occurred a year later than our propaganda I think I would have gone to it, especially as I did it at very little expense. The exhibit consists merely of photographs and samples; it is not an expensive exhibit.

2396. Would what you say apply to any country, or merely to the Colonies?—To any country where I wanted to open up business. To give you an opposite case, I cannot conceive what advantage a big firm like Platt Brothers, the textile people, have in spending £10,000 or £15,000 on an exhibit in the United States to show their textile machinery—an old firm like that, which is well known.

2397. You do not think they may have much the same object that you had, in fact?—They would in a lesser degree have the same object—to mark the company known—but I think the money could be better spent in other ways.

2398. Would you mind explaining why you said that the awards were a deterrent?—I said they might act as a deterrent because of the fear of injustice on the part of the jurors.

2399. That would hardly be a deterrent from exhibiting, would it?—Unless they saw their way to being placed *hors concours* it might; for that reason I think the art exhibits were placed *hors concours* at St. Louis, and the education exhibit was put *hors concours*.

2400. You were going to give an illustration, I think, of an award acting as a deterrent in the case of an individual, were you not?—No, I do not know of any particular case; I cannot call one to mind at this moment.

2401. (*Mr. Malcolm Ramsay.*) You said that in your opinion the British Government should not continue to act on the present system as regards participation in exhibitions. Do I understand you to suggest that at present the Government first makes up its mind whether it is going to participate, and then tries to find whether industrials will come in? Is that one of the points of the present system?—I do not quite follow your question.

2402. I gathered from something you said that you thought the Government made up its mind first as to whether it was going to participate, and then set about finding exhibitors, and that you suggest that the Government should find out whether anybody wished to exhibit before it decided to participate?—That is so.

2403. Does that correctly represent your view?—That correctly represents my view as regards both the Paris and St. Louis Exhibitions. The Government were invited by the French Government to participate, and an appropriation was made for that purpose—a small one, which was increased. Then it circularised exhibitors to persuade them to exhibit. My point is that it should come the other way about.

2404. In fact, there should be a more spontaneous demand on the part of the manufacturers before the Government decides to participate?—Yes.

2405. Do you consider that the management of exhibitions could be facilitated if there were some sort of co-operation among manufacturers, some means of ascertaining the real sense of industrial people as to the benefits of a prospective exhibition?—Yes, I think so.

2406. Do you think, as far as the industrial side is concerned, the Government would be justified in refusing to continue to give grants for participation in exhibitions unless there was some sort of co-operation among the manufacturers?—Yes, I think so. I think you ought to have a better indication of the willingness of the British manufacturer to exhibit at his own expense before you give official sanction.

2407. Your reason for considering that the individual exhibitors should bear the expense is, I suppose, that you object in principle to the subsidising of individual traders on the part of the State?—Yes, I do.

2408. (*Sir Isidore Spielmann.*) I think you were over at St. Louis and made the arrangements with the authorities before the staff of the Royal Commission arrived?—Yes, I acted as representive of the British Commission.

2409. Had you any difficulty with the authorities? Did you find that they gave us the space that was promised, and so forth?—I found that they made promises which they did not keep.

2410. Can you give us any particulars of them?—Yes. The British Commission offered at some expense to supply a low temperature exhibit, which was a scientific exhibit and not a commercial one.

2411. Professor Dewar's discovery?—Yes, and to send a lecturer. That offer was made on the understanding that the American authorities would provide a special building for the purpose—that is to say, a building away from the main buildings, because of the dangers of the liquid air—and I received that promise from the Exhibition authorities.

2412. (*Mr. Algernon Law.*) Was that in writing?—It was a verbal promise, and it was also in writing, but in American writing.

2413. (*Chairman.*) Will you explain what is American writing?—I mean to say, when you come to look at it you could not compel them on the strength of that letter. The promise was denied by the head of the Exhibit Department, the general head of which repudiated the action of his subordinate who had given this promise; there was a good deal of friction at the time, and finally the British Commission had to pay for the building because the exhibit was on its way and everything was arranged. The promise that was given to me was that they were going to erect a special separate building for other purposes, and they would give us part of the space; and it was on the distinct understanding that this space was given to us that this exhibit was sent. As a matter of fact, they quibbled; they said, "Space—we will give you space on the grounds"; but we required covered space, and they said that was not in the letter; that was the way they got out of it; but naturally an exhibit of that kind would be covered. We were given the space, but we had to erect our own building. I can give you another instance. That was in connection with motive power. One of our exhibitors agreed to exhibit conditionally on getting his motive power free of charge, or, if not free of charge (I do not recollect at this moment exactly which it was) at a considerable reducton in price. This concession was promised on con-

dition that it should be kept secret so as to form no precedent for other exhibitors. At the time of settling up, the promise was denied, but as I had this time taken precautions I was able to produce at the proper moment the necessary evidence of the promise, and so we got our own way in the matter.

2414. (*Mr. Algernon Law.*) We did not pay for it?—No, I think that was adjusted.

2415. (*Sir Isidore Spielmann.*) Had you any other difficulty that you would wish the Committee to know of?—With the American authorities?

2416. Yes, the exhibition authorities?—I do not recollect any at this moment. I was not quite prepared for that question.

2417. You are familiar with the installations; you saw all the exhibits installed both at Paris and St. Louis?—Yes.

2418. Do you consider the division of exhibits into groups and departments and shown in different buildings, each nation having space allotted to it in each building, is the most suitable arrangement for a national display?—Before I reply to that question may I mention in reply to your former question another thing which happened with the General Transport Service Company? They came to us when they were unable to locate the position of the exhibits, they got mixed up about the buildings at the time of the installation. They came to me and asked if I would give them some rough indication, as I knew the nature of the exhibits, of where they were to be shown in the various buildings. I said I would give them that information if it would assist them, but I gave it to them on the understanding that I should not be responsible for any error, because until we had the bills of lading I could not tell exactly; but I gave them an indication sufficient for them. They made mistakes; they did not follow my instructions; as a matter of fact they sent the cases to the wrong buildings, and then sent us an extra bill for the re-transport from the wrong building to the right one.

2419. (*Mr. Algernon Law.*) Did we pay?—No, we won that.

2420. (*Sir Isidore Spielmann.*) Now will you answer my previous question?—I do not think the sub-division into departments makes an effective national display. At Paris they divided exhibits into classes which were sub-divisions of departments and groups. There were departments, groups and classes. They abandoned the sub-division of the classes as being too minute, and adhered to groups, and the groups were shown in one building, which constituted the department. The result is that a nation is distributed all over the ground, and is in a way dwarfed by the country which is giving the exhibition, which always has about 40 per cent. of the space. Also you have at the outset to state the amount of space you want, and to arrange for it, and it may happen that some of the exhibitors drop out, and you do not desire the space or cannot fill it adequately, or others may come in, and you may require more space than you originally stipulated for. There is no elasticity in arrangements of that kind. If you have one national space you can make good the deficiency of one department by a more imposing exhibit in another department, and from a national point of view I think it is better to have it all together. In fact, to have a selection of typical exhibits, a sort of museum.

Mr. L. Serraillier.
7 Feb. 1907.

2421. You have said that you think that Royal Commissions are unsatisfactory for the purpose of organising the British sections. Would you suggest that the London Chamber of Commerce should organise British sections?—No, I would not.

2422. What alternative would you suggest? How is it to be done?—To organise an industrial exhibit?

2423. To undertake the formation of an entire British section?—As regards the industrial section I would have leading manufacturers, representative men, form themselves into committees.

2424. But how are they to be brought together?—They would meet at some central place, England is a small place, they can travel very quickly from one part of the country to another; you might have some from Bradford, some from Leeds, and so on.

2425. Do you suggest that that should be done under a Government Department?—No.

2426. Who is to take the direction?—I say that these committees are each independent for each group of manufacturers, each class of manufacturers. Let us take, for instance, the woollen trade, you might have a committee for that.

2427. Who would form the committee?—They would form themselves from the Chambers of Commerce or from industrials who are interested in exhibitions. When you find that people are willing to exhibit, that there is a desire on their part to do so, then you can appoint your Commissioner or official, who will be the central authority to whom to apply. He would be the channel of communication with the foreign country.

2428. (*Chairman.*) Surely somebody must start the thing?—You might have a permanent official, say, of the Board of Trade, who would be entrusted with the task of circularising the manufacturers to acquaint them with the fact that the exhibition was to be held, but whose functions at the time would be strictly limited to making known the exhibition and not to proselytising.

2429. (*Sir Isidore Spielmann.*) If you were an industrial firm would you participate in an exhibition after your experience?—I think, as I said, I would if I were a small firm and wanted to get known. I would, if it were not too expensive, participate in an international exhibition, but if I were an old-established firm I would not. I would also participate in special exhibitions.

2430. (*Chairman.*) How did Messrs. Baker come to have 9,000 feet out of the 14,000; did they ask for it?—They had a very large exhibit, an immense exhibit.

2431. Had they any difficulty in getting that 9,000 feet?—No, I do not think so, because there was nobody else to fill it.

The Lord Justice Fletcher Moulton, F.R.S., called and examined.

2432. Would you kindly say what your experience with exhibitions has been?—I was a member of the Council of the Society of Arts during the years when it was concerned with the Chicago Exhibition. You will remember that the British Commission for the Chicago Exhibition was the Council of the Society of Arts.

2433. They managed that exhibition?—Yes. As one of the Commission I went out to the exhibition, and stayed there for three weeks in charge.

2434. You got to know that thoroughly?—Yes. Then in 1900 I was one of the Superior Jury at the Paris Exhibition, and in connection therewith I had before me all the disputes or difficulties that arose in giving the prizes. They were not abnormally numerous, for I think the French Bureau treated all foreign exhibitors very well. But they were considerable in number and sometimes rather difficult.

2435. Yours was the court of appeal practically from all the other juries?—Yes.

2436. Are there any other exhibitions with which you have had to deal?—No.

Lord Justice F. Moulton, F.R.S.

2437. Have you anything you would like to say about the effect of exhibitions upon the manufacturing and exporting trades of this country, British arts and the general commercial relations between the countries concerned?—My opinion with regard to that subject must be looked upon as the opinion of a member of the public rather than as coming from the side of the exhibitors, but the impression that has been made upon my mind by both these exhibitions, as well as by my attendance at prior exhibitions like those that were held in France in 1889 and 1878, is that an important international exhibition is an opportunity that no country in the position of Great Britain ought to miss of keeping up its international, and more especially its commercial prestige in the eyes of the world. I do not think that the cost to which it is put is seriously to be considered as compared with the injury it will do its status in the world by making a mean appearance on occasions of that kind; but I wish it to be under-

Lord Justice F. Moulton, F.R.S.

7 Feb. 1907.

stood that my remarks apply only to what I call important international exhibitions. A town in starting an exhibition may have for its main object the bringing to that town of a large number of visitors and raising the status and importance of the town in the eyes of the world. I do not think that a great nation ought lightly to fall in with a plan of that kind, but in the case of truly international exhibitions, where the effort is a national one, we ought always to be well represented.

2438. I gather you prefer to make your observations from a general point of view rather than from the point of view of particular industries. If you can, will you tell us about the particular industries that have chiefly benefited by exhibitions?—I think that it would be difficult to name any class of industry that would not be benefited by appearing well at these great exhibitions. The very miscellaneous character of the exhibits at the Paris Exhibition in 1900 which came from Great Britain gave me a good opportunity of forming an opinion upon the points. They were of the most varied kind, from an effort on the part of a well-known English firm in the strong-room line, where the door of a strong room was, I believe, capable of withstanding a shot from a fairly powerful modern gun, down to such things as exhibits of mustard and starch from our English firms. I think that in a big exhibition the people who attend are of so varied a character that there is a fair chance of exhibits of real excellence, skilfully arranged, making an impression in almost all industries. I may say that my experience in that exhibition led me to think that very great care is exercised by the juries in examining all the exhibits, and that the prizes that are given, (always allowing for a certain bias in favour of well-known names) do really indicate excellence, and are recognised as so doing.

2439. In your opinion do you think there is much to be said *per contra*, do you know of interests adversely affected in any particular industries?—That is a little difficult to answer. I certainly think that the effect of an exhibition in a foreign country is very often to wake up that country and to educate it commercially to an important extent. So far, therefore, as tending to make efficient rivals, I think an exhibition may operate unfavourably in some industries if those industries are not sufficiently progressive to keep ahead of the world. I dare say that if an industry is sluggish and maintains its position mainly by the fact that it inherits a good tradition, international exhibitions may make its competitors more formidable, but I do not think that an exhibition does any injury to industries that are themselves active.

2440. In another and more direct way do you think injury has resulted from copying the exhibits at exhibitions; does that come within your knowledge?—That is what I was thinking of in giving my last answer. I think the new models, the better methods that are put before the world in these exhibits, do educate the manufacturers that see them, particularly persons directly concerned with the trade; but, on the other hand, any marked superiority that is evidenced by the exhibits has a direct effect on the customers. I think that is probably much more valuable than the indirect assistance that is given to their rivals. Moreover, I do not believe that any industry can permanently keep its place simply by trusting to its excellent productions not being copied. The very fact that it seeks success means that it is distributing its best articles all over the world, and therefore exposing itself to the danger of being copied, and in an exhibition I think it exposes itself to that danger in the most favourable way for itself, because it is under circumstances where it is likely to reap a good return in the way of customers.

2441. That being so, do you think that his Majesty's Government is warranted in giving grants to organise British exhibits for the future, or do you think that private enterprise should be relied upon?—I think that the Government ought to take this in hand for two reasons: first, that it is of great importance to the country that it should be done; and, secondly, that it is a serious injury to the country if it is done badly, and although I think that in carrying it out Government must to a large extent act through private persons, I also think that the authority which Government gives by being the head of the organisation greatly strengthens the hands of those who wish to do it well. Among other things it puts them into a stronger position to select and reject. I do not think that any private organisation will in the long run attain so high an excellence as an organisation in which not only the nominal head, but to a certain extent the effective head, has the authority of Government.

2442. You have had experience of both. At Chicago you say it was mainly the Society of Arts Commission and in Paris it was the direct Royal Commission?—It was so. Of course, the Society of Arts had the support of Government, but the council of the Society of Arts was at that time, and I believe still is, a very exceptional body, and if it was part of its acknowledged duties to attend to exhibitions, I am not quite sure that influences would not be brought to bear so as to alter to some extent the character of the members of that council. They are now chosen entirely on account of their knowledge and practical interest in arts and sciences, and, as I said, they are a very exceptional body. Such a body can be used once for a purpose so different without altering, or running the risk of altering, its constitution, but I doubt very much whether you could calculate on its remaining the same if the management of international exhibitions was one of its recognised functions.

2443. I gather you rather prefer the direct Royal Commission with Government control?—I think it ought to be the central authority.

2444. Assuming that is so, and that public money is to be granted, would you make it a condition that there should be plenty of people coming forward to exhibit before the Government agrees to have a Commission or advance money?—I think that the Government acting by itself is helpless; it is incapable of getting together a good exhibit unless it excites a large amount of public enthusiasm and gets a large amount of public support, and I do not think that the official element can do this. The official element should guide and organise the efforts of the individual persons who assist, and it should have power of control, but I do not think that official action by itself is at all sufficient or at all of the nature to make a successful exhibit. It is far too formal; its tendency is to do everything in a cut and dried fashion. There is very little initiative in it, and if it is too prominent in the working of the Commission, I think you will find that the response will generally be poor. It has a most important function in controlling the organisation and giving it authority, but the very first thing it should do is to get the volunteers.

2445. To get commercial members?—Yes.

2446. Did you in Paris or Chicago come across the German and the French methods of organisation of these Commissions at all?—I came across the German and French exhibits, and they were very admirable indeed.

2447. But not the methods?—No, I had nothing to do with the methods. Germany has taken the view that it is a matter of national importance that it should maintain its prestige at these exhibitions. German officialdom would work better, I think, than English officials would, and at the same time I think that Germany has no difficulty whatever in getting abundant support from the private manufacturers. It is a country that is rising commercially and very eager to rise, whereas the tendency of the English commercial community is that it is rather too much inclined to be satisfied with what is, and is not very eager to do anything that it thinks will produce innovations.

2448. You do not think in this country the German methods of strict organisation and choice by Government officials would be liked?—I am quite sure it would fail. Ultimately the effect of joining in an exhibition is that private individuals have to make great sacrifices pecuniarily, I will not say without hope of return, but certainly to a large extent for the purpose of the credit and reputation of their country. You would not get men to make those sacrifices in England if the matter was done in a strictly official way.

2449. You do not suppose that the State or the Royal Commission should pay all the expenses of an exhibitor—that is, for the freight of his goods, for space, and so on?—I do not think it should, because if it did the chance of an invaluable advertisement being obtained gratis would lead to efforts being made in all possible directions to get particular firms placed among those chosen to exhibit; and what is more, many of the most effective exhibits have been furnished by rising firms who have thus, by the excellence of their work, stepped into the rank of acknowledged firms. It would be quite impossible for any official organisation to ascer-

tain the existence of, or the merits of, firms of that kind not widely known; they would be almost compelled to take commercial reputation as it exists; therefore I do not think that it is advisable to make exhibits dependent upon Government so far as the expense of the exhibits is concerned. On the other hand, I think that the expense of the machinery of getting together the exhibits, and perhaps in certain cases the expenses necessarily associated with the arrangement of the exhibit, might well and safely be paid by Government. I will give you an example of this. Take the case of art. I think that England has gained as much by the art exhibits as by any other part of the British exhibits in these exhibitions. There must necessarily be expenses in carrying the pictures and other works of art and insuring them. Expenses of that type might judiciously be borne by the Government. On the other hand, take the case of an enterprising firm that fixes up, we will say, a model of its works, or sends over some big piece of machinery which is a *tour de force*, and which it wishes the world to look at. It would be impossible for the Government to pay for that, because it could not allow a like privilege to everybody, and it would be most invidious if it selected those to whom it should allow it; besides which, the financial burden would be too great.

2450. There is another expense I should like to ask you about, that is the large pavilions which we have had at some of the last exhibitions; at Paris I dare say you remember the pavilion that was there. Do you think that is a *sine quâ non* or a desirable thing to have at exhibitions at a great expense?—I do not think any money was better spent than on the English Pavilion in 1900, or on Victoria House in the Chicago Exhibition. They were objects of great admiration, and they gave a *cachet* to the total British exhibits which, I think, was obtained very economically; but of course in all these matters you cannot lay down a general principle, because the fact that they have been successful in the past, by reason of being so striking and novel, may be a good reason why you should not follow on the same lines the next time. I ought to say that in my opinion the ideal machinery for international exhibitions is one where the experience of the past is preserved and utilised, but the effort is recognised as a new one, which is to be guided by its special circumstances, and very largely influenced in its form by those who come fresh to take part in that particular exhibition. What you want to keep from the previous exhibitions is not a hard and fast method of forming your exhibits, but the experience of how best to carry out what you determine on.

2451. That is very interesting; you speak of the experience of the past being preserved; in that did you allude to the desirability of keeping continuity of organisation, that you should have a small department, or two or three people?—Yes, continuity of organisation so that the experience acquired should be preserved and utilised, and that you may not waste valuable time in fumbling about seeing what is the best way to begin. In anything that is necessarily so elaborate as an exhibition, although the actual appearance of the exhibits may be as different as possible, there is underneath the surface a vast amount of business in bringing it about which must have a permanent method if it is to be done well. For preserving the memory of the permanent method I think it is most important there should be an organisation that is kept on from one exhibition to the next. Of course, it will be to a certain extent the drudge and not the master of the next one; it will preserve the tradition of how effectively and quickly to carry out whatever is proposed to be done, but it does not at all follow that this organisation will consist of people who will take a prominent part in connection with the new exhibition, although they will take the labouring oar in carrying it out. It is so important that each exhibition should have a freshness and individuality.

2452. You were on the superior jury of awards. Are you satisfied with the present system of awards, or would you modify it or abolish awards altogether, as has been suggested by one or two of our witnesses?—I should leave it as it is at present. I think that no good exhibit gets overlooked. It is too much to expect from any body of jurors that they should not be to a certain extent overawed by a well-known name, and therefore a great firm may get awards a little beyond its merit, but on the whole I think that the system of awards is extremely valuable; and I think without this power of getting recognition, of getting distinction by the excellence of their exhibits, you would find the interest in exhibitions on the part of exhibitors fall off very much. I think the jurors try to be fair, with the one exception, that they rather lean towards taking the view—and it is not at all an unreasonable view—that there are some firms whom it would be a distinct censure to pass over. I remember a firm coming to me and pointing out that they had only got the gold medal and they wanted a *diplôme d'honneur*. They simply said, "We cannot afford to have a gold medal; we have been the head of the trade for so many years, and we cannot take an award which is not the highest."

Lord Justice F. Moulton, F.R.S.

7 Feb. 1907.

2453. What did you do?—I am very glad to say that I was able to get them the *diplôme d'honneur*. I went through their exhibit very carefully, and I saw the head of the French Bureau and pointed out that in point of excellence they had entirely kept up their position, and that they really merited it. There was a good deal of opposition, because the judges had given the full number of *diplômes d'honneur* in that class that they had intended to give, but the case was a good one and they gave it. That illustrates what I mean, that there are some firms to pass over whom would be almost a censure.

2454. Therefore it is rather difficult for new firms to get proper recognition?—No, they get adequate recognition, but I think the old firms get a little over-recognition, that is the danger; otherwise the awards are given fairly. I think there are very few awards that ought to be given that are not. The error rather is that more awards are given than strictly need be.

2455. (*Sir Isidore Spielmann.*) You said just now that a firm wanted the *diplôme d'honneur* because they could not afford to take a gold medal, and the reason they had not had it was, I think, because the number of *diplômes d'honneur* which the jurors had intended to apportion had already been allotted?—Yes.

2456. Is that not rather an unfair way of dealing with the awards? This firm may have been entitled to the *diplôme d'honneur*, but simply because the jury had allotted the number at their disposal that they were giving, this firm had to put up with a less good award?—I think that the jury went on this principle: a *diplôme d'honneur* must be an exceptional thing, therefore we ought not to give more than, we will say, six. I think it was a genuine error that the firm in question were not put among that six. The exhibit was of a character that was a somewhat modest one—it turned more on the quality of the things than on anything that was very striking to the eye—and when I put to them plainly that they ought to have included that exhibit in the first six, the view that the jury took was, "We may not take away any *diplôme d'honneur*, but as you have shown that there is a mistake, and that this ought to be among the first six, we will give an extra one." I do not think that was unfair, because you are justified in restricting the higher awards to a small number, because you mean them to point to an excellence that is far beyond the average of the trade, and of course you cannot have everybody far beyond the average.

2457. Are you of opinion that the Government grants to these large international exhibitions are sufficient?—The one to the French Exhibition was made sufficient in the way that it was very sparingly applied, but I confess that I think it might with advantage have been more liberally dealt with. I think there is a tendency to starve them.

2458. I do not remember how it was at Chicago, but at Paris and at St. Louis comparatively small grants were at first given, and then, by a great deal of effort those grants were subsequently increased?—If the Government were to take the view that I have enunciated they would have to increase their grants considerably; it would amount to accepting this as a department of their work, and as they would have accepted a greater responsibility than they have done in the past I should expect them to increase their grants, though not to a larger extent than would be necessary to defray the cost of organisation, and such portions of the necessary expenses as it was thought advisable from time to time to undertake. That would, however, amount to considerably more than they have generally given.

2459. May I ask your view as to collective exhibits; do you approve of firms exhibiting collectively?—I think that the Commission ought to be delighted when members put their private interests in the background sufficiently to unite to make an important national

Lord Justice F. Moulton, F.R.S.

7 Feb. 1907.

collective exhibit, but I should leave that to the spontaneous consent of the trade. It would be going too far to impose the condition that the exhibits must be collective; it would tend to stop a large number of firms from taking part in the exhibition, but I think the Commission ought to encourage in every way an exhibit which shows the status of the national industry rather than particular work of a certain firm.

2460. And in the event of collective exhibits being formed by the Commission. I suppose the expenses incurred in forming them would have to come out of the grant?—Certainly, I think that those would be fairly met and wisely met by Government; and it would, of course, have a correspondingly larger authority to regulate those exhibits.

2461. On the whole, I think you say you consider the interests of British exhibitors are well protected by the Royal Commission?—Yes. My idea is a Royal Commission, availing itself of the nucleus of permanent officials of which I have spoken, but associating with itself, either as members of the Commission or as advisory and executive bodies, private individuals in the various trades.

2462. Those exhibitions which have not been run by Royal Commissions, especially the minor exhibitions, are usually undertaken by the London Chamber of Commerce; may I ask your opinion of the London Chamber of Commerce undertaking such work?—I think that the Chambers of Commerce are far too loose aggregates for serious work of this kind; a man can get a very considerable position in a Chamber of Commerce simply because he chooses to take the time to attend, and there is not enough serious work done by the Chambers of Commerce to make the best men give adequate time to them. I should not accept, if I were advising a Royal Commission, the co-operation of such bodies as such. The Commission might get their advice perhaps on special points, but they should associate themselves directly with persons specially selected for their fitness, who will give their time and their influence and their authority to assist the exhibit.

2463. I asked you the question because we hear of a Brussels Exhibition in 1910 which is now in process of being organised. It is in its first stages. We hear that the London Chamber of Commerce has undertaken to organise the British Section for that. How the London Chamber of Commerce came to be invited I do not know. May I ask your opinion whether you think it is advisable that British interests should be left in their hands?—I think it is extremely inadvisable. There may be one or two Chambers of Commerce that take their work so seriously that you have, as you have in municipal bodies, persons whose time is valuable and whose experience is great giving serious work regularly to their duties in connection with such Chambers of Commerce, but that is not typical of English Chambers of Commerce. These Chambers have been brought into existence by a process of imitation of Chambers of Commerce that exist abroad. They are a new introduction, and they have not got hold of the commercial community sufficiently to make them suitable bodies for serious work of this kind.

2464. (*Mr. Malcolm Ramsay.*) If I understand rightly, you advocate the expenditure of public money on participation in exhibitions mainly on the ground of the national advertisement?—Yes, I think an advertisement is national that aids the national industry, and that is made up of the totality of the interests of the firms in the country.

2465. You are thinking of the collective point of view mainly?—I am.

2466. Would you say that such expenditure, so far as it represents the subsidising of an individual firm, is not quite so legitimate?—I think the right way of subsidising the individual firm is by bearing a certain class of necessary expenditure. I do not think you ought to subsidise the individual firm (apart from exceptional cases) in a way which would influence its exhibits. It ought itself to bear the cost of the choice of its exhibits, except so far as Government facilitates it by bearing certain definite necessary expenses.

2467. Is it your experience, or your opinion, that the majority of manufacturers who exhibit are induced to do so from patriotic motives rather than from consideration of the direct benefit which will accrue to them?—I think that both types of motive are present, and effectively present. I do think that when they are properly approached, the desire not only to increase the renown of the firm, but also to make England show up well, influences them.

2468. I understand you would not think it fair to the exhibitors to ask them to pay, for example, a *pro-rata* share of the organisation expenses?—I do not think it would be wise. It would stunt the exhibit, and I think the money that would be laid out in that way by the Government would be amply repaid by the general gain to the national industries.

2469. Turning to another point, you are quite clear that the money which has been given lately—for instance, taking the grants to Paris, which was over £100,000, and to St. Louis—are insufficient?—If I am right, the administration of that £100,000 was so careful that it was not all spent.

2470. I think they spent £98,000 or £99,000?—I thought £30,000 came back.

2471. Something like that; I think the grant was £125,000?—I do not know enough of the necessary expenses of an exhibition to say whether any particular figure is or is not enough, but I do not think that the assistance that was given to the English exhibitors at the Paris Exhibition exceeded on the side of liberality.

2472. How often, in your opinion, should the Government participate?—That ought to be very carefully considered. I should not fix it by number of years, but I should fix it by the gravity of the occasion. That is a matter that the Government must decide, and it should decide it on the principle that I have hinted at—that when there is a great international effort England should appear well.

2473. Do you consider that the attraction of exhibitions grows stale by repetition?—No, I do not. If they are made too common no doubt the attraction will fall off. Before 1900 the last great effort I think was the Chicago one, and the one of 1889.

2474. We did not participate officially in 1889, I think?—I do not think we did. I do not think that these international exhibitions have been too frequent. You must remember that the St. Louis Exhibition was an exhibition in America, and you must take the interval between the St. Louis and the one before it so far as America is concerned—something like 13 years—and an exhibition of that kind every 13 years would not make them lose their attraction. I believe the attendance at the St. Louis Exhibition showed that it did not lose its attraction. Is that not so?

2475. I was thinking rather of the financial burden which frequent participation might involve on the tax-payer?—I think that the too frequent participation will be checked by the principle that it must be a serious international effort.

2476. (*Mr. Harris.*) Reverting for one moment to the case you mentioned, of a firm not being satisfied with a gold medal, do you think there is any danger that in similar circumstances a firm, we will say a foreign firm who had a poor exhibit, might bully the jury into giving them a higher award on the ground of their general reputation?—No jurors are perfect, but I think the awards were given fairly in the 1900 Exhibition, and I must say that the jurors took immense pains about giving them. The French probably had somewhat more awards than they ought to have had, but I do not think the foreigners had any less than they merited. There was no doubt a certain liberality towards the French exhibitors, who certainly spent immense sums of money and made most remarkable and attractive exhibits. The worst criticism that could with justice be made is that there was perhaps an undue liberality towards the French, but no lack of liberality towards the foreigners.

2477. Would you not say that that undue liberality towards the nation where the exhibition was held was damaging to the prestige or the trade of the others?—No. It is only what must naturally occur in such circumstances, and I do not think that it would do any damage.

2478. You would say that generally that is your opinion as regards all exhibitions of that class, in America as well—St. Louis or Chicago, we will say?—I do not know about St. Louis, but I think it was so at Chicago, and that in the great exhibitions I should expect it to be so. I have no experience of the smaller exhibitions. I do not know that public opinion would be equally strong or that the people from whom

the juries would be drawn would be of equally high class in the little exhibitions—but in the big ones I should expect it, and I do not think you will find that I should be disappointed.

2479. (*Mr. Algernon Law.*) There seems to be a great reluctance on the part of great British firms to take part in international exhibitions; the result would seem to be that there was not an adequate representation of this country. Do you think, under those circumstances, we ought to embark in a participation in an international exhibition?—That is because the participation has been organised in a somewhat scratch manner. I think if it was taken in time, and there was a Government countenance to it, and yet organised private work in bringing it about, the reluctance or the disinclination you speak of would be very much less felt.

2480. In some cases the expense to which the exhibitors have been put is something enormous; in one case we know of £3,000 having been spent, and the exhibitor found no commercial result whatever?—What sort of trade was it?

2481. Locomotives?—That is just the type of exhibit that was in my mind when I was answering the question as to whether Government should defray the expense of an exhibit; there you are fishing for whales, and if you secure orders they are orders bringing in very, very large sums, and you can afford to spend considerable sums on your bait even though you sometimes have a blank day at fishing.

2482. So that for that a great length of time is required, and you think the Government ought to decide at an early stage whether they intend to take part or not, in order to prepare the way beforehand?—Yes. If, when the Government thought the exhibition of sufficient importance, there was at a sufficiently early stage an official organisation put to work to ascertain what support they could get in the way of exhibits from private exhibitors or from the collective trades, and there was an assurance that by that means the applications for space would be made soon enough, and with a definite idea of what the extent of the exhibit would be, it would make people think much more seriously of taking part.

2483. (*Mr. Wilson Fox.*) Following up that line of argument, the difficulty one has heard from the witnesses about a large representative commercial exhibit is this: that some firms have no interest whatsoever in showing at a foreign exhibition; they do not want to push an export trade, and they are sufficiently advertised here. It is the difficulty of getting the class of firm to exhibit which would be essential perhaps if the Government wished to have a really representative commercial exhibit, which has been presented to us. If the Government do not pay any of their direct expenses (I am not at all suggesting they should) it has been put to us it is extremely difficult to have a representative exhibit of that class of firm?—I think that Government should contemplate that there are certain things which are important in an almost purely national way, and that in that case a large proportion, or even the total, of the expenses of the exhibit might be borne by Government. But that should be the exception. It should be, because the exhibit was arranged for purely national reasons. One might imagine an exhibit of the minerals of the country which would not bear at all upon the personal interests of any private firms, but it might be both valuable and interesting as showing the state of science of the country, and might also be of great geological and mineralogical interest to the general scientific world. In a case like that I think that Government might very well bear the expense. Take another case: I remember at the 1900 exhibition all the apparatus which Ampere and other early electricians had used in demonstrating the great laws of electricity, the original instruments, were there. I rather think in the English exhibit the original Newtonian telescope, the instruments used by Faraday, the instruments by which he discovered induction by electricity, were shown on account of their very great historical interest. Of course exhibits of that kind might well be at the expense of Government, but it should not be the rule.

Lord Justice F. Moulton, F.R.S.
7 Feb. 1907.

2484. I was rather thinking to take two trades like the textile trade on one side and the glass and china trade on the other. Say Messrs. Doulton sent a very attractive exhibit. A large number of those things may be sold directly there. They are attractive, and they get a good many orders, but textiles are not so attractive to look at, and they are not likely to get many direct orders and not many indirect orders?—I conclude you are not in the textile industry, because you will find that people will stand outside a textile exhibit and say, "That is a beautiful cloth." To the eye of the expert a number of these exhibits are really very attractive.

2485. I can understand there are attractive textiles, but I can understand there are very unattractive textiles, or, at least, textiles which are not so attractive as the china and glass, but if the Government wanted to get up a big representative textile exhibit it has been found hitherto that the large textile people have not shown very largely?—You mean that Horrocks' long cloth would not make an exhibit. If there are cases where they are desirous of it, it is possible that Government might go some way to meet industries of that kind. I think the grant ought to be large enough for them to do it, but these cases ought to be by way of exception.

2486. You rather crystallised what was in our minds when you said a textile exhibit would be of interest to experts. My point is that Doulton's exhibit would be interesting to all the world?—There is no doubt that an exhibit like Doulton's ought to be much more completely at the expense of the exhibiting firm than one which was less for their private purpose and more for national purposes.

2487. (*Chairman.*) Is there anything you would like to add?—No.

NINTH DAY.

Thursday, 14*th February* 1907.

PRESENT:

Sir Alfred E. Bateman, K.C.M.G. (*Chairman.*)
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G.
Mr. Malcolm Ramsay, C.B.
Sir Isidore Spielmann.

Mr. Walter Mappin and Mr. Robert James Gibson, called; and Examined.

2488. (*Chairman.*) (*To Mr. Mappin.*) I understand you are a director of the firm of Mappin and Webb, who are, of course, very well known as jewellers, silversmiths, and so on?—(*Mr. Mappin.*) Yes; but I have asked Mr. Gibson to accompany me, as he has had personal experience of exhibition work, and I thought perhaps he would be better able to answer many of your questions.

Mr. W. Mappin and Mr. R. J. Gibson.
14 Feb. 1907.

2489. (*To Mr. Gibson.*) I understand that you are also a director of the firm of Mappin and Webb?—(*Mr. Gibson.*) Yes.

Mr. W. Mappin and Mr. R. J. Gibson.

14 Feb. 1907.

2490. I think your firm has exhibited at several great international exhibitions?—Yes. We have exhibited at Paris and Chicago, and we exhibited also in the Military Exhibition, which would not come under the head of international exhibitions, I suppose. It is in the capacity of a representative of Mappin and Webb that I am now speaking, but indirectly I was connected with the previous Paris Exhibition.

2491. That is, you have been connected both with the Paris Exhibition of 1889, and with the Paris Exhibition of 1900?—Yes.

2492. Your firm has exhibited silverware, electroplate, cutlery, and so on?—Yes. Amongst our exhibits have been dressing bags, leather goods, and jewellery.

4291. I understand that you have formed connexions with foreign countries, which you could attribute to your goods having been exhibited at those exhibitions?—Yes. We have come in contact with foreigners whom I do not think we would have come in contact with had we not exhibited, and they have remained as customers for some little time afterwards.

2494. Have you ever experienced any disadvantage from exhibiting, either by having your goods copied, or in any other way?—It is difficult to answer that question. I daresay our goods have been copied—that is only natural. If there is any improvement that we see in other sections we naturally copy them, and I daresay the same thing has been done to us.

2495. But you do not know that you have suffered any damage by it?—I do not think we have.

2496. Do you consider that any value has been attached to the awards which you have got from exhibitions?—Yes, I do. I consider that the public think a great deal of awards that have been granted at international exhibitions. You see, you are in competition with all the best manufacturers of your country, and naturally, if you have an award of merit, it only goes to show that you are first in the field in that line of manufacture in which you get the award.

2497. Have you ever been induced to buy from the British and foreign manufacturers through seeing their goods at the exhibition?—Yes, we have.

2498. Can you give us any special points in which you have derived instruction or knowledge from visiting exhibitions in connection with either manufactures or machinery?—These international exhibitions give us the opportunity of seeing the various improvements that have occurred in the past ten years—they are generally held, as you know, every ten years. They give one a chance of improving one's own machinery, and one's own mode of manufacture.

2499. You have not refrained from exhibiting since you have begun, have you?—No, we have not—that is, not in connection with international exhibitions.

2500. But I understand that you find that the expense of exhibiting is heavy?—Very much so. There do not seem to be any facilities thrown in the way of the English exhibitor to reduce or to minimise the cost of exhibiting.

2501. Are you referring now to the cost of space?—The cost of space, I suppose, is more or less governed by the country in which the exhibition is being held. I mean that there were no facilities—or at least we have not experienced them—from the British commissioners in the way of decorating and making a uniform exhibit which should represent England. Each of the exhibitors seemed to have all the responsibility thrown on their own shoulders, and, to put it roughly, they had to get out of it as best they could.

2502. You had to decorate your own exhibit and your own court, in fact?—Yes, from start to finish. In addition to that the assistance that was rendered from the Commission was not by any means up to date. Instead of the Commissioners sending to us messengers, and giving us the assistance we required in the way of admissions, and in reference to the queries that were raised by the French authorities especially, we had to run after the Commissioners and await their good time to get out of our difficulties.

2503. Are you referring now to the Paris Exhibition of 1900?—Yes. To give you an instance, as an exhibitor I did not get my pass to the exhibition, except a temporary one, until a fortnight after the exhibition had been opened; and I was obliged by this temporary pass to go out by the same gate, and if I wanted to go out at any other point of the exhibition I had to answer all sorts of questions, and very possibly could not get out there.

2504. You did not have the proper pass, in fact?—No. In the American section everything seemed to work very smoothly. If they wanted anything they telephoned to the Commissioner, there was a messenger boy sent down, and it was the Commissioner's messenger-boys who did the work for the exhibitors.

2505. Did you attribute that to want of organisation, or to any other reason?—I think that would be due to want of organisation; I could not attribute it to anything else.

2506. You found the English organisation, I suppose, willing to help you?—I think it was like the old saying, "The spirit was willing, but the flesh was weak." I do not know exactly whether they were overtaxed with work, or whether they had the proper assistance at their hands, but the fact remains that we did not receive it.

2507. Did you ever see the British Commissioner, Sir Herbert Jekyll?—Yes; but it was with difficulty that one could see him.

2508. I am sure you found him helpful when you saw him?—I am sorry to say I did not receive very much assistance from Colonel Jekyll. His assistant—I forget his name for the moment, but he was a tall gentleman—endeavoured to do all he could; but there were certain things which he could not do without the permission of Colonel Jekyll, and I think Colonel Jekyll was difficult to get at at times.

2509. Anyhow, you do not consider you were very well treated?—No. I think the general impression of the British exhibitors was the reverse of being satisfied.

2510. Can you give any suggestions as to improving the organisation?—I think the best suggestion one could make would be to follow on the lines of the American section.

2511. What do those lines consist of, shortly?—Briefly, they used to run after the exhibitors and do all they possibly could for them, rather than let the exhibitors run after them.

2512. Do you think that they were more commercial and less official, or what was the great difference?—I think that they were much more commercial; they had a commercial man on the staff.

2513. A man actually engaged in trade?—Yes. Ferdinand Peck, I think, was the head of the American section. He was a big man in Chicago and in the financial world, and everything seemed to move with much smoothness.

2514. But he did not run after his compatriots did he?—No; but he had his assistants to run after them, and we had no one.

2515. Would you be in favour, then, of the whole thing being in the hands of commercial men?—Yes; I think we would be much better off then.

2516. Would you not have a Royal Commission?—I really do not understand what is meant by having a Royal Commission.

2517. Of course, a Royal Commission would confer dignity upon the governing body?—I think commercial men can show dignity sufficient.

2518. Do you think there would be dignity enough without their being a Royal Commission?—I should think so.

2519. Do you think that in this country it would be easy to get a committee of commercial men?—I think a mingling of the two would go very well.

2520. Do you attach any importance to there being as a small nucleus a permanent body who would have experience from one exhibition to another?—Yes, I think that would be an advantage.

2521. You have only had experience, I think you have said, at Paris and Chicago?—Personally I have only had experience at Paris and Chicago.

2522. Let us go back a little, and take Chicago. What were your criticisms on the management at Chicago?—My brother had more to do with that than I had in Chicago. It was run fairly well in Chicago, much better than in Paris.

2523. Do you think it was better than in Paris?—I do think so. Probably the facilities that were given in Chicago were greater than those that were given

in Paris. The situation, for instance, of the exhibition was more adaptable—it was in a circle.

2524. I remember that; I was there, and saw it?—At Paris, on the other hand, it was a very long, endless sort of affair, which was scattered about too much—that is, putting the Paris Exhibition in comparison with the Chicago Exhibition.

2525. I think at Chicago the nations were kept together more, were they not?—Yes.

2526. Instead of putting the separate classes of exhibits together?—Yes.

2527. Do you prefer the national form of exhibiting?—I think so.

2528. But it is not so easy to compare the exhibit of one country with the exhibit of another country in that way, is it?—I should think it would be so.

2529. The general exhibits of one country could be compared with the general exhibits of another, but your goods would not be next to similar goods from France or Germany?—No; they would be next to our own country's goods.

2530. And, from that point of view, you prefer a national exhibit?—I think so.

2531. In spite of your experience, you are still inclined to exhibit at future international exhibitions, I gather?—Personally I think it is a good thing if we could have a little bit more assistance and a little bit less expense. I would be sorry to see international exhibitions cease.

2532. You would not like to see international exhibitions cease, and you would not like to see this country taking no part in them, I suppose?—I think it would be a great mistake for this country to take no part in them. After all, we are very much dependent upon foreign countries.

2533. I think you have told me that you attach importance to the awards which are given for your exhibits?—Yes.

2534. Have you anything to say about the manner of giving those awards? At Paris, for instance, was that satisfactory to your mind?—So far as I could see, it was fairly satisfactory.

2535. You got a high award there, I suppose?—We got fairly high awards.

2536. Did you get a gold medal or a *diplome d'honneur*?—We got two gold medals and three silver ones, I think.

2537. Do you think that the awards are an important part of the exhibit, and that you could not do away with them?—I think that they are quite necessary. Unfortunately, we have got to pay for the awards that we get, if they are gold medals; that is the most peculiar part of it.

2538. That is to say, you get a bronze medal, and you make it gold by paying for it?—Yes.

2539. That has been the case for some time, has it not?—Yes, I believe it has.

2540. Now, about the expenses. I suppose your transport expenses (including freight and duty) were not very heavy for your goods, were they?—They were fairly heavy.

2541. Do you think any part of that expense should have been paid for you?—I think we ought to have had better rates. I think that should have been arranged by the British Commissioners with the railway comanies.

2542. Are you speaking of the Paris Exhibition of 1900 now?—Yes.

2543. I suppose your goods pay very high rates on the railways?—Yes.

2544. They come under a high class, as far as I remember?—I do not think we got much of a reduction on any of the rates; it was pretty well the same as in ordinary cases.

2545. That is, you paid the ordinary commercial rates?—Yes.

2546. But you think for exhibitions the goods ought to pay less?—I certainly think so.

2547. It would not be easy in this country to do that, would it, if we had an international exhibition here, because the railways are not the property of the Government?—I think an arrangement could be come to with the railway companies.

2548. Even with our railway companies here?—Yes, I think so. I do not think they are so arbitrary that they would not make a special rate in the case of exhibitions.

Mr. W. Muppin and Mr. R. J. Gibson. 14 Feb. 1907.

2549. I think you said that you thought the decoration was a great expense to exhibitors?—Yes. What principally struck me was the American section; and there were several sections which were done pretty much in the same style as the American section. The American Commission took the whole of the decoration upon themselves, and made it a uniform decoration outwardly, the inside decoration being done by the exhibitors. The moment you came to the American section you knew at once that it represented the United States; whereas when you walked into the English section you did not know whether you were in the English section or whether you were out of it, because everybody had their own idea, and it was "straggled." It seemed to me such a pity that the English people could not take it up in the same spirit as the other countries do, and make it represent England, so that the moment people went into the section they could say, "This is representative of England."

2550. Would you like the governing people—the Commission, or whatever it is—to take it out of the hands of the individual exhibitor?—I think it would work very much better that way.

2551. So that you might have one great scheme of decoration?—I think that would be very much better. Then the cost of the decorations could be equally divided up. By that means the cost of the decoration of the place would be very greatly reduced. If one in a private way takes several places and then gets different people to carry out their own ideas, it becomes much more expensive than if one carried out one general idea for the whole affair.

2552. Did you visit the British pavilion at Paris?—Yes, I did.

2553. Do you think that the cost of that was justified?—I do not think it was.

2554. You are aware, I presume, that it cost a very large sum?—I think it cost considerably more than it ought to. It was an Elizabethan structure, and they exhibited some very fine pictures there. I think there was more attention paid to the Elizabethan Pavilion in the way of the society functions than there was to the hard working exhibitors. I know I worked pretty hard in the section as a British exhibitor, but I do not think I can recollect, with the exception of once, I think, that I got an invitation to the British functions; and yet I was at almost every one of those given by the United States Commission.

2555. Here again you are giving us rather a criticism of the management of the functions, are you not?—I do not know what it was due to, but at any rate that is what happened.

2556. Of course, we want to hear what your experience was. The pavilion was very much admired was it not?—I think generally it was very much admired. Personally, I think it could have been very much nicer, but still that is only a matter of opinion.

2557. Do you remember the exhibition at Chicago?—I do not recollect the exhibition at Chicago. It is a long time since the Chicago Exhibition.

2558. Then I will not ask you about Chicago. Generally, I presume you would attach some importance to the social functions if they were properly administered?—Yes. I think there ought to be a certain number of social functions; I think that is essential.

2559. You say that the Americans had a good many; anyhow, they asked you to a good many?—Yes, the Americans had a fair number.

2560. (*Mr. Wilson Fox.*) As we know, your firm has got a world-wide reputation; having got into that position, do you attach as much importance to sending your exhibits to foreign exhibitions as you would if you were in a less prominent position in the eyes of the public?—Yes, I do. Take our name and what we are principally known for—Prince's plate. If we drop advertising Prince's plate, it would be dead, yet it is world-wide known. It is just the same in everything else.

2561. Do you look upon a foreign exhibition then as one means of maintaining your reputation?—Yes, it keeps our name constantly before the public of all countries.

Mr. W. Mappin and *Mr. R. J. Gibson.*

14 Feb. 1907.

2562. Do you think that showing at exhibitions is as essential a method of maintaining your reputation as the ordinary mode of advertisement or employing travellers; or do you think that all three methods are useful?—I should think all three methods are useful. It would be difficult to discriminate between them.

2563. When you show at a foreign exhibition, do you do it more with an eye to your export trade—that is, with an eye to getting new clients abroad—or do you do it with a view of maintaining your reputation in England by means of the awards that you will get?—The first thought that comes into our mind is our home trade; that is what we depend upon. Secondly, we have got an eye to having foreign trade as well.

2564. But you could not say definitely that the result of the Chicago and the Paris Exhibitions was to get you new orders abroad in any foreign country, I suppose?—I think the object of exhibiting in Chicago was more or less to catch, if I might use the term, the American trade.

2565. I suppose there is a pretty keen competition in America?—Yes, there is. American goods are very expensive, as I think we all know, and Americans are very good customers if you can get them.

2566. But still you told Sir Alfred Bateman that you do consider it worth while to exhibit at these foreign exhibitions?—Yes, I do.

2567. Therefore, we come to the point that as far as you are concerned, what you want is good organisation?—Yes; I think the whole secret of success is organisation.

2568. I take it from what I have heard that in the exhibitions you have had to deal with, you have not been entirely satisfied with the organisation?—No, and I do not think I am alone in saying so.

2569. Let me take one point which must be an important one to you, and that is the allocation of space at a foreign exhibition. Have you been satisfied with the amount of space and also with the locality in which the space has been allotted for the British exhibits?—Yes, we have been fairly satisfied. With regard to the Paris Exhibition of 1900, we were rather disappointed to start with, and it was with some difficulty that I persuaded the British Commissioners to obtain for us new space. It was not really new space, because it was on the same spot, but we got additional room. The first space which they allotted us was a very bad one.

2570. But in the end you were favourably placed?—Yes, the position was very favourable.

2571. Is it your impression, having regard to the fact that you think the organisation is not up to the mark, that money is wasted in existing circumstances?—I should be rather inclined to think so.

2572. Do you think as regards the future that the management of an exhibition from the English point of view requires better organisation rather than more money from the Government?—It is very difficult to say.

2573. But you think there ought to be some Government support?—I am quite agreeable to there being Government support.

2574. In the way of organisation?—I think so.

2575. That is as regards the decoration of the British exhibits, if I rightly understand what you said?—Yes.

2576. And as regards getting proper space?—Yes.

2577. And as regards getting good terms with the railway companies for freight?—Yes.

2578. Now as regards the individual manufacturer, how much farther do you think we can go? Taking the Government point of view, what else do you think the Government could reasonably do? You would not ask the Government to pay for the preparation of your exhibit, would you?—No.

2579. Supposing the Government could get you good space in a favourable position, would you expect them to pay for that, or would you expect to do it yourself?—If we were charged for the space I should think the Government ought to pay for the decorations. They ought to subsidise to a certain extent—I do not say in a large way, but they ought to minimise the expense of exhibitors.

2580. How often do you think that a company of your standing would be prepared, without feeling it a great burden, to show at international exhibitions?—Providing international exhibitions were not too frequent—providing they were held, say, every seven to ten years—I should not suppose that the exhibitors would think it a hardship to exhibit at all those.

2581. But you would not be prepared to show at a big international exhibition, say, every three years?—I think that that time would be too short. You see, in three years there is not very great time for new developments; on the other hand, if certain exhibitors made a show at an exhibition this year, say, and three years hence there was another international exhibition, there is no reason why other firms, who may have made improvements, should not spring up and take the place of the ones who had shown at the previous exhibition.

2582. I want to find out how much the commercial men in this country could stand in the way of showing. We cannot expect them to be always sending valuable exhibits to exhibitions. I do not know whether you would take this view—that it might possibly end in deteriorating the standard of the exhibits if there were too many exhibitions, because firms would not go to the expense of making up very costly exhibits often?—I should think every five years would be a very good average. Earlier on I forgot to mention that we exhibited at Glasgow in the year following the Paris Exhibition of 1900. We went to Glasgow, and we had rather a bitter experience of Glasgow.

2583. Do you mean in the way of organisation?—Yes.

2584. Did you find that the Glasgow Exhibition was better organised than the exhibitions at Chicago and Paris?—We found in the Glasgow Exhibition that we could not sell any goods at all.

2585. (*Chairman.*) That you could not sell in Glasgow?—We were worse off in Glasgow than in Paris in that respect. That was the peculiar part of it.

2586. (*Mr. Wilson Fox.*) But you found the organisation better?—The organisation I think was better. It was very clanny.

2587. I suppose you looked round the other exhibits besides your own at Paris and Chicago?—Yes.

2588. What was your opinion of the British exhibits at those two exhibitions as compared with the foreign exhibits? Do you think they compared well or not—I mean were you proud of the British exhibits, or were you not proud of them?—I was not.

2589. You were not?—I was very disappointed.

2590. That is taking the British exhibits as a whole?—Yes.

2591. I am only trying to get at your opinion: taking the British exhibits as a whole you were disappointed in both cases?—Yes, I was. I think the best part of our exhibit was the machinery section; that was fairly good.

2592. I am speaking now entirely of the commercial side?—And you are taking the exhibition collectively?

2593. Yes?—I do not think it was up to the standard at which England might have been represented.

2594. Was it in quality or in quantity that you think we were behindhand?—I think in both.

2595. (*Mr. Harris.*) I think you said that in exhibiting abroad you looked chiefly to your home trade?—Yes, that is the first consideration.

2596. Do you think that that view is prevalent among manufacturers who exhibit?—I think it is, except probably in regard to machinery. Perhaps the makers of machinery look to foreign countries for large orders.

2597. Would you say that the value of the orders got by exhibiting justifies national expenditure on representation at foreign exhibitions—speaking from your own experience?—Yes, I would be inclined to say so.

2598. Do you not think that you, as manufacturers, can do better by not exhibiting at all, and by simply pushing your home trade here?—I should not like to say they could. I should be inclined to say no to that question.

2599. As regards exhibiting out of this country, would you draw any distinction between a Colonial exhibition and a foreign exhibition? I mean, do you think that you would gain more from an exhibition like the present New Zealand Exhibition than from an exhibition at Paris?—We would gain more from a Paris Exhibition.

2600. As regards awards, I think you observed that awards were given for the best goods?—Yes.

2601. We have had evidence here to show that the mere quality of the goods is not necessarily the first factor in an award, but that the standing of the firm is considered. We will suppose for a moment, what is—shall I say?—impossible, that a young firm was producing a better plate than your Prince's plate, and went into competition with you at an exhibition; do you consider that that firm would have a fair chance of beating you in the awards?—Yes, if they have got the proper judges.

2602. What do you mean by the proper judges?—If the judges were selected for awarding upon merit, then the people who produce the best article naturally would get the best award.

2603. Then you do not attach much importance to the idea that considerable marks are given for the standing of a firm, so that an old firm like yours always has a big handicap in its favour?—No, I do not. That may bear weight in the mind of the judge, but that entirely depends upon the judge.

2604. That is my point; does the judge give a fair award?—I think so as a rule; take, for instance, our case!

2605. (*Sir Isidore Spielmann.*) Were you invited to exhibit at the St. Louis Exhibition?—Yes, we were.

2606. Can you tell us why you did not exhibit?—It was too expensive. Our experience in going across to Chicago has remained so forcibly in our ledgers that we thought the best thing was to withdraw.

2607. Did the Commission for St. Louis offer to assist you in the matter of expenditure?—I do not remember, because I did not take up the question at all. We dropped it so soon as the notice was brought, and we did not go further into the matter.

2608. Had the prohibitive tariff of America anything to do with your refusal?—That would be the principal reason.

2609. Did you exhibit in Brussels in 1897?—No, we did not exhibit.

2610. Are you quite sure of that?—Yes.

2611. With respect to your space, are you satisfied with your neighbours as a rule at these exhibitions?—As a rule I have been.

2612. Would you rather have a firm representing your own industry next to you, or a totally different industry?—Personally, I would rather see one in our own business.

2613. We have had witnesses here who have told us that they have had placed next to them such exhibits as trousers-stretchers, and that that has acted rather in a disadvantageous manner to them; have you had any such experience?—I think I know the firm that you refer to. I should not like to have had a trousers-stretcher next to me.

2614. A neighbour of that sort would be harmful perhaps to the exhibit of an important firm?—I think it would be a very great objection.

2615. You have referred to two inconveniences which you suffered at the Paris Exhibition through, I think you said, the Chief Commissioner not being very accessible, and so forth; and you particularly alluded to the fact that you could not get passes?—Yes, that was the case.

2616. Is it not just possible that the exhibition administration was the cause of all those troubles?—I do not think so, and for this reason—if the United States were able to get their passes before the Exhibition had been opened and to distribute them amongst their exhibitors, why should not England have been quite as sharp? I think England ought to be as sharp as America.

2617. I am not defending the Commission, mind you; but the Commission may have been desirous of helping you in every possible way, yet if the exhibition authorities did not issue the passes at the right time, the Commission is not to be blamed. I was myself in Paris, and remember the incidents perfectly well. Do you not think it is possible that instead of the Commission being to blame, the exhibition authorities themselves were to blame?—I do not think so. I think it was entirely the fault of the English people. I have an illustration in another way. I was advised by the French authorities themselves to apply on behalf of one of our proprietors for the honour of *officier* of the Legion of Honour, the gentleman having been *chevalier* for some long time. The excuse the British people gave for not applying for it was on account of the representations in the French gutter Press of our late Queen. That was the reason which the English authorities gave for not putting forward the name of a gentleman who had done a good deal in French Exhibitions to receive the honour of *officier* of the Legion of Honour in place of remaining *chevalier*.

Mr. W. Mappin and Mr. R. J. Gibson.
14 Feb. 1907.

2618. No doubt there were political influences at work about that time, but I myself employed a large number on the staff in the Arts section of the Paris Exhibition, and I know as a fact that the authorities were changing the nature of the passes every fortnight, and that I was greatly inconvenienced myself. As regards the special rates, are you sure that there were no special exhibition rates for transport in connection with the Paris Exhibition?—I think there was a slight reduction, but I do not think it was very material, as far as I can recollect.

2619. What is your opinion of collective exhibits? Would you, as a trader, be disposed to participate in collective exhibits with other firms of equal standing if you were invited to do so?—Do you mean to share the expense with other firms?

2620. To make one large exhibit of your best productions with similar firms, the expenses being borne in a great measure by the Commission?—I do not see how it could very well act.

2621. Would you rather be independent?—I think it is always much better to be so.

2622. And pay your own expenses?—Yes, up to a certain point; but I think we ought to be subsidised a little bit, as I have said before.

2623. (*Mr. Malcolm Ramsay.*) Would you tell us how you first get word of a coming exhibition?—We generally get it in the form of a printed communication from the commissioners, or whatever the body is.

2624. That may be rather late in the day, perhaps. Have you experienced any difficulty from getting late notice of a coming exhibition?—I cannot recall any difficulty in that way.

2625. Supposing there was an exhibition at which this Government was not going to be officially represented, whence would you get your information then?—I presume from the same source—the foreign authorities.

2626. In considering whether you will exhibit at an exhibition abroad, would you be much influenced by the consideration that the Government was not officially participating?—I do not quite follow that.

2627. For instance, in the Paris Exhibition of 1889 the British Government was not officially represented, whereas it was officially represented in 1900. For your purposes, would it make very much difference whether the Government was officially participating or not? In other words, would you have declined to go to Paris in 1889 on the ground that there was no official British participation?—I think it is better to have an official participation.

2628. Were you invited to go to Paris in 1889?—We were invited to go to Paris.

2629. And what did you do?—We were represented in 1889.

2630. That is a case where there was no official participation—I mean no Government grant?—Yes.

2631. So that the absence of a Government grant did not prevent you from exhibiting at Paris in 1889?—No. But that was just before my time, and I had very little to do with it.

2632. I gather from your answers to previous questions that, on the whole, you would be sorry if there were no international exhibitions at all?—Yes, I would.

2633. Would you regard it as a misfortune for your trade?—Yes, I think so.

2634. I suppose, when considering an invitation to exhibit, you are very much influenced by the country in which the exhibition is going to be held?—Yes.

2635. Would you consider it worth while to exhibit in the smaller capitals of Europe?—No, I should not.

2636. I think you said you did not go to Brussels?—That is so; we did not.

Mr. W. Mappin and Mr. R. J. Gibson.

14 Feb. 1907.

2637. Then there was the Antwerp Exhibition in 1894?—We were not there.

2638. Would you think it worth while to go to Vienna?—I do not think so. There is too much for sale on the English market received from Vienna.

2639. Or Berlin?—Yes, I think it might be worth while to go to Berlin.

2640. Practically it comes to this, does it not, that the bigger the capital the greater the advantage?—The greater the attraction. My reason for not going to the smaller capitals of Europe is that you do not get the volume of people there, because there are not the attractions. If there are attractions in the city where the exhibition is held you will find a mass of people, and you will find accommodation for them, whereas you will not find that in the smaller capitals of Europe.

2641. I suppose you would think that if the Government was going to officially participate in exhibitions it is better to do it well or not at all?—Yes, I do think so.

2642. From your point of view you think exhibitions are an advantage?—Yes.

2643. Can you tell us whether you find manufacturers share that opinion generally? In other words, do you believe the trade generally shares your opinion?—I think that opinion is general.

2644. I presume there are some particular businesses which stand to gain a great deal more from exhibitions than others?—Yes, I should think so.

2645. As regards the expense, I gather from your previous answers that you attach a great deal more importance to having a proper organisation for the purpose of securing to you the maximum advantages than to being directly subsidised by the Government?—I think the principal thing in any case is the organisation, because that in itself minimises the cost.

2646. You would not expect the Government grant to be spent on anything else than the general organisation, would you? Would you not ask for direct grants to relieve you of expenses?—I think, as I said before, that if the exhibitors pay for the space the Commission ought to devote a substantial portion of the handsome amount that is granted to them to the decoration of the section. It is in any way a subsidy.

2647. I suppose you regard the exhibiting as an advertisement?—We certainly do.

2648. Therefore, I presume, you are willing to pay for that advertisement as you do for your own private advertisements?—Yes. Our internal decoration of the space that we are allotted is a very great expense to us, and if in addition to that we have to make our external decoration, that will be a still further expense.

2649. I suppose having to pay the cost of that would not necessarily deter you from exhibiting in Paris on a future occasion; you would not decline to exhibit in future, would you, on that ground?—No, I do not think we would.

2650. Is it the case that the cost of the space is not a very large item compared with the expenses which you would in any case incur?—No, the cost of the space is a small item.

2651. As a matter of fact, it is a pretty heavy expense even to go to Paris, I suppose?—It is.

2652. (*Mr. Wilson Fox.*) Arising out of that, would you prefer to pay for your own stand in which you show the goods, and to have the control of the architecture of it, or would you wish that to be done by the Government on uniform lines?—I think that having it done on uniform lines would be the better plan.

2653. If you got the space and went to Paris and found the stand already made in which you could put your exhibit, you would not grumble at the mode in which it had been erected, would you?—No.

2654. Do you think that more commercial men would show if there was more individual application—that is, more personal application made by the Commissioners? At present a circular comes round to a firm, and it may go into the wastepaper basket. Do you think that more firms would show if some prominent official of the Royal Commission were to come round personally and call on firms, and put before them the advantages and disadvantages, it may be from a business point of view or even from a patriotic point of view? Do you think more personal application of that sort would produce a better result?—It would bear very much more weight.

2655. (*Mr. Malcolm Ramsay.*) Suppose that by some chance the British Commissioner for an exhibition was to forget to send a circular to invite you to participate, would you apply to the Commission?—It would depend entirely as to where the exhibition was going to be held. If such a case happened to us and we considered that it was worth our while to exhibit we should apply for it.

2656. What I am trying to ascertain is whether you think you have sufficient means of finding out about the probable advantages of foreign exhibitions without receiving a direct invitation through the British Government. Are you satisfied with the present state of things?—I do not quite follow.

2657. I was going back to a question that I asked before. Supposing there was going to be an exhibition at Bucharest, and you received no official communication from the British Commission on the subject, would you find out about it from other exhibitors, or would you think it worth while to write to the foreign country and find out?—I think if we took an interest in the exhibition at all through seeing it advertised we should apply direct, but I should think that we should inquire first of all to see if there was anything being done in England in an official capacity.

2658. Do you mind telling us how much it cost you to exhibit at any exhibition, say at Paris in 1900?—Roughly speaking, I think our expenses were somewhere about £4,000.

2659. (*Mr. Wilson Fox.*) Does that include the preparation of the exhibit?—Yes, that includes the preparation of the exhibit, and it also includes freight, I think.

2660. Would it include the expenses in Paris of those who went over to look after the exhibit?—No.

2661. Those expenses would all be in addition?—Yes.

2662. You do not know what the gross cost was?—No.

2663. (*Mr. Malcolm Ramsay.*) Would that £4,000 include the cost of an agent in Paris, if you had one?—No.

2664. Did you have your own agent who was looking after your exhibit?—We had four assistants over there.

2665. And you do not put that in the figure you have given?—No; that comes into our ordinary expenditure.

2666. You went four people short at home, did you?—I think we kept our full staff at home; we had to add to our staff.

2667. (*Mr. Wilson Fox.*) That would add considerably to the cost?—Yes.

2668. (*Sir Isidore Spielmann.*) Would the orders received recoup you for those expenses?—No, nothing like it.

2669. But the awards would?—It is very difficult to know where an exhibition does make it pay. It is like advertising; you cannot put your finger down anywhere and say, "This makes it pay."

2670. (*Chairman.*) I did not quite understand why it was you did not exhibit at St. Louis; was it on account of the extra expense of taking your goods there?—It was principally on account of the very heavy duties.

2671. Not on the goods you were sending there, because they did not pay duty?—No; they did not pay any duty unless you made any sales, for instance.

2672. Your high-class goods, I suppose, go into the States a good deal, in spite of the duty, do they not?—Yes, they do; but we have not got to pay the duty; the customer who purchases the goods generally pays that.

2673. The customer pays it?—Yes, he does not worry us.

2674. I suppose you find that there is very strong competition with you in America?—Yes; we have got a fair amount of competition in America.

2675. Still, you do a trade there in very high-class goods?—Yes; we do. Americans like English goods; there is no question about it. They have a happy knack of saying "No," but still English goods find their way across the herring-pond.

2676. (*To Mr. Mappin.*) Have you anything to add to what Mr. Gibson has said?—(*Mr. Mappin.*) In regard to America, as Mr. Gibson says, we sell a lot of goods to go abroad there, but we find it is only to those people who are very rich, or who have special facilities for getting them over without paying the duty.

2677. Not by smuggling, I suppose?—You may put it any way you like. Our experience is that the ordinary person will not pay the duty. We have to pay 45 per cent. into Buenos Ayres, and the tariff in the United States is very heavy, of course, on our class of goods.

(*Mr. Gibson.*) In the United States they have got peculiar duties. For instance, if you take an undrilled pearl you pay 10 per cent., but if you take a string of pearls you pay 60 per cent.

2678. (*Chairman.*) (*To Mr. Mappin.*) Is there any other observation you would like to make?—(*Mr. Mappin.*) In regard to the international exhibitions that we would be most likely to exhibit at, of course nothing compares better than Paris. That is the place. With regard to what these other gentlemen have said about Brussels and Antwerp, I do not think for a moment our directors would entertain going far afield, because they would not feel that they would get a return. Then you see personally looking after it would be so much more expensive, because they would have to go backwards and forwards, and they would be keeping somebody there. The nearer home, of course, the better it is.

Mr. W. Mappin and Mr. R. J. Gibson. 14 Feb. 1907.

2679. I suppose you would not go to poor countries?—No, it would not pay us at all to do that. I think Paris is far and away the best for us. I do not know that our directors would entertain the idea of going to other places, but they would not mind paying a lot of money to go to Paris, because you have so many people travelling through the city there.

Mr. Ira Henry Hillman, called and examined.

2680. (*Chairman.*) Can you tell us what business you have been engaged in?—I am an exhibition agent.

2681. You have been connected with several exhibitions, I suppose?—With most of them for more than 20 years.

2682. Can you tell us the principal ones?—Paris, 1889; Chicago, 1893; Paris, 1900; St. Louis, 1904; then Jamaica, Kimberley—I think pretty nearly all of them.

2683. Were you in Brussels in 1897,—Yes, and in Antwerp in 1894; and also in Glasgow.

2684. Were you at Milan last year?—Yes, I was at Milan last year, at Edinburgh in 1890, and in Australia and in the West Indies, too.

2685. Then you have had a very large experience?—I think as much or more than as any agent.

2686. I understand that you do not care to go into the first few questions on our list?—No.

2687. I will begin with asking you upon Question 5. Do you consider that the direct commercial results obtained by the official participation of this country in international exhibitions has been such as to warrant the Government in giving grants for the organisation of British exhibits in future?—Yes, I believe the results have been good.

2688. Do you think that we could not have had equally satisfactory results by private enterprise?—Not very easily.

2689. Not very easily, but still that we could have got them?—I think we might have got them, but not unless we had a very carefully organised committee of exhibitors and a permanent committee of exhibitors existing beforehand.

2690. A permanent committee of exhibitors, do you say?—Yes, I think there should be that.

2691. Supposing that there is public money granted, should that grant be made subject to any conditions about accommodation and facilities?—Yes. I think that is a very important point, because at the last exhibition in Milan I consider the exhibitors were badly treated by the officials, who did not fulfil their promises even. In the way of charges, the exhibitors were overcharged.

2692. For space?—No, not for space, but for the loading and unloading, and the general expenses of moving the exhibits there.

2693. Do you mean that the charges were raised upon them?—Yes, they were; and altogether the official people who dealt with the exhibitors there were very difficult and very unfair, I consider, and we had no appeal.

2694. Did you not appeal to the British staff there?—Yes, but they were not able to help us, because in this instance the President of the Exhibition, Signor Mengili, if I am rightly informed, was one of the principal owners of Gondron Frères. Gondron Frères, and the other carriers made a ring, so that if any appeal was made to the President by exhibitors who considered they were overcharged, it was simply referred back to the *ufficio recevimento*, and, as the President himself was interested in maintaining these high charges, nothing was done.

Mr. I. H. Hillman.

2695. Did you not complain to the British Commissioners?—No doubt the representative of the British Commission out there was perfectly cognisant of this. He knew quite well what was going on, because we had often talked of it. But I did not appeal to the Commissioners for assistance to get the thing altered, because I knew that it would not be done. That is just the long and the short of the matter.

2696. You thought it was of no use?—Not a bit.

2697. You were not satisfied with the methods adopted for the British exhibit at Milan?—I was not satisfied with the charges made by the Italian Committee or with their consent. But I am not making any complaint about the British Commission. On the contrary, I believe that we have had more assistance, at any rate more sympathetic assistance, from them than we have had from the Commission at almost any previous exhibition. My complaint is against the Italian Committee for allowing the *ufficio recevimento*, a body organised within the Exhibition Company, to practically do what they liked with us, there being no appeal against them. I think this is an essential point, that we should in future so arrange things that they could not take advantage of us when we are once within their hands.

2698. Had you any complaints about the Paris Exhibition of 1900, and your treatment there?—No, I had no complaints there. I think the French and the Belgians are very much better to deal with than the Italians have proved to be.

2699. Coming now to the general organisation of exhibitions, how do you think British methods compare with those of other countries, so far as you know them?—As far as I know them, France takes the premier position. I am connected with the installation of and dealing with the exhibits, and I have had nothing to do with the executive except as it affects the installing, the looking after, the return, and the transport of exhibits; so that it is from that point of view that I look at it. Judging from the general effect in previous exhibitions, France in my opinion takes the first place. As to Germany, my impression was—and this was especially noticeable in Paris and in St. Louis—that the exhibit was more for Germany as Germany, as a nation, than for the individual exhibitors; the individual exhibitors were rather pushed aside, and were not prominent enough. Our method has that advantage, that the individual exhibitors are prominent.

2700. You thought the German method was too bureaucratic, in fact?—I did; and the way in which it was planned out, too.

2701. Would you like the United States methods?—I think the United States was better organised, in regard to transport especially, in their case.

2702. Are you speaking more of transport than you are of the position of the exhibits and the spaces allotted to them?—I am speaking of both. I am considering the exhibits, because I have been greatly interested in them. The impression upon visitors is

Mr. I. H. Hillman.

14 Feb. 1907.

in a great measure gained from the *tout ensemble*. The question is, when they come into the place, how it strikes them as they enter. Germany was very impressive in Paris and in St. Louis, but, as I say, I think the individual exhibitors were rather pushed aside, and were not so prominent as they should have been.

2703. What do you say about Belgian methods?—I think, especially in Milan, the Belgians had a much greater show for their money than some other countries.

2704. You rather prefer the Belgian methods, then?—I prefer France.

2705. France is the best, in your opinion?—Yes; I should like, if I might suggest it, the methods of France, but somewhat modified.

2706. How would you modify them?—I think it would be best for the manufacturers to deal with it generally, and to have a society formed by intending exhibitors, which any manufacturer or inventor could join on the payment of a nominal fee, and that there should be a permanent staff, which should be very simple, and one kept down to the lowest possible point. Then, if the society was formed, and the committee decided to go in for an exhibition, the Government should make them a grant, provided, of course, that the thing was organised properly; and the Government should afterwards send out a Commissioner, who should not be necessarily received by the Commissioner on the spot, but who should himself go round and look at the exhibits and form his own opinion, without a good deal of trumpet-sounding and flourishing, future grants being made or held back according to his report, and his report should have a great deal to do with the grants which were made in future. It seems to me that in the past too much money has been spent in the office and in ways which it would have been better to have avoided, and not enough on the exhibits and the arrangements and the decoration of the sections themselves.

2707. In fact, you would start the thing rather from the other end, and you would make the exhibitors the foundation?—Yes.

2708. A committee of them, or a society of them, would start it?—That is it.

2709. And the Government would only come in when you wanted to get some money out of them?—Yes; but I should like to see the fullest oversight on the part of the Government in order to see that the money was properly applied, and so on. It seems to me that the worst of Government affairs is the want of initiative. No man has any power to take hold of a thing and do anything himself. He always shirks it; he looks at his orders, and he gets out of it because he does not want any responsibility. I would like to see individuals allowed a certain play, where they can go in and take an interest in it and do it well.

2710. But you must have some managing body, must you not?—Yes.

2711. What would your managing body be—a committee of this society?—I should say so.

2712. Not a Royal Commission or a Government Commission?—No. Then there is the social aspect of the thing; that might be managed simply by a Commissioner who would go out to do the polite, but if you mix the two it seems to me that the business man gets left.

2713. The Government Commissioner would be more of an inspector, who would go out to see that things were rightly attended to, and who would do the social functions?—Yes, that might be so.

2714. But he would not have charge of the installation, or of the getting of the exhibits?—No. If it was necessary to have someone there from the social point of view that might be done; but at present I do not think that the money is very well spent, nor that the best results have been obtained under the conditions which hold now.

2715. Do you think that too much was expended at Paris on the pavilion, for instance? Do you think that was money wasted?—I am not up in these figures, but as to the general effect, in my opinion there was no other pavilion, especially having regard to the interior, which could in any way compare with ours. I think the effect of Morris's tapestries in the hall was simply magnificent.

2716. You were proud of that as an Englishman?—Yes, there was no doubt about that. It was very good indeed.

2717. I suppose under your scheme you would not have such a pavilion as that, would you?—Not necessarily. The committee of exhibitors or the society would not be able to deal with that question of the pavilion very well, would they? I should hardly think so. I was thinking more of their actual dealing with the exhibits and the space.

2718. Now about the decoration, should that be uniform, and should it be done by the committee, or should each exhibitor do his own?—I should prefer to see that done by the committee, because that is where we have failed a good deal. In Paris, for instance, I remember a case in point. The chemical section was in a square place with only one entrance, and the Sunlight soap exhibit was put up right across the front. It had a solid back, and anyone passing could practically only see the Sunlight soap exhibit, the others were lost.

2719. Were there other exhibits inside?—Any amount of them. A number of exhibitors came over and complained. Colonel Jekyll, I understand, gave them permission to rearrange the exhibits, providing all would agree, but nothing was done.

2720. In fact the Sunlight people had captured the whole of the show?—Yes.

2721. (*Mr. Wilson Fox.*) If your committee of commercial experts could not agree on a change in that case, how could they look forward to running an exhibition successfully in the future?—Yes, that is a very good point. But that occurred after the exhibition had been completed, and during the running of the exhibition, probably during the second or third month. It is a difficult proposition to tear a whole section out in the middle of an exhibition and rearrange it. Of course, Sunlight soap would object for one thing, because he was all right. But there is no reason why a body of men should not agree, just as the continental railway companies agree among themselves with regard to their traffic arrangements. They are not compelled by law, I understand, but they do agree.

2722. I do not say that an agreement is an absolute impossibility; I was only asking you the question on your own evidence?—Yes, I understand; but that was the reason, though, just at that time.

2723. (*Chairman.*) In other ways, how did you find the organisation of the British Royal Commission at Paris?—I think it was pretty good. Colonel Jekyll I noticed did not waste any time or money after the affair was over, but dismissed his staff. With regard to St. Louis, to my astonishment they kept them on. Are they all there now? Probably they are. I have not been round to see; I am going, though.

2724. You do not know how long it takes to wind up a Commission, do you?—I know what it takes us. We have to get our things wound up in about six weeks, or else we get into a difficult position.

2725. You think they have been too long in winding up?—I think they are terribly long-winded.

2726. That is the public purse point of view. As far as your exhibitors were concerned, had they much to complain of, do you think, at Paris or at St. Louis?—They had not, except as regards the spacing of the exhibits. That is one point which I think should be very carefully attended to. Then, I think, having regard to the amount of money which they had in the grant, arrangements should have been made for free transport, or, at any rate, for very careful arrangements in that way; but nothing was done, and it was all left to the individuals.

2727. Did you have to make your own bargains with the railway companies and the shipping companies?—Certainly. There were rates, you know, but each individual had to look after his own exhibits to a certain extent. There were some collectivities in St. Louis.

2728. Did you not get a reduction of rates?—Yes, there were some reductions; but I think in the case of a large Government grant—if that is going to occur any more—the transport should be free, and the things should be collected and delivered by the Government. I think that would be to the advantage of all parties.

2729. But you would not include the packing and unpacking, would you?—No.

2730. That should be done by the exhibitor?—Yes.

2731. You would include the transport?—Yes.

2732. How about the space; you would not include payment for space, I suppose?—That would depend on other conditions. Sometimes they have returned portions of the money, and I think once or twice they have returned the whole of it, but at present I am not at all satisfied with the way in which things are run, and I think that it could be done a very great deal better.

2733. Do you think that an association of manufacturers and merchants, who had paid a small subscription, could be a committee which could practically manage the thing better than it is done now?—Yes, I think it could be done that way better.

2734. And the chief duty of the Government should be rather to give you a sum of money?—And to severely criticise the way in which it was spent. I am doubtful whether an officer from the Government should come over to an exhibition, and just be escorted through the principal passages, or one of the passages, or through one building, and then should go back thinking things were all right. I am inclined to think that that is not a proper supervision of the spending of the money.

2735. Do you not want a figure-head for the management of the British section in an exhibition?—Not necessarily, that I can see, except for social purposes.

2736. You do not attach much importance to the social purposes, do you?—No, not so much. The people who were invited to these functions were not always people in any serious position, so I understand. I never went to one; I had always plenty of other work to do. But I am given to understand that they were not always the leading lights, either in commerce or in anything else.

2737. Do you think the invitations rather went by favour?—Yes.

2738. Would you have a permanent committee from exhibition to exhibition, or a small nucleus of a committee which should always keep the records?—I should have a permanent organisation, though not a permanent staff.

2739. But that should not be a Government organisation?—That is so.

2740. Not at all?—No.

2741. You think that the Government might spend this money, and simply have a sort of inspector or Commissioner present during the exhibition, seeing that it was not wasted?—Yes, I think that should be one of the ways. Besides the exhibitors themselves would be, I consider, not very smart business men if they allow the money to be misspent when it was intended to be applied for their benefit. I should hope that they would be wide enough awake to get the full advantage of the money, but at present they have not the chance of doing so.

2742. You think, in fact, money has been wasted?—I do think so.

2743. I think you told us you did not approve of the German system very much?—Not altogether. I think it is a little too much Germany. There is a point I should like to mention, if I might, before I forget it, and that is with regard to exhibitions in which there is no official participation. I think it is very important that some steps should be taken to prevent persons being appointed Commissioners who are unsuitable. The only way in which it has occurred to me that that could be done, seeing that there would be no Government grant and no official participation, would be to make it a rule in some way that in a case where there is to be no official participation and no grant, the nearest Consul should be nominated as a Commissioner, even if nothing was done, in order to prevent these unsuitable men getting in.

2744. But directly you get a Consul, then you have got a Government official?—I know. I am speaking now of those exhibitions in which there is no Government participation.

2745. Although there would be no Government money given, still you would have a Government official at the head?—In a way I would. It is the only solution that I can find, but perhaps there are other ways.

2746. We want to get your views?—For the benefit of the manufacturers, and for the credit of the country generally, I particularly wish to prevent any person obtaining from a foreign exhibition society the appointment as Commissioner for Great Britain, because the public immediately think that he is representing Great Britain, whereas he is not, he is only representing the exhibition society.

2747. Do you make this recommendation because you know instances in which harm has been done?—Yes.

2748. You say you know instances in which harm has resulted from persons not suitable in some ways being appointed as Commissioners, in cases where the Government have not given a grant, and have not taken a direct interest in the exhibition?—That is it. I think that a Consul might do that, although there may not be any exhibits. If intending exhibitors had to apply to him in the first place, he could if he required take simple steps to find out whether the intending exhibitor was a *bonâ-fide* manufacturer or exhibitor or not, and if he found that he was not, he could say "No, I cannot let you in." We should prevent two things then. We should prevent people getting in who ought not to be exhibitors, and we should prevent an unsuitable man being appointed as a Commissioner. If nothing was done at the exhibition it would not matter as I can see. It would simply keep an unsuitable person out.

2749. Do you mean that this Consul should be appointed by the Government?—As I understand, when an exhibition is intended to be held abroad, they almost invariably apply to the Government to see if they will go into it, do they not? In that case, if it is decided not, it would be a comparatively easy matter, would it not, to say in reply, "We are not intending to take part in this officially, but if there is to be a British section we would like that our nearest Consul should be nominated Honorary Commissioner."

2750. At present in the case of such exhibitions it comes to a body like the London Chamber of Commerce to appoint someone, does it not?—Sometimes, not always though. I have known people to be appointed who were about the very worst selection that it was possible to obtain.

2751. (*Mr. Harris.*) Appointed by whom?—By the exhibition company abroad.

2752. (*Mr. Malcolm Ramsay.*) Following up that last point about the Consul, I quite understand the object that you have in view, but would not the fact that the Consul was nominated British Commissioner immediately give an official *cachet* to everything he did?—I suppose it would to a certain extent.

2753. And would it not be very difficult, if he were appointed Commissioner, to avoid the impression that the British Government was officially participating?—The depends. The Consul is allowed to do other work besides Government work, is he not, abroad?

2754. That depends rather on the status of the Consul?—He would only be appointed by the exhibition company, not by the Government.

2755. I was thinking of three cases in which the British Foreign Office has nominated the Consul as British Commissioner, while the Government have officially declined to participate; it has been done as a sort of compromise, in fact. I think one witness has told us, or two witnesses have, that the consequence of that was that we were supposed to be officially participating, but the British exhibitors, being left to their own initiative, made rather a poor show, and the British Government got all the discredit?—That was a case in which, I suppose, he was officially appointed by the Foreign Office, but I do not propose that he should be that. I simply propose that the name should be suggested to the exhibition people for themselves to appoint him. If they like to pay him for the job, or if they do not like to, that is all very well, but it will not have anything to do with the British Government, because he takes up other business I understand, at any rate lots of them do, and the Government is not involved in that in any way.

2756. That does not apply to the Consuls in the big towns. I think they are supposed to give their whole time, and are paid an inclusive salary. But the question arises how they could combine looking after an exhibition, which I gather means very continuous work during the months in which it is open, with looking after the interests of British subjects abroad which they have to protect?—That was only a way in which I thought possibly the difficulty might be overcome. But there it is; it wants looking into in my opinion, and is of great importance I think.

Mr. I. H. Hillman.

14 Feb. 1907

2757. Referring again to your suggested committee with a permanent nucleus, that nucleus, I understand, was to be unofficial—that is to say, it was to be composed of people who were not Government people?—That is so, it is to be formed by the society.

2758. Therefore if they received any remuneration the society would give it, I suppose?—Certainly.

2759. Supposing an exhibition was being started and, a Government grant having been given, this committee was over, say, at Paris organising matters with a Commissioner to see that the grant was properly expended—is that not your proposition?—I am not prepared to bind myself to exact details; it is only a suggestion.

2760. Would you make that committee responsible for negotiating with the foreign authorities for space?—Yes.

2761. They would do all that?—They would have to do all that.

2762. And not a Government official?—If the representation of British interests was fostered by the Government, I think then that they should be responsible for the whole thing. As to whether it would be a good plan to appoint a separate man to look after the social functions, of course, that also might be considered.

2763. But they are to have the whole business arrangements?—Yes.

2764. And if they find that the British section is put in an out-of-the-way corner they will have to negotiate with the foreign Government to secure a better site?—Yes.

2765. Do you think it would be at all likely that the manufacturers and intending exhibitors of this country would combine and create such a society?—I believe that is what has been done in France, and it seems to me that it is a very feasible and reasonable thing, if they are interested enough to think that their business is benefited by exhibiting, that they should be prepared to go a step further in order to get the very best results. I believe the best results can be obtained in the way I indicate; better results, at any rate, than by the present arrangement. I am not satisfied with the present arrangement, though, in all probability, speaking personally, if this society is brought about I shall lose.

2766. I think we agree as to the advantages of co-operation. I was only asking whether you thought the attitude of the British manufacturer would be likely to lead to effective co-operation?—I do think so.

2767. Do you think that British manufacturers are likely to combine? Is there at present any organisation among manufacturers which would lend itself to the creation of such machinery as you propose?—Not that I know of, except the employers' federations. Taking it all together, I believe that it would be to their interest to do it. The manufacturers in some businesses are not necessarily unfriendly; on the contrary, as time goes on I think they will have to be more and more in touch with each other in order to face competition from other countries. I think that is to their interest, and that, I fancy, is the way in which things are developing now—I mean in the direction of organisations or rings or understandings between each other. Of course, there is this point, that when they get into very large companies they sometimes cease exhibiting. Take cotton, for instance; now they seldom or never exhibit. Frequently in the past we had Messrs. Clark, of Paisley, but now that they have combined they do not exhibit. We have lost other people in the same way; through their having no competition they do not exhibit any longer.

2768. Have you had any experience as to a point which previous witnesses have mentioned—namely, the difficulty of getting exhibitors to come forward at these big exhibitions?—It is most noticeable in the case of the United States; that is all. Ever since we have been in business the number of exhibitors has increased, and our business has grown all the time in spite of that. After all, the trouble with regard to the United States is that the exhibits have been banged about so much, and that is one reason why I think the exhibits should be all collected and sent together, because then they would get better treatment. They have come back, but they have been astray and they have been neglected, and that is a source of trouble. That is one of the reasons why they will not exhibit in America. Another is partly on account of the tariff perhaps—in fact, they have told me so. But we have had no trouble in getting exhibits for all the other exhibitions, and, as I say, our business has grown. There are more exhibits than formerly. In spite of the trouble of getting them to come in they come all the same—don't they?

2769. Do you find that exhibitors are more keen to go to foreign exhibitions where the British Government is giving a grant?—No, only when they are going to be benefited by the grant themselves. If I can say to them, "Well, your freight will be free" or "Your space will be free," that, of course, is taken into consideration, because with a small manufacturer that sometimes means a considerable sum, does it not?

2770. To the big ones it does not mean so much, does it?—No.

2771. They look much more to the general advertisement?—I should think so.

2772. If they thought it was good for them to go to Paris——?—They would go anyhow.

2773. They would go whether there was a grant or not?—Yes.

2774. Would you say that of a good many people?—Yes, they would not care for a trifle. Then the awards are very useful to them. Exhibitors are very much disappointed if they do not get the awards; there is no doubt about that. The awards are a great assistance to them, even when they get no advantage in any other way by exhibiting; they will sometimes go for the award alone.

2775. (*Sir Isidore Spielmann.*) You are an exhibitor's agent, are you not?—Yes.

2776. Can you tell us how many firms as a rule you represent at these various exhibitions? Take, for instance, the last three—Brussels, Paris, and St. Louis?—In Paris, in 1889, we probably had about 30, and in 1900 we had about 100; so you see the difference. Chicago I am not sure about, but I should say perhaps 50; St. Louis, perhaps 70; then Milan, I suppose, taking them all together, there must have been 60. Milan was not so large as some of them; it was a little different.

2777. Are you representing any firms at the New Zealand Exhibition?—No, we decided not to go there; there was not sufficient in it.

2778. Is it fair to ask you which firms you represent? Can you give us an idea of their standing?—Some of them are very large. There is the United Alkali, for instance, they employ 12,000 hands. Then some of the shipbuilders have 3,000 or 4,000 hands. Many of them are very large houses—the largest of their kind in the world in several instances.

2779. And it serves their purpose, instead of sending a representative of their own, to engage you to look after their interests?—It seems so. They pay us for that.

2780. What exactly do you do for them? I think the committee would like to know what is the work of an exhibitor's agent?—At first we did not have anything to do with freight. We simply received the exhibits by the side of the space. From that they were entirely in our charge until we put them back by the side of the space all ready packed up for return home. So, whatever was done between the point when it arrived and the point when it departed, we did that—everything. Afterwards we found that they preferred us to give them an inclusive price from the moment it left their warehouse door till it came back to their warehouse door again. Now I give almost invariably a price which will cover everything—insurance, freight, and everything else—and I either return their goods on to their door, or I pay them the money for it.

2781. While the exhibition is in progress, do you take orders for them?—If we can obtain them.

2782. Do you try to get orders?—Yes.

2783. And you do business?—Yes.

2784. As regards the awards, do you represent the merits of the exhibits to the jury?—Yes. We represent the firms before the jury as the accredited representative of the firm.

2785. And I suppose you fight for the highest awards you can obtain?—Yes. You can rely on us for that,

because that is a very vital point with them. They are very keen about that.

2786. Do you find as a rule that the exhibitors like being represented by such a firm as your own?—Yes.

2787. Have you represented the same firms over and over again at the various exhibitions?—Yes.

2788. Do you find that any of them drop out?—We have had many of them from the beginning, but they do drop out.

2789. Are there firms who, once having exhibited with you, go in with you at other exhibitions as a matter of course?—Yes, we have had them sometimes fifteen times following. We have had many of them repeatedly.

2790. And at all kinds of exhibitions?—Yes. There are firms who have frequently in the past, I believe, abstained from exhibiting because they could not get a decent representative, and they did not like to go to the expense of sending a man of their own. They have told me that. That has been the reason why some did not exhibit, I know.

2791. You have worked under the control of Royal Commissions and the London Chamber of Commerce, I suppose?—Yes.

2792. You have told us what you do not like about Royal Commissions; do you find the management under the London Chamber of Commerce more satisfactory?—I really must say I think they are more approachable. I am not speaking from the point of view of the exhibitor, but as an agent only. I have frequently had very insolent treatment from members of Royal Commissions, and entirely without any reason for it. With regard to the Chamber of Commerce, I am bound to say that they have been more amenable. Mr. Serena—though I am not here to speak for Mr. Serena any more than for anybody else—has always been approachable. He has always been willing to receive me without keeping me waiting a long time or having a lot of formalities. With a Royal Commission, there has always been too much formality, and, as I have said before, the individual members of the Commission, though they may be excellent fellows, seem to have no initiative and no power to push out and take advantage of a fact and say, "Yes, we will do it." They must follow the line, and that line is not often the best line. They might have taken into consideration the special circumstances of the case and said, "Well, we know it is a little irregular, but it is evidently to our advantage, and we will do this," or "We will not do this." I should like to give you a case, if I am not taking up too much time, and I will mention a name so that there may be no secret about it. It is Messrs. Wenger's, Limited. They are manufacturers of paints and the covering material for pottery—glaze. In St. Louis they had a very nice exhibit. You should understand that they are not potters, but that they are only manufacturers of paints and glazes for potters to use. Therefore, they have no pottery of their own manufacture, and for exhibition purposes they simply had to get others. In order to show what they can do, they obtained specimens from a great many of the leading houses in France, England, Germany, Switzerland, and other countries also, to my knowledge—from quite a number of countries. They got different examples of pottery, not made by Wenger's, but made with Wenger's materials as regards the paint and the glaze. We exhibited those in two or three cases. Their American agents in St. Louis were very anxious to show that Wenger's glazes and paints were useful, and could be employed by American potters just as well as they could be employed by European potters. So they asked permission through us to place a small case containing American pottery, but made with Wenger's glaze and paints, in the section. Now I approached the officer who had to deal with that, and he at first refused.

2793. (*Mr. Wilson Fox.*) Who was he?—Mr. Lloyd. Then afterwards I approached him again, hoping he would perhaps feel more agreeable or willing and able to do it. He consented. A case was duly sent down and put into its place with American pottery in it. Would you believe it? He made us take that exhibit right away again on the ground that it was not English pottery. But in the other cases which we had sent from England, and which were installed a month or two before, there still remained pottery from almost every country in the world, and none of it was manufactured by Wenger, because he is not a pottery-maker. Yet he compelled me to take away that case of American pottery of which the colours and the glazes were supplied by Wenger. I was so struck by that—it seemed to me such an extraordinary case—that I appealed direct to the Commissioner, but the Commissioner upheld his ruling.

2794. (*Chairman.*) I suppose that was in accordance with the rules of the exhibition, was it not, and that they followed the letter of the rules under which the exhibition was held?—If that was the case, why were not the other things thrown out, too—because almost the whole of the exhibit was composed of similar things.

2795. Perhaps it did not appear anywhere that those other exhibits were from foreign countries; perhaps it looked as if they were all English?—I told them. I said, "In that case, you must throw the others out."

2796. It did not appear when you put in the other exhibits, perhaps?—No, it did not appear.

2797. I agree with you that it seems perfectly absurd?—It is indefensible.

2798. (*Mr. Wilson Fox.*) Your point is that it would have been to the advantage of British-made paints and glazes to have shown that they could have been utilised on American goods?—Certainly; that was just the point; that is all it was meant for.

2799. (*Sir Isidore Spielmann.*) It was exhibited for the glaze and not for the object?—Not for the object, certainly, but for the glaze and the paints.

2800. Perhaps the Americans did not like it?—There was nothing at all to show that it was used by Americans, only if Americans came round and said, "Yes, it is all very well, I daresay, they are good glazes, but they would not apply to our pottery." Then I could easily take out the American specimens and say, "Look here, turn it up, there is your American mark, and you see they have been using our glazes," just as I could with a Frenchman or a Swiss or a Dane, because I had examples from all those countries which I could produce, and which I did produce, to show them that it could be used for their pottery.

2801. To go to another subject, you represent manufacturers as a rule, do you not?—Yes, and inventors.

2802. Do you find any difficulty in getting the manufacturers to exhibit? We have been told by previous witnesses that manufacturers' agents—and I do not use the word "agent" in the sense used by you—sometimes prevent manufacturers appearing at exhibitions?—My experience is generally the contrary. They have frequently said to me, "We do not want to exhibit, but our agent wants us to do so. I suppose we must go, but we would rather not." I can assure you that is frequently the case, though it seems to be just the contrary of what you say.

2803. Can you give us any examples where the agents have wished their manufacturers to exhibit?—Yes. I have known many cases in which they have said to me, "We do not want to exhibit, but our agent asked us to exhibit."

2904. Are you usually satisfied with the spaces which are given to the firms you represent at the various exhibitions?—Do you mean with the individual spaces or the space for the whole British section?

2805. I should say rather with the positions that are given. Are you satisfied with the positions that are given to individual exhibitors?—You are not asking as regards the position of the whole section?

2806. No?—Yes, I am; but I wish to temper that by saying what I said before, that the best use is not made as far as the grouping and arrangement of the exhibits go. The positions are all right, so far; but they have not been nicely arranged—that is to say, an exhibit has been placed in the front with a blank wall behind it, and therefore it hides the other exhibits.

2807. We understood what you told us just now about that. Who is to blame for it? Who is it who allots to you the various positions for the various firms you represent?—The Commissioners.

2808. But who in the Commission?—That depends each time; it is a different officer very often.

2809. Take the Paris Exhibition of 1900?—I cannot answer that question, really.

Mr. I. H. Hillman.

14 Feb. 1907.

2810. I should like to ask you what was your opinion of the British Section at Liège?—It was a very poor one indeed; it was very badly placed, and very unfairly rearranged as regards passages and spaces.

2811. (*Mr. Harris.*) I would first take you to a phrase which was introduced by the Chairman, "private enterprise," but in rather a different sense; and I will ask you whether you do not think that perhaps the good results to British trade which come from exhibitions could really be better attained by such methods of private enterprise as advertising, commercial travellers, and so forth?—Yes, perhaps they might. But then they would in that case lose the benefit of the award, would they not? There would be no awards, which they think have a good effect. The value of an award which is in my mind is this—it shows the public that the man who is prepared to come to an exhibition and exhibit his goods is desirous of being in front, and says, in effect, "I face the world; my things are good, and I like them to be under the severest test." From that point of view an award is of service, because it shows that a trader is pushing and go-ahead, and wishes to be up to date. If there were no exhibitions they would not have that advantage of being able to advertise, "Gold medal, Paris."

2812. When you say that shows the public what a man is prepared to do, what public are you thinking of?—The man in the street—the purchaser.

2813. In this country or abroad?—Both, for things are sold abroad. They are often stamped, are they not, "Paris Gold Medal," so-and-so?

2814. Is it your experience that as a rule sales abroad do follow the exhibitions?—No, not so much as some people might think—not directly, but indirectly they do. I have been told by manufacturers that years afterwards they have had an inquiry from some one who has picked up an old catalogue of an exhibition, perhaps in Australia, and has sent on an inquiry from that.

2815. Do you draw any distinction between exhibitions in foreign countries and exhibitions in our colonies from the point of view of the advantage to the British trader?—No. I think that they have a chance of benefiting by exhibiting in foreign countries as well as in England.

2816. In referring to the Colonies I think you said you have not persuaded any firms to go to New Zealand, did you not?—We seriously thought of taking it up, but when we found that the people here in Victoria Street, the Commissioner, seemed to know very little about it, and could not make any definite arrangement with us, we let it go—not because at that time we were doubtful whether we could get a sufficient number of people to go, because I believe we might have obtained sufficient; but as they could not make any definite arrangements with us, and their terms did not seem satisfactory, we let it drop. We might have induced enough exhibitors to go; but as a matter of fact I think very few have gone.

2817. You cannot say now whether that is to be regretted or not?—I think we are very well out of it—from our point of view I am sure; I know that now.

2818. Do you put down that failure on the part of the Agent-General to give you information as another instance of officialism?—No. In this case I may tell you that we did the work of the construction for the New Zealand people almost entirely in St. Louis, and therefore I got into touch with the Commissioner there and made overtures to him which I think he was willing to accept himself, but which he felt he could not do without sanction, and as that sanction did not come over in time, as I say, we let the matter drop.

2819. Did it as a matter of fact come later, do you know?—It came, but it was not quite satisfactory. We asked that we might be the exclusive agents, as being a small exhibition we could not make it pay unless we had all that there was to go. They were not quite disposed to give us that, and we found that if others came in we could not make anything out of it. I am very glad we did not go. That is the whole of the story.

2820. I want to ask you a question about your idea of a committee of merchants as the best method of organising exhibitions. Do you not think that under such a committee there is a danger of trade jealousy, so that the small trader perhaps may be cut out?—I think I have indicated how that would be obviated, and that is by allowing any manufacturer or any inventor at a very nominal fee to become a member, and therefore he could personally influence the determination one way or the other. I do not think that they should or that they could refuse anything like a legitimate exhibit. I should think it might come out all right. At present you know sometimes people are refused space without any definite reason being given. They simply say and they have said, "We have not any space," or "We regret to say that we cannot allocate you space," when in all probability there is a great deal of space, but they had other reasons for not desiring this particular exhibitor.

2821. One question as regards awards; you have indicated that the awards are not necessarily given according to the simple quality of the goods?—That is so.

2822. Do you not think that if the British manufacturer really understood that, he would say, "I do not want any more awards; I will stand out of exhibitions altogether"?—No, he would not, because, as I say, though I myself would take no notice of a thing because it is marked as having won a gold medal, though I would not regard that as being any indication of a guarantee that it is better than anybody else's goods, I am influenced by the fact, and I am quite sure the man in the street is also influenced by the fact that the trader in question has a gold medal, because it shows that he is pushful, and that he is up to date.

2823. If it is the firm with a name which gets the award, as a rule, can you justify a grant of public money which really is a sort of subsidy towards pushing the trade of those firms?—From the point of view of the taxpayer I certainly disagree with any grant being made, because, as I think I remarked to the Chairman just now, it gives one manufacturer an advertisement at the expense perhaps of a competitor. From that point of view I am quite opposed to the granting of any public money.

2824. (*Mr. Wilson Fox.*) In collecting these exhibits from exhibitors, which I understand you do, is there any censorship of the character of those exhibits by the body which is promoting the exhibition or by the Royal Commission?—I presume so. A Royal Commission would not accept an exhibit unless they were satisfied that it was a product manufactured by the firm in question.

2825. Have you ever had one refused that you have been endeavouring to take abroad for somebody else?—Yes, we have had some refused.

2826. Have you gone and laid the case before the Commission and endeavoured to get it done through them?—Till quite recently the Commission ignored us, and they would not have any dealings with us as agents. But that has not been the case now for the last two or three exhibitions. At the last Paris Exhibition and at the St. Louis we have had more consideration from that point of view than we had before.

2827. Have you ever known a case where the Commissioner said "This exhibit is not good enough," and the firm or company interested have improved that exhibit, and ultimately sent it out?—Yes, I have known cases where they have improved it, and I have known cases where they have taken it away altogether after installation.

2828. Are you satisfied that there is a sufficient censorship of the exhibits by the people who promote them to secure that at any rate fairly good and reputable exhibits are sent out from this country?—When it is participated in by a Royal Commission I think so.

2829. You are satisfied of that—I only want to get your view?—Yes, but I am not satisfied with the general *tout ensemble*, the general arrangement and effect of the whole. That is a very vital point.

2830. You said that a representative traders' committee should be appointed, I think?—No, not a traders' committee.

2831. Then a representative manufacturers' committee?—Yes.

2832. You also said that you think a Commissioner might be appointed by the Government to do the social part of the work at the exhibition?—Yes.

2833. But who is going to do the practical work at the exhibition which has hitherto been done by the British Commissioner, as to finding the space, being

generally responsible for the place, and so on?—That I propose should be done by the society which might be organised.

2834. But these manufacturers cannot go out there and do it themselves?—No.

2835. I want to know who would be responsible for the credit and for the arrangement of the British exhibit, say in Paris, under such an arrangement as that?—The directors of a railway company do not individually see to the working of a railroad, I take it; and in this case, I suppose, the nominees of the society would have to be responsible, each in his department

2836. There must be a head man, must there not?—Yes, there must be.

2837. Do you contemplate that this manufacturers' committee should appoint a person who would act as Sir Herbert Jekyll and Sir Charles Watson and other gentlemen have acted in the past?—Yes, I should think that probably would be the best way.

2838. I am only trying to elicit your opinion. Do you think that a gentleman nominated by a manufacturers' association would be able to run an exhibition with credit from the Imperial point of view as well as a gentleman nominated by a Royal Commission could?—I certainly do, and I should think better, because, however able these men may be who have been appointed in the past, they were not, if I am rightly informed, quite the kind of men. I am only expressing my view on what I have noticed, and I may be incorrect, but from my point of view I should say that however able, and however good, and however capable men they were, they were not quite the kind of men, because they had not had previous experience. You cannot expect an officer of the Army, for instance—though I am not pointing to any individual, but let us take that, or an officer in the Navy, if you like. How can you expect a commander in the Navy to have knowledge and grasp enough to go out to a country and to have the arranging and getting up and the planning of commercial exhibits? It is unreasonable, I think, to ask him to do so.

2839. I am only asking these questions because we have not got precisely on the notes who you propose should run the exhibitions under your suggestion. Are we to gather that you would put in charge of the British exhibit in a foreign country somebody who had been accustomed to business?—Certainly.

2840. And, of course, you would agree that, besides being a business man, he should have a great deal of both *savoir faire* and tact in dealing with the foreigner?—Yes.

2841. He would also, I assume, have to know the language of the country in which the exhibition is being held?—It would be very nice for him to do so.

2842. It would be essential, would it not?—Not absolutely. We have had a case recently where the Acting-Commissioner did not know the language, and I have known cases before. But it would certainly be to his advantage.

2843. Would you agree that a man with all these qualifications—*savoir faire*, business knowledge, and sufficient knowledge of men to enable him to deal with all classes of men—would be a difficult man to find?—I do not know. I should say we need not trouble about that. I think the man can be forthcoming. I think there are such men. Not every Tom, Dick, and Harry would be suitable for the job, but no doubt we could get men.

2844. Now as to the representative manufacturers' committee, a great deal depends upon your word "representative," does it not?—Yes.

2845. Do you think it would be difficult to get up a representative manufacturers' committee which would be looked upon by the big traders and big manufacturers of this country in that light?—I do not think that is impossible. I think it might be done. I think English manufacturers and Englishmen generally are quite capable of putting the men forward and of selecting a committee which might very well be accepted as a very fair committee.

2846. Would they combine for it?—Yes, I think they would.

2847. Supposing an association was got up in London, you would agree, I expect, that it would be a disastrous thing if the great manufacturers in the North of England and in Scotland did not join?—Yes, they should be all in, no doubt. I should like to see them thoroughly representative of Great Britain.

2848. If they did not join they might not like being under the control of an organisation of this character?—They could always join if they did not like that. They would say, "Look here, we are out of this; let us join in it, and then we shall have a voice in the future." The thing rests with themselves.

2849. Is there not a nucleus or an organisation somewhat on these lines already in working order? Are not the Associated Chambers of Commerce supposed to be representative of the traders of this country?—Yes, I am not thoroughly up to just what their position is, but it might be so arranged that it could be worked in conjunction with them. I have not come here with a definite scheme laid down in all its details. It is more a suggestion that I am thinking of.

2850. I want to put this consideration to you, that unless you get what you call a representative committee it might be less agreeable to many of the manufacturers and traders of this country than a Royal Commission which would create no trade jealousies, whatever other drawbacks might attach to it?—Of course, there is that point of view; but the tendency in Royal Commissions I find is to be too exclusive. They do not meet you in any way. I am not speaking now of individuals. They do not meet the exhibitor. I have seen the exhibitor practically kicked out of office—not a poor agent, but an exhibitor—kicked out. They do not meet them in a spirit of fellow-feeling. They seem to look upon them as intruders. That is the worst of anything like a Royal Commission, that they are too exclusive, and they do not join hands. There is no sympathetic working or sympathetic joint endeavour to get the thing along. They stand at their place, and in effect say, "If I say 'Yes' I shall be committing myself"; and they won't say "Yes."

2851. I am not prejudiced one way or the other; I only want to get your view as to what you think is best. Would you say that there is some danger in a trade organisation of some trade jealousy?—No, I should rather think there would not be.

2852. Among the traders themselves, I mean?—No. I should think that more and more the tendency is to put aside any feeling of jealousy and to work together, because now it seems to me much more than formerly that it is not a question of individuals so much as of nations, and that they will be forced to act together in order to meet the competition of other nations.

2853. That, of course, is a broad view to take; but do you think that has percolated down to the individual trader yet? Does he look upon his industry from the national point of view, or does he look upon it still from the personal point of view?—Not from the national point of view, but it will be to his personal interest to support the national point of view, though of course he will still fight for his own hand, I suppose. He will find that it is more to his interest, I think, to join with his fellows rather than be in opposition to them, so that he may meet the foreign competition.

2854. You would like some organisation which is the least violent to the exhibition agents?—No. As I say, I have tried to put myself out of it, because I think very likely, if this society that I would like to see made were established, I should be out of work. But that does not signify. I try to look at it from the broad point of view that if we are going to do the thing we might as well do it as well as it possibly can be done.

2855. That brings me to this question; You have been to a very large number of these exhibitions, and have had a great experience. Looking at the British commercial exhibits only, do you think, on the whole, that as a rule they compare favourably with the foreign commercial exhibits or not?—I think they do. In material and in value for money I think probably they are ahead very often; but they are not arranged and placed so as to make the most effective impression.

2856. They do not give to the public the idea that they are as good; is that your point?—That is it; the public is not affected favourably anything like as much as it should be, and could be, if the things were properly arranged and properly dealt with.

2857. And you would in the future leave that arrangement to some organisation, whatever it might be?—Yes. The exhibits, to be effective, must be dealt with collectively as a whole; but I do not want to take away the individuality of an exhibitor, because

Mr. I. H. Hillman.

14 Feb. 1907.

that is just where we shall tumble the other way if we do that.

2858. I quite see that. At the present moment you get the spaces offered you, and you go over there, and you put up some show-cases or some little building in which you show the exhibit of a particular manufacturer. Would you be satisfied in the future, and would the manufacturer and the trader be satisfied, if you went over and found everything arranged for you—the space allotted to you, and the little building in which the exhibit was to be shown all put up, and you had nothing to do but to simply go and unpack the goods and put them up? Would you be satisfied in having that arrangement carried out for you?—I think that the exhibitor would be, as I say, providing he had a voice, or could have a voice, in the arranging of the space and other conditions in advance, as he would have under my proposal.

2859. But would he? If the organisation wanted to improve the general aspect of the whole British exhibit, might they not suggest that they could choose the space better for you, and also give you a uniform class of buildings throughout?—Yes, I understand.

2860. Would that be objectionable to you?—I do not think so, because the individual exhibitor would have a voice in this if he cared to become a member of the association.

2861. One witness came here and said that he would view with regret any suggestion that individual exhibitors should not put up their own particular building or their own particular case in which they showed their exhibits?—I should like to permit the individual exhibitors to maintain their individuality to the farthest possible extent, so that if they wished to have their own installation they could do so; but it should be brought into harmony with the others within a reasonable extent, and not allowed to be thrown up anyhow, and to be one colour here, another colour there, or twenty colours.

2862. You would have to put yourself under a certain amount of control, though?—Yes, and you do that when you enter into any commercial engagement; or when you go to an exhibition as it is now you are under control.

2863. But you think there could be more control, and yet the trader or the manufacturer could be given a fairly free hand or some voice in it?—Yes, I think it could be done.

2864. You said that there are indirect orders, owing to the fact that an exhibit has been sent to a foreign exhibition, but you cannot calculate the amount?—No, it would be difficult to do that.

2865. Do you think, upon the whole, that it pays the people for whom you have acted, from the export point of view, as increasing their foreign trade, to show at these exhibitions?—I think that is so in some cases, but not in all. There are some exhibits which are made which have often seemed to me quite useless; but then, as I say, there are many factors which have to be considered. You have to find things out before you can determine why such-and-such an exhibit is sent, even if it appears that there is no advantage. For instance, they frequently go to oblige other people, or they go perhaps to oblige a society in London. There are many ways in which exhibits are got in.

2866. Do they go sometimes because their chief competitor goes, and they dare not stop away?—Yes, they do sometimes go on that account.

2867. On account of the foreign trade?—They sometimes go on account of their home competitor.

2868. And because they are afraid that their chief competitor will get the foreign trade instead of them?—That is another reason for their going.

2869. Do they go also because they are afraid that their chief competitor will get a medal for home consumption here?—Yes, I think that also comes in frequently.

2870. Take a trade where there are one or two leading firms, and assume they agree not to go——?—They do sometimes make that agreement, I know; that has been done.

2871. I wanted to get at that; they do make that agreement?—Yes, I know they do.

2872. (*Sir Isidore Spielmann.*) We have been told that at some of these exhibitions, especially at the last Milan Exhibition, there were a good many firms in the English section selling what is called trash. Were any such firms among your exhibitors?—No; absolutely none—not one.

2873. You know the kind of firm I mean?—Yes; what we call fakers, though I do not know where the term came from. I have never heard it defined, but the definition I have often felt to be is this—a faker is a person who sells something which he does not manufacture, and which is not a genuine article. That is, in my opinion, the definition of a faker—a man who sells something which he does not make, and which is something that is not a genuine product.

2874. (*Mr. Harris.*) What do you mean by something that is not a genuine product? Do you mean, *e.g.*, brass for gold?—Yes, sometimes that, and so on.

2875. (*Sir Isidore Spielmann.*) But you do not take such exhibits?—We have never had anything to do with those. There was one point which I think I should like to mention, and that is at one exhibition which I attended a certain statement was made in the public Press which just shows you how careful we should be in the appointment of Commissioner, especially where the Government gives no grant; this is touching on my suggestion just now. In this case the Commissioner stated at a public dinner, I believe, so far as I understood the report, which I think I read myself in the paper, and I was present and saw what the effect of it was in the section—that owing to a rearrangement which added very much to the effect of the section he was able to add, probably, I think it was 2,000 square feet additional space. Now that was done in this way: I know my facts, because I was there and saw the whole thing. First of all, the space was planned out in London, and an exhibitor comes and takes a space, say it is a corner space—that is, with a passage *this* way, and a passage *that* way, on the understanding that the passage shall be, say, 8 feet wide *here* and 8 feet wide *there*—and he pays perhaps £50 for that space. The passage is shown as running right clean through the exhibition; it is a main gangway running through two or three other countries' exhibits also. So anyone coming along would naturally arrive at his exhibit, because it was in the main gangway. When the exhibitor arrived, he found, instead of the passage being 8 feet wide, it had been reduced perhaps to 6 feet, let us say, and instead of it being a corner space with a passage on each side, there was only one passage. This exhibitor perhaps had paid £50 for that space, and I can imagine that he might feel he had been swindled. On that occasion the Commissioner in question had simply reduced the passages, and obtained the space in that way. He had done away with other passages, and, what is more, rather than pay a proportion (at the suggestion of a neighbouring nation), which was very small, towards a little decoration of the division between the two, he preferred to allow that passage to be boarded up. So you see the exhibitor was wronged in two ways, or three ways. His passage was made narrower, one passage was taken away, and a passage which should have connected through into the other sections, and therefore ensured to him a goodly number of people passing his stand, was done away with altogether, and the British section on that occasion was, so to speak, shut up in a corner.

2876. At what exhibition was that?—If this evidence is to be published, I think I will leave you to find that out for yourselves.

Mr. Joseph Henry Cundall, called and examined.

Mr. J. H Cundall.

2877. (*Chairman.*) What is your profession?—I am a civil engineer.

2878. But I believe you have had great experience of foreign international exhibitions?—Yes, I have.

2879. What exhibitions have you been connected with?—I have been connected with the four Paris Exhibitions of 1867, 1878, 1889, 1900; then with the Vienna Exhibition in 1873, the Philadelphia Exhibition in 1876, the St. Louis Exhibition in 1904, and I am just home from the Milan Exhibition of last year. Besides that, I have had various experiences in refer-

once to the long series of exhibitions at South Kensington, and in reference to some provincial exhibitions.

2880. Were the provincial exhibitions you were at those of Manchester and Glasgow?—No. I was at Cardiff and at Wolverhampton. I had nothing to do with Glasgow.

2881. What opinion have you formed as to the effect of foreign international exhibitions?—That is rather a difficult question to answer.

2882. Have these exhibitions been helpful or the reverse?—They are certainly helpful in my opinion.

2883. What particular classes of industry have had most benefit from them do you think?—So much depends upon the country where the exhibition is held. If I might take the last instance I have had—Italy—undoubtedly textile machinery and agricultural machinery?—Yes; I am speaking of the exhibits from

2884. That is British textile and agricultural machinery?—Yes; I am speaking of the exhibits from this country.

2885. Do you know of any industry which has been adversely affected by exhibitions?—No, I cannot say that I do.

2886. Do you think that the direct commercial results obtained by our participating officially have been such as to warrant the Government in giving grants for the organisation of British exhibits in future?—Yes, certainly. Other countries do it, and it hardly seems possible that Great Britain should be left out.

2887. Could it not have been done in the past by private enterprise quite as well?—We would have been very much worse off than we have been lately if it had been done by private enterprise. The other countries spend so much more than we do in nearly every case.

2888. Do you think that before a Government grant is given any condition should be laid down about getting good accommodation at the exhibition?—Yes. That is where we very often lose a great deal, because the Government grants have been made so late that other countries get the pick and choice of positions and other matters before we do.

2889. I was putting the question rather in another way—namely, whether you thought that the Government should not agree to give any grant till we knew that there was going to be plenty of accommodation given to us, and that plenty of people here would exhibit. Do you think the Government grant should be given a long time beforehand, without any conditions being specified?—I would not say that the whole grant should be, but there should be some grant, so that some inquiries could be made, because it takes some time to ascertain what can be done.

2890. You have been connected with so many exhibitions that you must have seen various kinds of organisations?—Yes, I have.

2891. You have had Royal Commissions for most of the exhibitions to which your experience relates, I suppose?—Yes.

2892. Do you approve of a Royal Commission as the best organisation?—I think it is the only organisation that will really work.

2893. Have you been connected with any other form of organisation?—The last exhibition—Milan—was not under a Royal Commission, as you perhaps know; it was under a so-called commission formed by the London Chamber of Commerce.

2894. How did that compare with the others in your experience?—The members of Chambers of Commerce do nothing at all; whereas the members of the Royal Commission, I have always found, when they were on committees, worked and helped matters forward; whereas, as I say, the Chambers of Commerce scarcely do anything.

2895. But they are more business-like men, are they not?—That is entirely a matter of opinion.

2896. I want your opinion. In your opinion, were they not good business men?—They may attend to their own business.

2897. Do you know anything about the organisations adopted by foreign countries for dealing with exhibitions?—Yes.

2898. I suppose you have noticed those in your experience?—Yes. The French have a permanent office connected with the Ministry of Commerce, and then they have a separate organisation, which is a trade organisation or association.

2899. We have had that explained to us; I only want to know your opinion on the French organisation. Do you like it?—The French organisation goes to a certain point. It does not embrace every trade by a long way; it is more confined to Paris and the small manufacturers of Paris, and it does not take the outside.

2900. I suppose it touches Lyons, does it not?—It may take silk textures, because they are more intimately connected with Paris than with anywhere else; but the engineering firms, the cloth manufacturers, and the pottery people, none of them belong to that association.

2901. Would it take in Roubaix and the woollen industry?—Yes, I think it would, but not cotton—that is a small industry, you see, in France.

2902. You do not think it takes in the whole of France?—No, not by a long way. I suppose they would let them join the association if they wished to, but as a matter of fact, they have not joined.

2903. What do you say about the German system?—The German system is purely a Government system, and it is attached to their Foreign Office. They work it through their consular service a great deal. At St. Louis they had their Consul as their vice-commissioner, and in Milan their Consul-General was their chief commissioner. It seemed to act very well indeed. By using their consul they know exactly what the trade of the country is, and they are able to canvas manufacturers in that trade.

2904. So far as you have had experience, do you think they get hold of representative people?—Yes, undoubtedly. Besides that, the consul, as he is living on the spot, is able to make better terms with those in authority at the exhibition than strangers would be, and then consuls find out from one another what is going on.

2905. Are you in favour, then, of appointing the consul of the place at which the exhibition is to be held?—Yes, I think that is a very great advantage.

2906. Where there is no Royal Commission, do you think it would be better to appoint the consul than to have the representative of any particular Chamber of Commerce?—Yes; but then there must be some organisation on this side as well.

2907. And that organisation you would prefer to be the old Royal Commission?—I should, certainly.

2908. In cases where it is not a big enough exhibition to have a Royal Commission, what organisation do you prefer?—I think it is better that the Government should leave it alone, and let manufacturers go on entirely on their own account, if they like.

2909. That would be probably to leave it to the London Chamber of Commerce?—I do not see the good of a small grant at all. For instance, there is an exhibition, I believe, going on at Bordeaux. There is no assistance given, no organisation on this side, and anybody who wishes to exhibit will simply have to apply to the exhibition authorities at Bordeaux.

2910. (*Mr. Malcolm Ramsay.*) I understand that the British Consul has been appointed by the Foreign Office to take charge of British interests in connection with the exhibition at Bordeaux?—I was not aware of that.

2911. (*Chairman.*) To what do you attribute the success or failure of British exhibits in the late exhibitions? I suppose you think that there have been several exhibitions in which we have not been well represented?—Of late years we have not been well represented at any exhibitions scarcely—not as we ought to have been.

2912. Why is that?—I think it is due to apathy on the part of manufacturers here, generally speaking.

2913. Is it that they have got plenty of business besides?—That is what we have been told in the last few years.

2914. Do you think that we could improve the machinery?—I do.

2915. How?—By organising collective exhibits under certain conditions.

2916. Have you ever thought that we ought to have a small permanent organisation?—Yes. I think it would be a very great help indeed to have a small office

Mr. J. H Cundall.

14 Feb. 1907.

were they could obtain the information, which manufacturers desire beforehand, as to the cost of freight, the duties and various other questions which are always being asked.

2917. In the conduct of an exhibition itself you would not make much change, I take it; you think that the relations of a Royal Commission to the exhibitors have been fairly satisfactory?—Yes, except that a Royal Commission of course has to start afresh every time.

2918. Have your relations with the exhibitors, or with the exhibition agents, been of a pleasant description generally?—Yes.

2919. Have you had trouble with them over space?—There are little troubles, of course, constantly occurring, but nothing serious.

2920. Do you think they have generally been satisfied?—Exhibitors are generally satisfied, but the agents grumble occasionally.

2921. Should you say the agents are a grumbling lot?—Yes. Of course, they are just there simply to make what money they can out of it, and if they can get the Commission to do the work it saves them paying for it themselves.

2922. At Paris do you think that our exhibitors were well treated?—I do not think they have any cause for complaint.

2923. As regards awards, do you think that the system of awards is satisfactory?—Generally speaking, I think they are a great deal too liberal.

2924. Could they be done without altogether?—No, because a great many people show something for the purpose of getting an award.

2925. Do you think the awards are fairly conferred?—In most cases undoubtedly they are.

2926. You said you were at St. Louis?—Yes.

2927. Do you think that the pavilion at St. Louis was worth the money spent on it, as an adjunct to the exhibition?—Looking at it from the point of view of what other nations did, I do not see that it would have been possible to do anything else, because the British Government did not spend nearly what Germany did or what France did.

2928. Do you think there is a great advantage in having a beautiful building of that sort?—There is no commercial advantage, but generally for the purpose of upholding the position of England it is necessary to have something like that where others do.

2929. (*Mr. Wilson Fox.*) In your *précis* you say that "if Great Britain is to maintain its position in the commercial world it seems to me to be necessary that its manufacturers should be represented at all large international exhibitions." Has your experience been that a number of the leading manufacturers of this country are not represented?—Certainly. It is very difficult to get the leading manufacturers to come into the later exhibitions, although in the earlier exhibitions we used to get them.

2930. Is that because in the earlier exhibitions they had got their medals and awards, and they were afterwards resting on their laurels?—No, I do not think it is due to that.

2931. What is the reason?—A great deal is due to the system of commerce in this country. Our people appoint foreign agents, and the agents do not like their principals to exhibit.

2932. But that is only the case in certain lines of business, is it not?—You will find that in a good many lines.

2933. But it is not the case where a foreign agent is appointed, and he is pushing a particular manufacturer's or trader's goods by name, that he objects then, is it? Take a big firm which is selling an article of which that firm is practically the monopolist; take, for instance, Colman's mustard. Would not an agent abroad wish to sell that article under its name, and would not the buyer abroad buy it because it was Colman's mustard?—Yes, but that is a speciality. Take cloth, or something that is more general.

2934. I think I know about the textile arrangements. There it is different, because the manufacturer sells his goods to a merchant and the ultimate seller and also the buyer does not know where they have come from?—That is very true.

2935. He might buy them through a middleman and know nothing of the manufacturer?—Yes.

2936. Taking the ordinary manufacturer—taking, say, Maple's furniture, would not people abroad buying furniture prefer to buy Maple's furniture?—Yes, certainly.

2937. Would it not be an advantage to show furniture under a well-known name like Maple's?—Yes, in the case of furniture. But an agent for a firm like Maple's would be agent for that firm only, and he would not be agent for half-a-dozen other makers of similar furniture.

2938. Can you tell me some more lines of goods in which the agent would wish to suppress the name of the maker or would not wish the goods to be shown at an exhibition under the name of the maker?—They do that a great deal in the case of the Sheffield trade.

2939. I believe that is so in the Sheffield trade?—Yes, it is in the cutlery and plated goods.

2940. Are there not many large firms in this country who owe the sale of their goods largely to the name they have made?—Undoubtedly there is a large number of them.

2941. It would pay firms of that sort who have got this reputation to show those goods under their name, would it not?—Of course it would—it must do.

2942. Among that class of manufacturer or trader do you find much reluctance to show?—Yes, of late years.

2943. Do you know why that is the case among that class of person? Is it the expense, or what?—A great deal of it is due to the expense.

2944. But with a firm doing a very large amount of business; for instance, a firm like Mappin and Webb, would a question of £3,000 or £4,000 stand in the way, do you think?—I should not think it would.

2945. Is it because they have got such a great reputation that it is not necessary to go on advertising in this particular form any longer? After all, a foreign exhibition is an advertisement pure and simple, and nothing else?—Yes.

2946. Is it because these firms have made such a big reputation that it is not worth their while to spend money on this particular form of advertisement?—I presume that is it.

2947. You have had a very great deal of experience and been to a large number of exhibitions, and therefore if you will be good enough I want you to give me your opinion as to how you think the British commercial exhibits compared with the foreign commercial exhibits; were they better or worse, or what do you think?—Undoubtedly in most cases the English exhibits are better, but they are not so well shown. There is a want of organisation in our exhibitions which is made very apparent by the way the Fench or the Germans show theirs.

2948. Do you consider the French and the Germans make more of their exhibits?—Yes, a great deal more.

2949. And ours are not shown to the best advantage?—Ours are not.

2950. Is that due to the system of organisation?—Yes, entirely.

2951. I believe you are in favour of a Royal Commission?—Quite.

2952. Would you suggest that the British Commissioners should take more adequate steps to control the manner and the method in which the various exhibits are presented to the public?—Yes, I certainly should.

2953. At the present moment that is not done?—No.

2954. And each exhibitor shows his exhibit, provided it is once passed, in any form he chooses?—Yes.

2955. (*Mr. Harris.*) You stated in one of your answers to the Chairman that the French organisation for exhibitions was partial, and did not touch the whole of the country. Do you think that it fails to do that more than our more, so to speak, haphazard methods?—When the association does not come in, then the Government helps that part of the general trading community.

2956. We have had it in evidence here that if in England you only had a greater element of commercial knowledge upon the committee, leading up to an

exhibition, you would get a better exhibit; is that your opinion?—No.

2957. You would not substitute a commercial commission for a Royal Commission then?—No, I certainly should not. I think a Government Commission is far better, especially if it is composed of people not connected with trade.

2958. Taking a case you referred to, where manufacturers go to an exhibition on their own account, what sort of representative would they have to look after their interests?—They are either obliged to have a local agent or to employ a man specially for it.

2959. But it is done entirely privately?—Yes.

2960. As far as you know, is there any attempt made to convey the idea that it is looked after by some British official?—No, I should think not.

2961. Not as a rule?—No.

2962. You have referred to the apathy of manufacturers; do you think that is due in any respect to the idea that exhibitions do not pay them as a matter of trade?—I presume it is.

2963. Do you think you could bring it down to that, I mean as the actual reason why they do not care to exhibit?—It interferes with their regular business so, that is why they do not like it a great deal.

2964. So that you really have rather to push your manufacturer?—Undoubtedly you must.

2965. Does that not lead up to the idea that you ought not to be spending public money upon forcing people to do what, as a matter of business, they prefer not to do?—Other nations do it, you see, to a greater extent than we do.

2966. You did make some reference to the Milan Exhibition having produced orders in Italy; it had been an advantage to trade, I think you said?—Yes.

2967. Did it produce orders for textile machinery?—The textile machinery people did very well indeed.

2968. In the way of actual direct orders?—Yes.

2969. There was one remark you made about which I was not quite clear. Are you correct in saying that at St. Louis France and Germany spent more on their pavilions than Great Britain? Was it not the case that they put up a much more showy structure at a much less cost?—It certainly was not at less cost. They both of them must have spent much more than we did—considerably. We never got the exact cost of either of them, but it certainly must have been more than ours; Germany I should say was double.

2970. (*Sir Isidore Spielmann.*) I think you said that we did business at the Milan Exhibition in textile machinery and agricultural machinery?—Yes.

2971. Was any business done in any other direction?—I do not think there was.

2972. Had we any other important exhibits there, apart from ship models?—There were some steel exhibits and matters connected with ships, and there were one or two exhibitors there who were more or less coerced by the Italian Government for whom they were carrying out large contracts.

2973. Had we any other heavy machinery there, locomotives, for instance?—No, we had nothing whatever in that way.

2974. Did other countries send them?—Yes, we had a great quantity of locomotives from every other country in Europe except ours, I think.

2975. We used to have a trade in locomotives in Italy, did we not?—Yes. Half of the old locomotives certainly are English, and that would be so again only our locomotive makers will not take orders, or rather will not guarantee delivery.

2976. But other countries did send locomotives?—Every one of them—the Russians, the Belgians, the Germans, and the French.

2977. I have heard it said that locomotives were exhibited there by foreign countries which were destined for Egypt?—Yes. There were four for the Egyptian railways, two German and two Belgian, and they went straight from there to Egypt.

2978. Do you regard the British section at Milan, taken as a whole, as a success?—No, quite the contrary.

2979. What is your opinion of the Government grants to Royal Commissions; are they adequate?—The Royal Commission grants of late years have been fairly adequate, but I think if a little more were given we might do very much better—that is, very much more might be done.

2980. How do ours compare with foreign grants in your experience?—That is a very difficult question to answer, because I shall have to go by hearsay on that.

2981. Take the German grants?—I have tried very hard to find out what the Germans do. There is a grant made to them like that which we have made to our Royal Commissions, but I think I am absolutely correct in saying that their grant is supplemented from the Privy purse. I am sure that that was so in St. Louis, and I believe that it was so in Milan.

2982. Did Germany make a very large display at Milan?—They were the most important of anybody.

2983. Can you tell us who allots space in the British section as a rule at exhibitions? Take Milan, who allotted the space there?—I did.

2984. We had it from a witness here, who had an exhibit of ceramics, I think, that he had as a neighbour a man who was selling trousers-stretchers?—That I had nothing to do with; that was after I left. I had only a little to do with it really. I did the big allotments, and then I left all the rest.

2985. Can you tell us how the fakers came into the British section at Milan—not through your introduction, I am sure?—Absolutely no. I think it was simply through the mode of procedure that they pursued at Milan. They gave anybody who chose to come and pay down half the money demanded for space a receipt for the money and a promise of space—whoever they were or whatever they were; and no proper inquiries were made as to who the people were.

2986. It has been stated here that in the British section there were firms exhibiting who were not even British subjects?—Exactly. There were Armenians, Poles, and all sorts of people.

2987. How could they come in?—In two cases I know of they came in under false names—they used English names.

2988. We have heard a good deal of criticism of Royal Commissions; can you tell us who appointed the Commission at Milan?—The London Chamber of Commerce, I presume.

2989. Would that be the Exhibitions Committee of the London Chamber of Commerce?—I think not; I suppose it was the full body, but I have really never inquired much about it.

2990. Do you know of whom the Commission consisted—were they exhibition experts or manufacturers?—No, certainly not.

2991. Neither?—Neither one nor the other. I do not think any man of them, except Sir Albert Rollit, ever had had anything whatever to do with an exhibition before.

2992. We have been told by exhibitors that they have not received proper treatment and politeness from the officials of Royal Commissions. I think you did answer that question in the beginning of your evidence, but is it perhaps a fact that exhibitors sometimes are a little exacting and bring such treatment upon themselves?—Absolutely. It is not the exhibitors themselves, but it is their agents who are always the trouble. I never remember a case of a manufacturer ever having any trouble.

2993. Did I understand you to say that when such friction occurs it is very often because the agent tries to make the Royal Commission do and pay for what he has himself undertaken to do and pay?—Yes, exactly so.

2994. (*Mr. Wilson Fox.*) When you see an agent you generally look out for squalls?—We expect it.

2995. (*Mr. Malcolm Ramsay.*) May I press you a little about the extent to which you consider the public should pay for participating in exhibitions? You say the earlier exhibitions were undoubtedly a help to commercial relations, and later ones also, but to a lesser degree; in saying that, are you considering the general effect on the trade of the country or the benefits which accrue to individual exhibitors?—The general effect on the trade of the country.

2996. As concerns the individual, I gather from your previous answers that you consider that the

Mr. J. H. Cundall.

14 Feb. 1907.

benefits are very unequally distributed?—Yes, they must be.

2997. There are some trades in the country which get very little direct and even indirect benefit out of exhibitions, is that not so?—Yes.

2998. But there are others for which exhibitions are a very convenient form of advertisement?—Yes.

2999. Do you think that we could justify the expenditure of public money on exhibitions so far as regards the individual? May you not be running a danger of subsidising the individual firm, or of giving one trader an advantage which another trader cannot have?—No. When you subsidise a particular trade you have to be very particular about giving everybody an equal chance.

3000. Can you give everybody an equal chance by the means of exhibitions?—I do not see why you should not be able to do that.

3001. If you were to try to do so, would you not have to go to every exhibition wherever it may be held, or at least to a great many more than we have been in the habit of going to?—I think not. I do not think the small exhibitions do any good whatever.

3002. Then you would confine it to the larger ones, would you?—I would confine it to the big international exhibitions.

3003. But you think even there you could distribute the benefits more evenly?—I think so, especially if we had a permanent organisation, and it was known through the various trades. We should then find that there would be very much less difficulty than there is now.

3004. What would you call the big international exhibitions? Would you include the exhibitions held at the smaller capitals and cities like Brussels and Antwerp?—I suppose you would have to include Brussels.

3005. Would that not involve ultimately a very large expenditure?—They do not come very often.

3006. We had Antwerp in 1894, Brussels in 1897, Paris in 1900, and St. Louis in 1904—practically they came at intervals of two or three years. I put it to you that the danger is that by going into these exhibitions wholesale we may accumulate a very considerable burden of which you, as a taxpayer, will have to bear part, and of which the direct commercial benefits are very doubtful?—Yes, that is true.

3007. Is that an unfair way of putting it?—No, it is quite a fair way to put it. It certainly wants discretion if the Government is going to do anything at all.

3008. You would discriminate?—I would discriminate.

3009. Would you confine your efforts to the largest exhibitions?—Yes, to those that are under Government patronage or the patronage of the king of the country, or the president if it is a republic.

3010. Would you abstain altogether from the smaller ones?—I would certainly.

3011. (*Mr. Wilson Fox.*) Upon this question of the allotment of space, of which we have heard a good deal, I understand that you had charge of the allotment of space at Milan?—Yes, except that part that Sir Isidore Spielmann referred to; I had nothing whatever to do with that.

3012. I want to ask you this: Do you allot the space after you have got your applications in, and have got the whole planned in your mind?—Yes.

3013. You get all the applications in first?—Yes, you must; you cannot possibly do it otherwise.

3014. It is all allotted on a uniform plan, and you have before you the needs of everybody in the British exhibit who is sending anything?—Yes. May I give a little explanation? On all Royal Commissions we have always had committees of the Commission formed; I made the allotments of space for many exhibitions, but we have always taken care to submit the plan of allotment to the committee, and have made what alterations the committee thought necessary. Very often the committee would know the exhibitors marked on the plan, and would make certain alterations, and I think it is only right that they should.

3015. Do you make any grouping as to trades?—Yes; modern exhibitions are always arranged so.

3016. In allotting the space do you consider at all the excellence of the particular exhibit, or does the name of the firm, no matter what their exhibit is, act as a factor in inducing you to give them better space?—The name of the firm is a guide generally, unless there are any special circumstances which are usually asked for before we begin to allot.

3017. Would it weigh with you whether a firm was a constant exhibitor, and entitled, therefore, to special consideration?—If I knew them as exhibitors, and knew that they would exhibt properly, of course I should be inclined to give them a better space than if I did not know anything of them.

3018. (*Chairman.*) Supposing you have allotted all the space and some very important applicant comes afterwards, have you known cases in which you have managed to save space by diminishing the gangways and walks so as to get more room for the late applicant?—Never to any great extent.

3019. But it has been done?—Yes, it has been done.

3020. I suppose you have had complaints from the people?—No, I do not think I have ever known complaint about it, because we generally take very great care to give plenty of room.

3021. Supposing you have had a gangway of 8ft. and that is reduced afterwards to 6ft., do not the people on the line of that gangway complain?—I do not think so. We never show them the plan.

3022. (*Mr. Wilson Fox.*) Have you had many complaints from people that they have not been put into the best places?—Yes, constantly.

3023. I suppose anybody not facing a gangway thinks he is in a bad position?—If they are not facing the main avenue they always complain.

3024. (*Chairman.*) My point concerns the great difficulty in giving space when practically it has been all allotted?—We often have to refuse or to decline to take them.

3025. Do you generally refuse, or do you generally try to arrange to squeeze a bit here and there?—Not often. It is generally useless; you cannot do it.

3026. (*Sir Isidore Spielmann.*) At which of these numerous exhibitions that you have been associated with has the British section been most creditable?—At St. Louis, I should think.

3027. There is was the most successful?—Yes.

3028. Were there any other good ones?—Yes, the last Paris Exhibition. I presume you are speaking of the late exhibitions. If you are including the early exhibitions, then I should say that Paris in 1878 was far and away our best year.

3029. May I ask which have been the most discreditable to this country?—I should say our last one—Milan.

3030. You were not associated with Liège, were you?—No, not at all. I have heard enough about it, and I am glad I was not. Liège was hardly an exhibition.

3031. You would say that Paris and St. Louis were the best, and Milan the worst?—Yes.

TENTH DAY.

Thursday, 21st February 1907.

PRESENT:

Sir ALFRED E. BATEMAN, K.C.M.G. (*Chairman*).
Mr. A. WILSON FOX, C.B.
Mr. C. A. HARRIS C.B., C.M.G.
Mr. ALGERNON LAW
Mr. MALCOLM RAMSAY C B

Mr. SIDNEY SPARKES, called in and examined.

Mr. S. Sparkes. 21 Feb. 1907.

3032. (*Chairman.*) Are you a director of Clayton and Shuttleworth, Limited?—Yes, I am.

3033. You have been there for some years, I suppose?—Yes, I have.

3034. Your firm has exhibited at a good many exhibitions abroad, I think?—Yes, we have at a great many; I think we may say at every one since 1850.

3035. That is, I suppose, at all the principal ones?—At all the principal international exhibitions; that is, at all the international exhibitions as understood by the term.

3036. (*Mr. Malcolm Ramsay.*) What is the business of your firm?—We are agricultural engineers.

3037. (*Chairman.*) Your firm has been in business a very long time, I think?—Yes, for a great many years I think we have been in existence for 60 years.

3038. What is the nature of the goods exhibited by you?—Portable steam engines and threshing machines principally.

3039. Have you had any increase of business in foreign countries which you can attribute to these exhibitions?—Yes, undoubtedly.

3040. Have you ever suffered any disadvantage from having your designs copied?—No, except in the sense which I think we have stated in the answers that we sent in to your formal questions. Undoubtedly it has been the case that Continental competitors of ours have copied our designs. There are one or two notorious cases, and I may mention, in particular, Mr. Heinrich Lanz, of Mannheim, who was originally an agent of ours. He severed his connection with us, got capital, set to work and positively took our engines and threshing machines as his patterns; he had them in his yard and copied them. That does not exactly come from exhibiting at an international exhibition; but still, all our competitors go to these exhibitions, and no one is to say them nay if they are there taking notes and measurements of this, that, and the other. We do not mind that. We say we get a *quid pro quo*, and where we lose on the one hand we gain on the other.

3041. I suppose there is much more competition on the Continent in your business now than there used to be 30 or 40 years ago—Much more. That is particularly the case in Germany. The German manufacturers, as I have stated, are our greatest competitors.

3042. On the other hand, I suppose you have extended your sphere of influence, and you sell now more to the less developed countries, such as Roumania and Russia?—Yes, largely.

3043. I suppose you do that a great deal more than you did?—Yes. I may explain that we have a large establishment in Vienna, employing nearly the same number of hands as we employ at Lincoln. That establishment was started some 40 years ago to enable us to compete more readily with German and other manufacturers. We have recently spent between £300,000 and £400,000 in Vienna in building new shops, extending our facilities, and so on, in order still further to meet the competition.

3044. You manufacture in Vienna, then?—Yes, very largely. I am sorry to tell you that we are transferring, to a very large extent, the manufacture of engines and threshing machines from Lincoln to Vienna, in order to overcome the difficulty of the duties and the cost of the sea and land transport from Lincoln to these different countries—Roumania and others. I am touching upon a debatable point, possibly, but this is one of those cases where undoubtedly Lincoln and the Lincoln workmen are suffering from this transference.

3045. That is a very interesting subject, we know, but we are on exhibitions now?—Yes, I am aware of that. I am only touching upon it *en passant*.

3046. Do you attach much value to the awards you have had at exhibitions?—Yes, as you will understand, from an advertising point of view. We advertise then very largely, and we make a very great point of our large medal boards, as they are called. They are somewhat unique in the trade. We have some hundreds of gold and silver medals represented on a board in a frame. The fact that you have taken the Grand Prix here and the Grand Prix there, and that you have come out at the top at any international exhibition, carries weight, and that is a thing to be advertised. In our answers I think we have mentioned particularly the recent exhibition in Milan.

3047. You got a certain amount of business there?—Yes, we did.

3048. And you have done business since?—Yes, there is no doubt about it, that has already been shown.

3049. In your answers you make a very interesting statement, namely, that you are getting business among the Italian farmers in the Argentine; do you attribute that to the Milan Exhibition?—The Milan Exhibition has given a fillip to the business. We have always done a very large business in the Argentine, and in the Argentine there is a very large number of Italian settlers, Italy being very strongly represented in that country, as I daresay you know. The effect of the Milan Exhibition has undoubtedly been noted there; we have seen it.

3050. Have you been induced to buy to a great extent from British or foreign manufacturers owing to their having exhibited goods?—We have bought from British manufacturers, but not from foreign manufacturers; there has not been that amount of—what shall I say—reciprocity. We have bought from British manufacturers as the result of seeing their exhibits in the various exhibitions. Some of these exhibitions may have been held abroad, and our representatives, myself or others, may have been there and may have seen something from our own country which we liked.

3051. But you have not seen foreign exhibits of sufficient value to induce you to buy their machinery and tools for your particular work?—If we except America, no. With regard to America, we have in many instances seen, appreciated, and bought their machinery. We have bought it rather extensively, too—sawing machinery particularly for our saw mills. Then again the Americans turn out a remarkably good lathe—what is called the turret lathe, which they were the first to introduce—and many other things which we certainly find an advantage. Probably we might not have seen or known of those but for attendance at these exhibitions, where it is sometimes the case that these machines are seen in actual operation.

3052. You have sometimes derived instruction from

Mr. S. Sparkes.

21 Feb. 1907.

seeing new and economical methods of manufacture, and so on, I understand?—Yes, that is so.

3053. I gather that you have not refrained from exhibiting at these international exhibitions?—No, we have not.

3054. Still, I presume you think that there might be some improvement of the organisation in connection with these exhibitions?—Yes. We think that we are put to an enormous amount of expense, in which we might fairly be assisted by the Government.

3055. In what way should you like to be assisted?—I do not know that we ask for any pecuniary assistance, but there might in many instances, I think, a little more attention given to us, and we might be covered by the wing, if I may say so, of the British Government. I think there should be a little more attention shown to us at times, and that we should not be left entirely to our own resources, as is frequently the case. We know perfectly well when any international exhibition is coming on that we are communicated with from the department of the Government here, and so on; but, as a rule, you find in the end, when you get over there, that you must paddle your own canoe to a very large extent.

3056. Can you specify any particular exhibitions in which the organisation has been better than ordinarily is the case?—I think I may fairly say that in Milan there was a distinct improvement; that, as you know, is the last international exhibition which has been held. There was undoubtedly a distinct improvement there, one that was appreciated by us very much. If that could be continued I do not know that we should have very much more to complain of or very much more to ask for

3057. Was that as regards the placing of your exhibits?—Yes.

3058. And the arrangements for transport?—Quite so. I am also thinking of the general attention which was shown to us. Any little matter which we thought required attention was immediately taken up by those who were responsible, and we found that there was a desire to give attention to us more manifest than it has ever been before.

3059. What was your experience in Paris in 1900?—In Paris in 1900 things were not so good as they were in Milan in 1906, but still, even there, there was an improvement as compared with previous experiences.

3060. Have you formed any idea about the value of a Royal Commission as compared with management by private bodies, such as the London Chamber of Commerce?—No, I cannot say that I have, and I do not know that I have studied that question. I take your question to be, Do I think that a Royal Commission would be preferable to chambers of commerce?

3061. That is the question?—I think possibly it would be so, and that a Royal Commission would be preferable to the working of chambers of commerce.

3062. You are aware, I suppose, that there is no permanent organisation between exhibition and exhibition, and that everything has to be started afresh for each exhibition?—Yes.

3063. I gather that you would like to see some small permanent nucleus established?—That is it—a department. I think that would be distinctly advantageous.

3064. Have you any ideas as to the proper way in which the mercantile community and the manufacturing community should be got into line and interested in an exhibition when it takes place?—So far as we are concerned, taking our section, I do not think there would be any better way of getting at us than through the Agricultural Engineers' Association, as it is called, which has its office in Coleman Street, in the City. There you will find a secretary and council, and everything affecting our trade of agricultural engineers is brought before this Association, and is dealt with. We are all members of it, and we meet from time to time to discuss various things, and even in connection with these exhibitions it is frequently a matter arranged between us. We say: "There is an exhibition coming on at Milan; what shall we do? Shall we go or abstain? What is the feeling? What do you think?" One man will say, "Are you going?" Another man, "We cannot afford to be out of it." The thing is discussed pro and con.; and, as a rule, we arrive at a settlement of the question, and decide that we will or we will not, as the case may be—as a rule, we decide that we will.

3065. Most of the big firms in your line exhibit, do ey not, such as Aveling and Porter, and the Grantham firm, Richard Hornsby and Sons?—Yes, always.

3066. The Leeds people, John Fowler and Co., do too?—Yes. I think you could not have a better illustration of the general desire of the trade to be well to the front than is found in the agricultural show-yards of this country. Go to any show-yard you like of any local county association, and go through the machinery section of that show-yard, and you will find all these firms that you have named represented there, Aveling's with their road rollers and traction engines, Fowler's the same, Burrell's the same, Hornsby the same, and Clayton and Shuttleworth the same—the whole lot of us, there we are. Every now and then there is a sort of feeling at the end of year that shows are an expensive tem, and that the aggregate cost is something enormous. When you include railway carriage, the expense of attendants and various other matters, you can quite understand it amounts to a very big bill. There is a feeling, shall we go on? I daresay if we could get universal action, and everyone would say he would abstain from exhibiting, there might be a shutting up of the whole affair. But there is a certain amount of rivalry. "Clayton's are going to be there, and we shall have to be there." We, on the other hand, say, "Marshall's of Gainsborough will be there, and we cannot afford to keep away.'

3067. Do you prefer to exhibit at a special show, that is, a show which is only in your goods and similar goods; or at a universal exhibition?—I think we should prefer an exhibition of our own goods only, because, in a sense, that concentrates the attendance, and those who are interested in our goods are those only that we expect to be present. If you have a general exhibition, people who are interested in textile machinery, and this, that, and the other, are there also, and you get an enormous crowd; but you get the peo le you want if you have an agricultural machinery exhibition, such as the Germans are thinking of holding at Düsseldorf—they are going to have a big show there, I think it is in May or June, but I am not quite sure which, and it is to be their Royal Show, corresponding to our Royal Agricultural Society's Show.

3068. Then it is not really an international exhibition?—In a sense it is international, because it is open to the whole world.

3069. Are you exhibiting there?—Yes, we are exhibiting there, but in that instance we are doing it through our German agents. We are not directly represented there, but our engines and machines will be exhibited upon the stands of our various agents in that country.

3070. They will be exhibited under the name of your firm, I suppose?—The name of the firm will be on the machinery as the makers of it, but the sign over the stand will be that of Mayfarth and Co., or Zettelmeyer or whatever may be the agent's name—just as in England you see the big signs in the show-yards—and you are able to say that is a Clayton threshing machine, or a Clayton engine or a Clayton this or that. These exhibitors advertise themselves very freely as the agents for the threshing machines and so on of Clayton and Shuttleworth.

3071. Of course they would prefer you doing it through them as agents, to your sending over a special exhibit which would only have "Clayton and Shuttleworth" in big letters on it?—Yes, they would prefer that; but they do not forget to say "You will help us in this, won't you?"—in the expense I mean.

3072. Do they say that to you?—Yes, they do. They say, "We are going to spend a lot of money in sending this machinery of yours to this particular show at Düsseldorf: what do you say about the expense? You will help us a bit, won't you?" So we have to do it.

3073. In that case you do help and divide the expense?—Yes, we help them as far as we possibly can.

3074. Still, I suppose that comes very much cheaper than sending over your own staff and your own machinery?—It may do; but if you get four or five or six agents in the one show-yard, those four or five or six agents will probably have 12 or 14 or 16 sets of threshing machinery, whereas if we were there alone we should be satisfied with perhaps three or four. So it is about as broad as it is long, and the expense to us is as great when we are represented by our agents as it would be if we were there direct.

3075. You rather take the position that you are ready

to go on showing at all big exhibitions?—Yes, undoubtedly.

3076. Whatever the organisation is?—Yes. If we were to know that an international exhibition was to be held, in Rome we will say, or anywhere else—I do not care where it is—we should set to work at once and begin to inquire into it, and say, "We cannot afford to be out of it; we must be there."

3077. I suppose you allow in your costs a certain amount for exhibiting, as you do for other forms of advertising?—Undoubtedly. There is a distinct item for it in the annual balance sheet. Every farthing of expense that we incur in attending these exhibitions and shows is accounted for, and every item is specified in its own particular column, if I may use the expression, so that we know at the end of the year exactly what it has cost us.

3078. Did you exhibit at St. Louis?—No.

3079. Why did you not exhibit there?—Because it is utterly impossible to do trade with America. We cannot pay this duty of 40 per cent. which meets us right straight off the reel.

3080. Then there is such a strong competition there, is there not? You are, of course, aware that on lots of classes of goods our people can pay that 40 per cent., or rather they can let the American consumer pay that money, and still send their goods there?—But we cannot. Of course, it is a fact that the American competition is very strong, in our Colonies particularly so; and we find it also in other parts of the world. American competition in the Argentine is very severe, and is becoming more so every year. In other countries it is the same.

3081. In the way of freights you are better off in South America than the manufacturers in the States are, are you not?—Yes, we are, rather.

3082. Do you exhibit at the Colonial exhibitions, such as those in Australia and the recent one in New Zealand?—We were not directly represented at the New Zealand Exhibition at Christchurch.

3083. Why did you not exhibit there?—We preferred in this instance to do as we shall do at Düsseldorf, namely, exhibit through our agents.

3084. Have you an agent in New Zealand then?—We have agents all over the world, and at this exhibition at Christchurch we should be represented by our agents, Reid and Gray, of Dunedin, and a firm from Canterbury, and another from Wellington, and so on.

3085. Do you think that the awards at these exhibitions are fairly given?—That is a question.

3086. What is your opinion upon it?—We have no reason to complain—none whatever. There is, as you know, a *prestige* belonging to the name of Clayton and Shuttleworth It is a very old firm, and it is a firm that has a very high standing—I say it with all modesty and all reserve—for the excellent quality of its manufactures. Its engines and threshing machines, and so on, are known all over the world, and they have a name, and a fame, and a reputation. I think, perhaps, it is a little bit bombastic, but the jury, so-called, at these Continental exhibitions feel "Really and truly, we cannot pass them by; they are so well known that it would be a slight." But there is really in one sense not much merit due to the award—not as would be the case if an actual trial of the articles exhibited were to be made.

3087. You think they go by the *prestige* of the exhibitor to a certain extent?—Yes, they do—to a very large extent.

3088. And by the size of his works, and the long time that he has been there?—To a very large extent; and that is why I had a little hesitation in answering your question I am afraid that it is possible that the smaller fry may be frequently overlooked, and that the jury do not take the time and the trouble to inquire into, and to ascertain exactly from the representatives of the firm concerned what are the merits of the particular article exhibited.

3089. (*Mr. Wilson Fox.*) Do you want a practical test? Do you think that would be better?—A practical test is undoubtedly the only means of arriving at the qualifications.

3090. But it is not possible to have it, is it?—No, it is not possible. Therefore I say that the awards are more or less superficial and therefore valueless except from the advertising point of view. The fact that you have obtained the highest award that it is possible for the jury to give you carries this with it—the general public do not stop to inquire under what circumstances this award was given, but they say "They have got an award, and, of course, if that is so, they must be right at the top of the tree."

3091. (*Chairman.*) And you think that may come rather hard on some of the smaller manufacturers?—Yes, I do think so. As I said just now, the merits of the particular article may not be sufficiently investigated by the jury, and so the awards by the jury are more or less a farce.

3092. If I exhibit a cat or a dog at a show, the prizes are given according to the merits of that cat or that dog?—That is so.

3093. They are not given according to who I am, nor because I am always exhibiting dogs and cats?—No, I see what you mean exactly. You may go on and take a distiller or whatever it may be; in his case the jury may go to the different stalls and taste this, and taste that, and taste the other, and then there is a certain amount of practical test given to the article; but with machinery it is somewhat different.

3094. It would be very difficult, I suppose, to test machinery?—It would occupy a large amount of time and it would be a very expensive process. Perhaps you may remember that at the Great Exhibition of 1851 this was actually done. In our own trade engines and threshing machines were actually tested and tried, weeks of trial being given.

3095. In Hyde Park?—In Hyde Park. The portable steam engine and threshing machine in that year were novelties, they were only just coming into existence. The flail then was gradually being ousted in favour of mechanical action.

3096. For many years you have not had any testing of the machinery, have you?—No, not for many years. The practice of the Royal Agricultural Society of England was for many years to have most exhaustive tests.

3097. But that has been given up, has it?—Yes, it has been given up to a very large extent. Now and again they will have tests. They divide the different manufactures into sections, and this year they are going to deal specially with a certain class of machinery, I really forget what it is; I ought to know, but it has gone from my mind, and at all events it does not interest us, as it is not in our line. We have not had a trial of steam engines and threshing machines for many years.

3098. If there is no trial the result is left to reputation a great deal?—To a very large extent that is so. The Jury will be satisfied by the name, "This is Clayton and Shuttleworth," "This is Marshall's," "This is Ruston, Proctor and Co.," "This is Ransome's," or whoever it may be.

3099. I suppose you are not so much dependent upon the decoration of your court or upon the position you have assigned to you as other manufacturers are? You take up a large space in an exhibition, of course?—Yes, we generally make a good display.

3100. You attach importance to that, do you?—Undoubtedly.

3101. Have you been fairly treated in most of these exhibitions as regards space?—Yes, we have nothing to complain of in this sense, because the more space we apply for the more we pay. It is to the advantage of the founders of the exhibition to give us as much space as possible, because it means so much increase to their income.

3102. And are you content to pay for that space?—Yes, up to a certain limit. We do not do anything extravagant.

3103. About transport, you get reduced rates from the railway companies, do you not?—Yes, we do; and there comes in a point. That is where we have to thank the authorities in connection with the Milan Exhibition. Pressure was brought to bear upon the Italian Government to forego the duties in this particular instance, and to give us facilities in regard to transport over their railways, and so on. We had undoubted advantages there—not more than we think we deserved, you understand, but still it was very nice. It is appreciated certainly by us when we find that there is this consideration shown. Of course, it was made a condition that if the articles were sold in the country then the duty should be paid. We do not object to that at all.

3104. That is quite fair, is it not?—Yes, that is perfectly fair, and we do not object to that in any way.

3105. (*Mr. Malcolm Ramsay.*) You exhibit at

Mr. S. Sparkes.

21 Feb. 1907

foreign exhibitions partly because you hope to get fresh orders and partly because you want to retain your position; is that not so?—Yes.

3106. Which consideration has the greater weight?—I do not know; I think it would be about equal, but to maintain our position is, of course, a very important point. If you are no going forward you are going backward, and you must be always to the front. It would be very disappointing to one's *clientèle* if they went to an exhibition and found that their old friends Clayton and Shuttleworth were not present.

3107. Supposing you could eliminate that consideration, and that you were so absolutely established that nothing could take away trade from you, would you still think it worth your while to go to an exhibition for the sake of foreign orders?—No, certainly not; there would be no inducement.

3108. That is to say, the number of foreign orders would not be a sufficient inducement to take you to these exhibitions?—You are dividing the one from the other now; I thought you were still coupling the two.

3109. I say, excluding the question of maintaining your *prestige*, would the prospective trade abroad be a sufficient inducement for you to go and exhibit?—It might be so. Might I be allowed to say that possibly a great deal would depend upon the state of the order books at the time. If we were very full of work, we should say, "Really it is not a bit of use our going over there to show and cultivate more trade, because if we get it we could not deal with it." It very frequently is the case that we are so full up that we cannot take orders.

3110. I do not know whether you will be able to answer this question, but I should like to know whether in your opinion the trade that you get from foreign countries by exhibiting abroad is really trade which has not previously been had by any English firm; I mean, are you getting fresh orders from abroad, or are you diverting orders from one of your British competitors to yourselves?—I do not think we are diverting orders from our British competitors to ourselves.

3111. It is a general accession of business then?—Yes.

3112. And a genuine increase of our export trade?—Undoubtedly.

3113. It is not a diversion?—No, it is not. I fully believe that it is, as you say, a genuine increase.

3114. As regards the question of Government grants, in considering whether you will go to a foreign exhibition do you attach much importance to whether or not the British Government is participating officially in the exhibition?—Yes, we do attach considerable importance to the privilege of having the British Government at our backs, as it were.

3115. Do you value it because it gives you a greater lever if there is any dispute?—Exactly so.

3116. But you do not attach so much importance to the question whether you will get any direct pecuniary benefit out of any grant that may be given?—No; that is another question altogether with us. When we have the support of the British Government we have, as it were, the machinery of that Government in the particular spot at which the exhibition is being held more or less at our command, and we have a greater right, as it were, to appeal to the representatives of the British Government in that particular city or town or district. We feel that, and we have confidence in relying on their support, and so on.

3117. But you do not make any claim that the Government should pay any direct share of your expenses, do you?—No, we do not ask that at all. If they thought well to do it, of course, we should never refuse.

3118. Have you found as a matter of practical experience that you have done better at exhibitions where there has been a Royal Commission than at exhibitions where there has been some other form of organisation?—I cannot say that. I could not answer that question.

3119. You mentioned Milan just now. The work there was done by a committee of the London Chamber of Commerce, who were entrusted with the grant, was it not?—Yes, that was so.

3120. You have said that the organisation there was more satisfactory to you?—It was, for some reason, but I cannot tell you why.

3121. Have you ever taken part in a collective exhibit—I mean by that, a general exhibit of the agricultural machine industry as a whole, to which you might contribute one or two machines only, instead of having your own stand with a lot of your own machines?—Never; we have always had our own independent exhibit. I understand your question to be, have you, Clayton and Shuttleworth, ever joined Marshalls, Ransomes, Rustons, and others in a general collective exhibit?

3122. Yes?—Never. You mean by that, too, do you not, that the expenses of the exhibit individually would be lessened by there being one or two or three representatives for the collective exhibit instead of one for each particular firm?

3123. Yes?—That would not answer in our business.

3124. Lately at St. Louis, and I think at Paris too, there were a great many collective exhibits. For instance, there was one of sporting guns at St. Louis to which various gunmakers contributed exhibits?—There have been cases in which we have sent small exhibits to some comparatively small exhibition, where a man has been engaged to look after the exhibit, not so much as a representative and not so much as a salesman, but as a general supervisor and general overseer to look after the things and see that nothing is damaged. It has been felt in those cases that really and truly we had better make a show of a few of our articles, and that whatever there may be in the way of business will come to us afterwards through the post.

3125. Could you tell the Committee what it has cost you to exhibit at any big exhibition within the last 15 years; take, for instance, the two you have specially named—the Paris Exhibition of 1900, and the Milan Exhibition last year?—Certainly, I will with pleasure let you have the total cost, including attendants and everything else. I will either add it to this answer when I get the proof for correction, or I will send it up to Mr. Wintour, the Secretary.

3126. (*Mr. Harris.*) Do you think that if the Government were to withdraw from all participation in exhibitions, and were to let it be known that they withdrew from all participation in exhibitions, you would arrive at a stage where nobody would exhibit?—I do not think that it would be so. If the British Government were to withdraw as you say altogether, we should deplore the fact very much indeed, but I do not say that it would be the means entirely of stopping our exhibiting—if that is the question.

3127. Then it would not help you to what I rather gathered was an idea you had in your mind, namely, getting rid of the heavy expense which is forced upon you by trade rivalry?—I have never intended that the British Government should take upon themselves the entire expense of these exhibits; and I do not say that.

3128. I did not understand you to do so. If the British Government said: "We do not think that exhibitions are a very good thing for trade, and it is only drawing people on to get awards," do you think there would be a fair chance of people recognising that and dropping out? Would your own firm, for instance?—There are two points—the gaining of an award is one, and the orders booked is another. Supposing it were to be decided that for the future there was to be no awards, and we are going to convert these international exhibitions into a market, then it is clear that you would have a collection of machinery which had been got together for the purpose of sale. That is the case largely now. Take the Royal Agricultural Society of England. There are no awards given, except now and again a silver medal is given for some novelty, or something of the kind. The Royal Agricultural Society's shows to-day are nothing more nor less than a gathering together of marketable commodities. You bring the articles to the public and the public to the articles, you understand, and the Royal Agricultural Society is looked upon now as a means of securing orders and of introducing your goods to probable buyers or prospective purchasers. We do not go to the Royal Agricultural Society's shows any longer with a view of obtaining awards. We take our goods, exhibit them, and bring them before the thousands of people who attend the show in the hope that we are going, if not at the moment, then afterwards, to obtain orders as the result of the inspection which has taken place by the visitors to the show.

3129. I gather that you look a an exhibition of any

kind as a mere advertising medium?—To a very large extent that is so.

3130. And as an agency medium?—Yes, exactly, and we go, of course, with a view to obtaining orders. A man representing us will go, say, to the Dublin Show, which comes on next month or the month after, and if he comes home with his pocket-book full of orders he is patted on the back and he is a very good fellow, and we say we have done very well indeed at the Dublin Show, or we have done very well indeed at the Exeter Show, or whatever show it may be. Whether it is satisfactory depends on the amount of business done.

3131. How can you reconcile what you state about the agricultural machinery firms and their readiness to exhibit everywhere with the distinct reluctance which we have heard about on the part of most merchants to be present at any exhibition at all? What is there peculiar in your business which makes an exhibition so very valuable to you?—There is a distinction between agricultural machinery and, we will say, lathes and drilling machines and shop tools generally. Agricultural machinery is associated with out-door work—I am speaking now of the agricultural showyards of this country. The open showyard identifies itself with our business. Our goods are out in the open and they are goods that are used in the open, and the farmers and others who are buyers from us are very fond of attending these exhibitions, to which they go for a double purpose.

3132. You are thinking now of the agricultural exhibitions?—I am.

3133. But I am thinking more of the exhibitions abroad. Can you apply what you are saying to the exhibitions abroad?—I see what you mean; you are thinking of an international exhibition, a show like the Paris Exhibition, and so on.

3134. An international exhibition is what I have in my mind. I understood you to say that your own firm, and firms in the same line of business, were rather treading on one another's heels at such international exhibitions?—Quite true.

3135. As well as at home?—Quite true.

3136. Can you reconcile that anxiety to show on their part with the distinct reluctance on the part of other manufacturers and traders in this country to rush into exhibitions? What is the peculiarity in your business?—I think perhaps the peculiarity may be this: We agricultural machinery manufacturers in this country are so accustomed to these exhibitions—they go on all through the summer and we are constantly at it—that it has become part and parcel of our business and part and parcel of our nature. That practice is not associated with the other manufacturers that you speak of, and they are not in the habit of going almost week after week, as we do during the season, from one showyard to another. I am speaking generally, because we are rather conservative in that way, and we do not go to so many of the local shows as other makers do; but still it is part and parcel of our nature, and it is part and parcel of our business to be always to the front at these exhibitions, and, therefore, if there is an international exhibition, it is, as it were, second nature to us to go to it, as we are so accustomed to these things.

3137. When you go to an international exhibition, can you say whether you take more orders from the English and Colonial visitors at the exhibition or from the people in the country—I mean the nationals—where the exhibition is held?—That is a difficult question to answer. It would depend a great deal upon the class of exhibition and upon the character of the exhibition. If the exhibition is attracting to it a large number of colonists and a large number of English people, in all probability the orders from the colonists and our own countrymen would be as great as, if not greater than, the orders from the inhabitants of the district in which the exhibition is held. On the contrary, if it is only a small potato, if I may use that term, it would only be attended by the local population, and therefore the orders would come from local purchasers.

3138. I think you could not tell Mr. Ramsay why you found the Milan Exhibition so much better organised than the others?—No, I could not.

3139. May I ask you whether possibly there has been a progressive improvement from exhibition to exhibition in the organisation? You suggested that it was better in Paris in 1900, and better still in Milan; throwing back further, do you think, speaking broadly, that experience has produced better organisation on the whole?—I think it is undoubtedly the case that experience has resulted in better organisation. The evils of the previous exhibitions have been prominently brought forward, they have been seen and recognised, and therefore, they, have been avoided as time went on.

3140. Do you think that on the whole you gain as much from taking hints from foreign exhibitors in the same class, and exhibiting side by side with you, as you have lost through your goods being copied, as you explained, in Germany and elsewhere?—I should think as nearly as I can say, answering your question roughly, that it is about equal, and that the one has balanced the other.

3141. You have, in fact, taken hints?—We have taken hints undoubtedly.

3142. For instance, from the American goods?—Exactly so. We have taken many things.

3143. You would not buy the American saw you mentioned without having taken a hint or two out of it for your own manufactures?—That is quite true.

3144. (*Mr. Wilson Fox.*) With reference to the expenditure which you make from time to time in sending exhibits to foreign exhibitions, I assume, by your doing that, you think you are more likely to get foreign orders in that way than by spending a similar sum on travellers?—Undoubtedly.

3145. It is the exhibition of your machinery which attracts buyers?—Yes, that is it. I put it to you—a traveller calls upon you, and he is talking to you for some considerable time, extolling the virtue of some article that he has to sell, but if the man could show you the thing itself you would be far more satisfied.

3146. That is what I am working up to. That is a reason for agricultural machinery being shown more at foreign exhibitions than certain other commodities; because a traveller cannot take round your machines, and the only way you have of showing your machines on the Continent is by exhibiting at these big international exhibitions?—You have exactly expressed it. The traveller in our line cannot very well do as the Manchester travellers and other travellers do, that is, go round with 3 cwt. or 4 cwt. of samples. A man cannot very well take a portable engine or a threshing machine with him. An exhibition affords the only opportunity that we have of actually bringing our wares to the notice of would-be purchasers, or prospective purchasers.

3147. Is that not the main reason why manufacturers of agricultural machinery show?—That is a splendid explanation; it conveys more than I have been able to do in the answers that I have given to the questions.

3148. With reference to agricultural shows in England, of course there you have got your possible buyers coming to see your machines?—Quite so. We have the double advantage there that the farmers who are the buyers of our machinery are attracted to these exhibitions, not alone on account of the machinery, but to see the cattle, the sheep, the pigs the horses, and various other things which are always a source of great attraction to the farmers.

3149. But they are men who are interested in agricultural machinery?—Unquestionably.

3150. You say you do not show in America?—We never have done.

3151. Do you send travellers there?—No, never. We never make any effort whatever in that direction.

3152. Do you think that it is impossible to do business there?—Absolutely.

3153. With reference to the machinery exhibits—I am not asking about your personal exhibits, but I am taking generally the British exhibits of agricultural machinery at these large international exhibitions—do you think that they compare favourably with the exhibits of foreign nations in the same classes of goods?—In design and in quality of manufacture I presume you mean.

3154. I do?—Unquestionably. To-day Great Britain stands a long way ahead of all other countries for the excellent quality of her manufactures in this particular line of business.

3155. When people want to buy first-class machines abroad, machines that will last, do they buy English ones?—They do to a very large extent.

3156. By preference?—Yes, they do. If time allowed and it were of sufficient interest to you, I could give you

Mr. S. Sparkes.
21 Feb. 1907.

many instances of that kind, where, notwithstanding the strong patriotic feeling which exists amongst the German farmers and the great desire that they have to support their own industries, they admit that the English-made article is superior to-day to the German-made article. and will give, as they must do, more for the English-made article than for the German.

3157. Can you get those machines of yours into the European countries, notwithstanding the tariffs?—Yes, we do; but not to anything like the same extent that we did prior to the establishment of these manufactories. Our trade is falling off very materially. You know it is a comparatively small matter to rely upon this preference for the superior-made article. Many men, thoroughly understanding what they are doing, will properly be influenced by the quality of the article, but others, again, see nothing but the price—the £. s. d.—and whether they get the same quality never occurs to them at all. They say, "We can buy an engine and a threshing-machine for so many marks less from the German makers than we can from the English, and then we have a little bias, a little feeling, towards our own manufacturer," and so on. It is a fact that our German trade is falling off year by year to a very serious extent.

3158. Does it pay you better to show an article of the very best quality in order to attract the best buyers or to show a second-rate article in order to attract the second-class buyers?—We decided years ago never to attempt to cater for the cheap market, but to retain our reputation for high-class quality. Although I speak rather dolefully of our German trade, I am thankful to say that in other parts of the world we are always finding markets to replace what we lose in Germany.

3159. Is it not rather a characteristic of other British commercial men that they rather look to making the best things, leaving other countries to make what is called sometimes "cheap-jack" things?—Quite so—German made articles.

3160. (*Mr. Harris.*) You speak very strongly about the great superiority of British-made goods in your particular line; in saying that, have you the American goods in mind also?—Yes.

3161. Do you claim that the British-made goods beat the American goods in quality?—Unquestionably so. But bear in mind that the Americans make up for their want of quality by very much lower prices. The Americans will say "we know perfectly well that this particular set of threshing tackle that we are offering you will not last nearly as long as the English; that we admit; but is it not better that you should buy this set of tackle and that you should run it for three or four or five years and then, instead of spending money in repairing that tackle, you should throw it on the scrap heap and buy a new one, because in buying a new one you will get all the latest improvements embodied in the new purchase." That is the doctrine with them altogether. They do not make any scruple about it. They say "We know very well our boiler plates are an eighth of an inch less in thickness than the English, and this, that, and the other, and that the brasses we put in are not brasses at all, but simply white metal poured in; but it answers its purpose for the time."

3162. (*Mr. Wilson Fox.*) Do you make ploughs?—No.

3163. (*Chairman.*) Not steam-ploughs?—No, we do not make any ploughing tackle at all. We make the traction engines which are used for hauling ploughs, but we do not make Fowler's double-engine plant, for instance.

3164. (*Mr. Algernon Law.*) Do you make reapers and binders?—No.

3165. In the statement that you have sent in I do not see that you have put down any German exhibition at which you have exhibited, but there have been some local exhibitions in Germany; have you ever sent there?—The questions sent down to us referred, I think, to international exhibitions as we understood them.

3166. Have you not sent then to any German exhibitions?—Yes, we have. Are you referring specially to agricultural exhibitions?

3167. I am referring to any exhibition at which you have had an opportunity of showing your machines?—We have sent many times; but your formal question on this point I think refers to international exhibitions, something on the lines of our exhibitions of 1851, 1862 and so on.

3168. I do not know whether you have mentioned your trade in Russia. Have you heard it said that the Americans, and I think the Germans, too, but I am not certain of the Germans, send men out with machines to show the people how to work them, so that if any small breakage occurs they can repair them?—Yes.

3169. Then they also standardise all the parts; so there is an advantage there?—Yes, there is. That is done by us as well. We standardise every part. It is a most elaborate system that we have.

3170. Is it a new practice on your part, or an old one.—It is quite old.

3171. Do you send men out to show how the machines are worked?—Certainly. If we do not do it ourselves, it is done by our agents.

3172. In Russia they might be German agents, I suppose?—Most of the agents we have in Russia are of German nationality, with two or three exceptions. We have two or three English firms in Russia, but the German traders predominate; I think there is no doubt about that.

3173. If you send a machine to an exhibition a farmer cannot see it at work, can he?—No.

3174. So it would seem, would it not, that the more advantageous way of pushing your trade in a foreign country would be to send a machine round the agricultural districts with men who could speak the language and who could show how the machines could be worked, rather than to send the machines to an exhibition where they would be stationary?—That has been done in the past frequently; engines and threshing machines have been sent into a district and taken from place to place. But that was many years ago, and now we rely on that work being done for us by our district agents, who, in the majority of instances, are engineers with large establishments and a large body of workmen, all of whom, or nearly all of whom, are as capable of showing the working of an engine and threshing machine as one of our own men from our own place, through constant use and through constant experience. Going back to your question about standardising, the standardising of the parts of a threshing machine, or the parts of a portable engine, or any other engine, is as old as the hills with us—in fact it is carried to such an extent that I think I may safely say that a heap of the component parts of a threshing machine may be put upon the floor and from that heap the parts may be taken to construct the entire machine. That is what you mean, do you not.

3175. Yes. I do not know whether you have been asked whether you would like the Government to bear any part of the expense?—Yes, that question has been put to me. I do not look forward to that entirely, but I made the joke that we should certainly not decline any assistance that might be offered.

3176. But it is still worth your while to do it without such assistance?—Certainly.

3177. (*Chairman.*) Have you exhibited at any exhibition in Russia?—Yes, we exhibited at Moscow.

3178. I suppose that led to business?—Yes, unquestionably. There is not a shadow of doubt in my mind about the benefit of exhibiting at the various exhibitions which are named in my list.

3179. The Moscow Exhibition was held in 1872, which is a longish time ago?—Exactly; but then, you see, I do not think there has been another exhibition in Russia since 1872—at least I am not conscious of one.

3180. Anyhow you do a considerable business in Russia, I think?—We do a very large business indeed there.

3181. And in Siberia?—We are gradually getting into Siberia. Our portable engines are being sold largely just now from Vladivostock for that part of the country.

3182. Are they landed at Vladivostock?—Yes, they are shipped to that place, and our agents have a large depôt there in which these engines are kept in stock.

3182A. You are not manufacturing in Russia yet, are you?—No. The great portion of our manufacturing for Russia is done in Vienna, but even now we do supply a large number of engines and threshing machines direct from England to Russia.

3182B. Have you ever thought of manufacturing in Canada?—No. We are about the only firm in the trade with a second establishment such as ours in Vienna.

ELEVENTH DAY.

Thursday, 28th February 1907.

PRESENT:

Sir Alfred E. Bateman, K.C.M.G. (*Chairman*).
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G.
Mr. Algernon Law.
Mr. Malcolm Ramsay, C.B.
Mr. U. F. Wintour (*Secretary*).

Mr. Edmund Harry Lloyd, called, and examined.

Mr. E. H. Lloyd. 28 Feb. 1907.

3183. (*Chairman.*) What profession are you?—My profession, I suppose, is practically connected with the organisation of exhibitions.

3184. I see that you have been concerned with a great many exhibitions from 1878 to the present time?—Yes.

3185. You have held various appointments, and in the last two or three exhibitions you seem to have held some important posts?—Yes.

3186. You were general-superintendent for the Royal Commission at the exhibition at St. Louis?—Yes.

3187. And you are assistant manager of the present Dublin Exhibition?—Yes.

3188. Then you managed the Wolverhampton Exhibition in 1902?—Yes.

3189. And you were superintendent of the industrial section of the Paris Exhibition in 1900?—Yes.

3190. You have seen the formal questions that we have prepared, and I understand that on Questions 2, 3, and 4 you do not desire to make any observations?—Being in Dublin, I have, unfortunately, not been able to look up the statistics that are necessary for the purpose of answering those questions; and I think they all have really been covered by the evidence that has been given by my chiefs at most of the other exhibitions—for instance, Sir Henry Wood, Sir Herbert Jekyll, and Sir Charles Watson must have covered those questions.

3191. Then we come to Question 5. Do you consider that the direct commercial results obtained by the official participation of this country in international exhibitions have been such as to warrant His Majesty's Government in giving grants for the organisation of British exhibits in future?—My experience has taught me that to expect a direct result from an exhibition is almost impossible, and that the results to firms and manufacturers exhibiting will come on possibly three or four years' later. It is absolutely the same as an advertisement; you cannot advertise and then expect to get immediate results.

3192. But in this case sales might result at the time, might they not?—Not in a number of the cases—not in most cases, I should say. Sales result at the time in the case of a small manufacturer of jewellery or anything like that, but for machinery and other big manufactures, the exhibitor will have to wait possibly two or three years to get any direct result from it.

3193. Are there not orders for machinery which result from exhibiting?—Not on the spot.

3194. That is not the case according to your experience?—According to my experience there are not a large number. They would get a bigger result a year or two years after the exhibition than they would immediately.

3195. Do you know of results that have come a year or two after exhibitions?—Yes, I have known of several. I know that after the Chicago Exhibition there were one or two firms who did practically no business at the exhibition with the exception of seeing people and showing their manufactures to them, and yet for two or three years they were continually receiving orders resulting from their exhibiting at that exhibition.

3196. In what lines were they?—I can mention principally saddlery.

3197. Are you referring to sales in the United States?—Yes, but they did not sell anything at the time, practically.

3198. Did they get orders in the United States?—They got orders and are still getting orders from the United States through their exhibit in Chicago.

3199. I suppose that would be in very high-class goods?—Yes.

3200. You are aware, of course, that there is a very high duty on those things in the States?—Yes, and this is a high-class article.

3201. The duty is 40 or 50 per cent., I think?—Yes, it is.

3202. Can you say the same of any other lines that you remember?—No, there is no special line I can mention except that. I happened to know that, because I know the partners of the firms, and they have told me this. I have known of cases where even as far back as the Inventions Exhibitions in 1885 different people have written to me to say that they have seen something, and will I lend them my catalogue to look it out, so that they can order some similar goods.

3203. Then you have known several cases?—Yes, several.

3204. You have had a very large experience, and so you probably would know of a good many cases?—Yes. At one exhibition you see an exhibitor, and you may possibly see the same man three or four years after, and then you begin to learn of the results that he has obtained from the exhibition.

3205. In reference to our next question, whether you consider that equally satisfactory results could have been obtained by private enterprise, I understand that you do not think that as good results could have been obtained by private enterprise?—No, I do not.

3206. Do you mean that in those cases it is official organisation that has been wanted, or did they want money?—Both are wanted really. Exhibitions which are simply run by private enterprise, like those at the Agricultural Hall, always resolve themselves in the end into practically nothing more nor less than a bazaar. If you have not the money at your back to do it, you cannot keep up a proper exhibition, if I may say so.

3207. But surely a special exhibition, such as the Electrical Exhibition at Olympia, last year I think it was, which was run by private enterprise, you would not call a bazaar, would you, exactly?—I did not see it; but private exhibitions generally do become that. I am speaking, of course, of long-term exhibitions—that is, of exhibitions running for six months.

3208. You do not refer to the exhibition of specialities, such as motors, do you?—I do not refer to what I may call the trade exhibitions, because no doubt they do a lot of good for a week.

3209. They can be run by private enterprise, then?—They can; but not a long-period exhibition, I think.

3210. When you come to a general exhibition, then you think you want an official organisation?—In the case of a general exhibition or an international exhi-

Mr. E. H. Lloyd.

28 Feb. 1907.

bition you want the official organisation, and the backing and the backbone that is given by the Government in those cases. In the case of Glasgow, for instance, Glasgow was a very great success, and that had its backbone not from the Government, but from the town itself.

3211. I thought Glasgow was an excellently-arranged exhibition?—It was an exceedingly good exhibition, but it had the support of the town from the start to the finish. You could hardly call it a private enterprise.

3212. Would not most exhibitions have the support of the town in which they were held?—I should say so.

3213. So that some municipal organisation would suffice?—Some municipal organisation would do in the case of towns.

3214. That is in the case of the smaller exhibitions?—In the case of the smaller exhibitions I think it would.

3215. You were not at the Milan Exhibition, I think?—I was not at Milan.

3216. Nor at the Brussels Exhibition of 1897?—That is so. In 1897 I was at the Yachting and Fisheries Exhibition at the Imperial Institute.

3217. You have a high opinion, I suppose, of the capacity of business men to organise?—Certainly I have.

3218. But you think they want some help from some official authority?—They want some authority behind them, because, as a rule, exhibitors will not go into an exhibition if it is simply got up by a committee of gentlemen. If they can see that they have Government support and Government backing, then you will find that a number of them will go into it.

3219. That is as regards getting the people to exhibit?—Yes; and, of course, that is really the first step.

3220. Now as regards the accommodation and the facilities offered. Are you satisfied with what has been done by the organisations in the exhibitions you have been connected with?—The great trouble with nearly the whole of them has been that there has not been a sufficient grant to allow the Commission to assist exhibitors in the way that they might have done.

3221. Take the Paris Exhibition, which you were connected with: were there not complaints by people to the effect that their space was insufficient or that their space was not convenient?—Yes, there were. that will happen at all exhibitions. It is a difficulty that cannot be met really.

3222. We have had several criticisms on the management at Paris as regards the allotment of space and the difficulty of getting any remedy for grievances, and so on?—It really is a case that cannot be met. You only have a certain amount of space to fill, and a certain number of people to put into it. I should explain that every exhibitor expects the best position, and this is obviously impossible, and creates a grievance in the minds of some exhibitors, which it is impossible to remove.

3223. At Paris do you think we were fairly treated by the French authorities?—No, I do not.

3224. Was that for political reasons?—It was certainly for political reasons to a great extent. It was at the time of the Dreyfus business.

3225. Do you think that we were worse treated than, say, the United States?—I think so.

3226. Do you think that everything was done by the British Commission that could be done for the exhibitors?—Everything that was possible—everything.

3227. And that they were able to make their complaints heard?—Certainly.

3228. I think you do not suggest any improvements in the organisation of exhibitions, except that you would like to see a larger sum allotted by the Treasury?—I should like to see a larger sum given, in order to enable the Commission to assist exhibitors more. For instance, if the grant were sufficient to enable you to pay their carriage, or some proportion of it, to help them, I think it would be advisable.

3229. Would you make them pay for space?—No, I should not.

3230. Would you not charge them at all for it?—I would not charge them for space except in cases where the Commission itself had to pay for space. In all the foreign exhibitions space is generally given to the Government or the Royal Commission free, and I think if it is given to the Royal Commission free, the Commission, or whatever body it is, should allot it free to the exhibitors.

3231. And you would not charge them for carriage?—Not if the grant were sufficient.

3232. Then there is a large expense for decorating?—Yes, there is.

3233. Would you not charge for that?—No. I think that the general decoration of the section or sections should all be carried out by the Commission.

3234. Do you think that the British Government should pay for all that?—I do.

3235. So that the exhibitor would pay for very little more than for having some agent to represent him?—Certainly.

3236. And he for that would get a very good advertisement?—Yes. It really does cost exhibitors a large amount of money to show. They get the advantage, of course, but I am looking at it more from the point of view of trade generally, and from the point of view of what has been done by the majority of foreign countries. Germany, for instance, will do that.

3237. Is it not done under conditions by Germany?—I do not think they have any condition, except that exhibitors shall supply their manufactures. The exhibits are sent over free, and are arranged free, and the whole of the exhibition is practically run by the German Government. But they they have unlimited money at their back.

3238. Are you well acquainted with the German system?—Fairly well, I think, as it has appeared at different exhibitions.

3239. Are you also acquainted with the system of collective exhibits?—Yes. We had some collective exhibits at St. Louis. That was the first time that it had been done in connection with any British Commission to the extent that it was done there.

3240. Do you think that that gave satisfaction?—I think it did certainly, especially in the chemical section, which was the principal collection of collective exhibits there.

3241. That was one of the best trade sections, was it not?—Yes.

3242. Do you know the French system?—The French system is practically the same as we adopted for St. Louis—that is to say, the exhibitor lends his goods, only they make the exhibitor pay a sum towards the decorations, show cases, etc. The Government does not always support that permanent French Committee.

3243. By the French Committee, do you mean the society to which they pay a subscription?—No. There is a special Committee in Paris, which takes up exhibition work for the smaller exhibitions, such as the Glasgow Exhibition, for instance. Very often all the work is taken out of their hands by the Government itself; in fact, it is one of their articles of association that if the Government like to step in and to grant money it takes up the whole of the organisation of this Committee.

3244. That is only for the more important exhibitions, I take it?—It is only for the important international exhibitions. The small exhibitions are generally run by this Committee.

3245. Who pays the expenses of that?—The exhibitor himself. The Committee charge the exhibitors so much for their space, and so much for the decorations, and other expenses.

3246. Have you had anything to do with exhibitions managed by the London Chamber of Commerce?—No, never.

3247. I see that you had something to do with the Chicago Exhibition?—Yes; there was a Royal Commission for Chicago.

3248. That is true; there was a Royal Commission, but it was chiefly connected with the Society of Arts, I think?—The Council of the Society of Arts was constituted a Royal Commission for the purpose.

3249. What was your experience at Chicago? Was it

a good British exhibit?—It was not a really good representative exhibit. The same difficulty was experienced there that we had at St. Louis. It was a case, first of all, of the tariff. People would not show there because they thought they could not do any business. Then the political relations between England and the United States were not quite pleasant at the time.

3250. There are two other points I want your opinion on. Have you had anything to do with the awards at exhibitions?—Yes, a lot.

3251. Do you think that, as a rule, they have been satisfactorily given?—No, I do not, speaking for myself.

3252. Why?—I think in the giving of awards there are all sorts of influences that are at work, and that the tests are not absolutely fair and right.

3253. What tests?—The tests of quality, and that sort of thing. I think they are not absolutely fair.

3254. Is that because they go by the reputation of the exhibiting firm too much?—I do not think it is that altogether. I think it is more, if I may say so, that some member of the jury has a friend for whom he wants to get a special award, or that some agent has an interest in getting awards for a firm. In this connection I do not refer to Brtish jurors.

3255. You think it is not quite fairly done, in fact?—I think it is not quite fairly done; I am certain of that in Chicago. At St. Louis it certainly was better done.

3256. Do you think the British exhibitors have come off worse as compared with the foreign exhibitors?—I do not think that at all. I think they have been treated about the same all round.

3257. You think they have got their share?—Yes. But I would not like to say, even with the British exhibitors, that it had all been got in fair competition.

3258. In spite of that would you keep to the system of awards?—No, I should not.

3259. Would you give it up, then?—Yes, I would give it up.

3260. Would that not prevent people from exhibiting?—I do not think so now. I think that the idea of awards of medals at the different exhibitions has died out to a great extent.

3261. We have had it from several firms that they still attach great importance to the awards?—You will find that with a few firms, but not with a large number. The difficulty is that you cannot confine the awards absolutely to manufacturers; that is the trouble.

3262. To manufacturers as compared with what—agents?—As compared with agents or traders who go to these exhibitions. Then the tests of the goods are not considered up to date.

3263. Another question I should like your opinion upon is about the pavilions at Chicago, St. Louis, and Paris; do you think they were worth the very large expense incurred in putting them up?—Do you mean in putting up the special pavilion for the officers of the Commission?

3264. Yes, at an expenditure of £30,000, and that sort of thing?—The pavilion at Paris was really an exhibiting place, and not an office, because pictures were shown in that.

3265. Do you think it was worth the very large expenditure that was made on it?—I am afraid I do not; but it was a thing that it was necessary to do, or rather that it was politic to do, because every other country was doing the same.

3266. At Chicago, if I remember aright—and I was there—our pavilion was more expensively built than the others?—It was so at Chicago, but the pavilion at Paris was much more expensively built. Chicago was a brick and terra-cotta structure, and Paris was an iron structure.

3267. As compared with the other pavilions, was not ours the most expensive?—Ours was certainly the most expensive, with the exception of the German, and it was of a stronger construction altogether than the other pavilions. But then, of course, it was considered practically as an exhibit. I refer here to the Chicago pavilion.

3268. Have you any opinion as regards having a small permanent body in this country connecting one exhibition with another?—Yes, I have. I am of opinion that a lot of time is lost in commencing the work of every exhibition over and over again, because that is practically what the present practice means. For instance, with St. Louis the organisation was done there, and now it has all practically passed to the winds, and if another big exhibition of the same sort came on you would have to gather that material or other material to start work again.

Mr. E. H. Lloyd.

28 Feb. 1907.

3269. Did you get a large collection of books at St. Louis?—Yes, we had quite a large collection of books.

3270. And I suppose at Paris there was a collection?—Yes.

3271. Do you know what became of those?—They were all distributed again to the owners at the end. Do you mean the books of the exhibition?

3272. I am referring to the books of reference and catalogues, and so on, relating to the old exhibitions—what we might call exhibition literature?—Those books belonging to the Paris Exhibition went to the Record Office, and I believe the St. Louis books are going there; but, in fact, I do not know quite what has been done with them. (In answering this question I was under the impression that it referred to official records.)

3273. In Paris you had a sort of statistical bureau, if I remember aright?—Yes, but it was not much good, because there was no permanent record kept at all, to my knowledge.

3274. All the books that were sent over were not preserved, I suppose?—No.

3275. I suppose that any permanent body which might be appointed ought to have whatever books there are left?—They should have whatever is left for reference. If you want to make a reference now you will find very often that one of the members of the staff, or the secretary, or one of the chiefs, has the whole. For instance, he has copies of all the forms and everything of that sort. There is a copy to be found possibly in the Record Office among the papers, but then it is such a hard job to get at the papers at the Record Office, and you possibly have to wade through nine or ten cases of papers before you find what you want; whereas if there were a permanent office for exhibitions all those statistics could be kept there. I am speaking strongly on this point, because I know what a help it has been to me in the different exhibitions I have been connected with to have a guard book of all the forms and particulars of the circulars and other things which it is necessary to send out, and the dates of them.

3276. And the books which you have kept?—And the books which I have kept from the several exhibitions.

3277. The accounting books, and so on, you mean?—Yes. (In my answer I of course refer to copies or rulings of books which would be included in the guard book referred to in answer to Question 3275. The books themselves are always retained by the exhibitor.)

3278. (*Mr. Algernon Law.*) You have had a very large experience of exhibitions, but you seem only to be able to quote occasional instances of favourable commercial results. For instance, you quote saddlery as having obtained a good result from exhibiting, I think, at Chicago, was it?—Yes.

3279. Are those only isolated instances, or do you know of a great number of cases where there has been a commercial result?—I do know of a number of cases, but I cannot speak of instances in the same way that I can of the saddlery. That is a case which I am absolutely able to prove. In regard to the others I am only going on hearsay.

3280. Do you consider that British exhibitors require a money grant to assist them in regard to freight and so on?—I think that it would certainly be advisable as far as freight is concerned.

3281. But if they gained much by exhibiting, why should the State pay to assist them?—I think it should be looked at from rather a broader view—as assisting trade generally rather than assisting individual exhibitors. The same advantage should be held out to any exhibitor in the same line of manufacture, for instance.

3282. Then should there be no selection of exhibitors?—Certainly there should be a selection of exhibitors.

Mr. E. H. Lloyd.

28 Feb. 1907

3283. What body would you say should select?—That should be done by a committee.

3284. A committee formed by what method, or of whom?—A committee formed from whatever Commission you have.

3285. What do you consider that a Royal Commission should consist of; from what class should its members be chiefly drawn?—It should be varied. There should be on the Royal Commission gentlemen who have had experience of other exhibitions and of what has been done in that way, and there should be some business men, I think.

3286. How do you propose that the business men should be selected?—They should be selected by the Commission itself, I think.

3287. They would form part of the Commission?—Yes, as was done at Paris. There were a large number of gentlemen on the Commission who were selected from the heads of the Chambers of Commerce, for instance.

3288. Do you consider that British manufacturers were adequately represented on the Paris Commission?—I certainly think so.

3289. I think you said that the grant for Paris was inadequate?—There was some money returned at the end, I know; but then it was inadequate to assist exhibitors in the way of carriage and that sort of thing. It was a case really where the assistance given to exhibitors was dependent upon the amount of money at the disposal of the Commission. It was exactly the same at St. Louis.

3290. Do you consider the grant at St. Louis was inadequate?—It was inadequate for the purpose of assisting exhibitors in the way of carriage.

3291. Did they not pay freight to St. Louis?—No, not for a lot of them. They did for some of the loan exhibits, and they paid for the collective exhibits.

3292. I may be quite wrong, but I am under the impression that we were told by the secretary that they had paid freight to St. Louis?—Yes, for the collective exhibits.

3293. Not merely for the loan exhibits?—Of course, the loan exhibits were collective exhibits. But they did not pay freight in the case of a man who exhibited of his own accord. He had to pay the whole of his expenses, as there was nothing left to pay his freight.

3294. Can you give any special instances of the ill-treatment of British exhibitors or of the British section at Paris? Was there anything of that sort with respect to the awards or with respect to the management and the keeping of order, and so on, in the British section?—There was very little trouble with exhibitors, but there is always a certain amount of trouble when you have to deal with 500 or 600 people. They object to regulations which it is necessary to enforce. One man imagines that there is no earthly reason why he should not have something, and he does not see that the same principle has to be applied to the other 500 or 600. The trouble is in carrying out the regulations.

3295. Were there any instances in which the British officials considered that the exhibitor had not carried out the regulations, and that the exhibitor refused to attend to what the officials had said, and in the result it appeared that the French did not object to what he had done?—Only in the case of sales from the stalls.

3296. Were there not cases of that sort in reference to the arrangement of exhibits?—No, we had no trouble with the arrangements of the exhibits, at least nothing that came within my knowledge. There were cases where an exhibitor wanted to turn his stand into a sort of shop or bazaar, and there the Commission had to put its foot down and say it would not allow it.

3297. Was there not any trouble over the pottery exhibits in the Paris Exhibition?—No, there was no trouble over the pottery exhibits—at least, nothing that I ever heard of.

3298. I thought there had been some case in which an exhibitor had obtained, as he believed, permission from the British officials to arrange his pottery in a particular way, and then he was told that he must alter that arrangement because the case came too far out into the gangway or something of that sort; but he declined to move his goods, and said that if they pleased they might bring an action against him for not removing them, and then it appeared that the French had no objection at all?—I do not remember any instance of that sort. We had no trouble at all with the pottery exhibits in Paris, as far as I remember—and it was one of my sections.

3299. Then you would have heard of such a case?—I should have known of it, certainly.

3299*. Was there always a Commission official in attendance in the British section the whole day, so that in the case of any British exhibitor finding he was exposed to any annoyance he would have somebody that he could appeal to?—We had men on duty in the Exhibition the whole of the time it was open.

3300. Were there any of the superior officials there? I do not mean a man in the position of a warder or constable; but one of the superior officials themselves?—Not in each section of the Exhibition; but each section was visited.

3301. Was there always somebody accessible?—Yes.

3302. And was everybody informed where they might go to in case of need?—They knew the offices, the place where they had to change their passes, and that sort of thing. Beyond that, there was always some responsible official who visited the sections once if not twice a day to see if there were anything wrong.

3303. But he was not there the whole day?—No.

3304. And you were not there always; you were moving backwards and forwards?—That is so.

3305. We were informed that that was a difficulty which was encountered by British exhibitors?—Of course, where you have 14 or 15 different sections you would require a tremendous staff if you were to have somebody in each section the whole time.

3306. How many did the staff consist of?—We had a superintendent for every two or three buildings.

3307. What was the number of the superior officials on your staff—I mean the people of education?—We had about 13 or 14, I suppose, altogether.

3308. I gather that on the whole you approve of the system of appointing a Royal Commission?—On the whole I do certainly. I think that a Royal Commission gives a *cachet* to the thing which you cannot get from any special committee.

3309. Do you think a Royal Commission is a useful body?—I do, certainly.

3310. Have you heard of any difficulty in inducing British firms to exhibit; if so, to what do you attribute that?—It is attributable, I think, to various reasons. If it is the case of an exhibition abroad, it is attributable in many instances to the agent of the exhibition in the town or in the country where the exhibition is held, who may consider that it is a little bit too much trouble for him to look after the exhibit, and so he advises the firm not to exhibit. That was particularly so at St. Louis.

3311. Have you heard of instances where the agent sold the goods under his own name, with his own name affixed to the articles, and that he objected to the name of the real manufacturer being brought before the public?—That has happened at all exhibitions.

3312. So that is a difficulty which you cannot well overcome?—You cannot overcome it. The agents (I refer here to the permanent agent of the firm in the city or country in which the exhibition is held) gets an impression in his mind that the firm is going to deal direct with other houses instead of through him.

3313. So that in that respect a British section must always be inadequate?—Certainly it must be in that respect, until they get over that.

3314. That is because British manufacturers employ agents?—Yes.

3315. But if the British section will always be inadequate for that reason, do you think it is an advantage or a disadvantage that there should be Government support given to the section?—I think that without the Government support for an international exhibition there will be practically no British section worth speaking of at all.

3316. To pass to another matter, you said, I gathered, that the German pavilion at St. Louis cost more than the British pavilion?—I believe so.

3317. Do you know what the cost of the German pavilion was?—I do not know the cost of it.

3318. Do you know what became of the German

pavilion?—The German pavilion at Chicago is still standing, I believe.

3319. What about that one at St. Louis?—I believe that is down. It certainly cost more; it was a bigger place altogether. It cost, I should say, quite three times the amount that the British pavilion did.

3320. Could the same result as regards appearance and use have been obtained by a less costly structure in our case?—I think not.

3321. Nor at Paris?—I think not.

3322. Our building at Paris was the only building made of steel, I think?—No, it was not the only one.

3323. And but for that the same result could have been obtained by an expenditure of £5,000, whereas it cost something like £30,000?—There was a railway underneath, and we had for the safety of the pavilion to put the steel structure on the top of it.

3324. Did the railway run along by the river and then cross it?—The railway ran underneath.

3325. Was our building placed over the railway and no other building?—Other buildings were just the same. The Italian and most of the other foreign pavilions in the Street of Nations were all above the railway.

3326. Did the railway cross the river?—The railway did not cross the river, but it ran right along under the buildings.

3327. So that practically every building suffered in the same way?—Yes.

3328. Why was our building, as I understand, the only one that had a steel framework?—It was not the only one by any means.

3329. I understood it was so?—If I remember rightly, we had to put those iron girders over the railway on instructions from the French engineer.

3330. That was for the foundations?—Yes.

3331. But the whole of our buildings was made of steel?—Our building was of iron, but I forget the reason of that. The committee, I know went very carefully into it.

3332. The other buildings may have had a steel sub-structure, they had not a steel super-structure, had they?—No, certainly not.

3333. What was the difference in our building?—Certainly our building was more permanently erected.

3334. What was the reason why our building should have been built of steel?—One of the principal reasons of the committee for doing that was the number of art works that were to be stored in it, and their object was to make it as fire-proof as they possibly could.

3335. We have never heard that point raised before. Were there not art works in the other pavilions?—Yes, there were.

3336. Equally valuable?—Yes; but then there was a very choice collection of pictures in the British pavilion.

3337. I suppose there was an almost equally choice collection of pictures and other works of art in the other pavilions?—In the fine art galleries, certainly.

3338. I am dealing with the question of the expensiveness of the British pavilion, and you say it was necessary to have it made of steel throughout on account of the fire risk?—That was one of the reasons.

3339. You say that it was necessary because of the very choice works of art in the British pavilion, but then you also say that there were equally choice works of art in the other pavilions, the German, the French, and so on?—Yes, there were certainly.

3340. So that it would rather look as if the steel-work was a luxury, and not a necessity?—I do not think the steel-work was an absolute necessity. That is my own opinion of it. But, as I say, the reason why the Commission decided to put it up in steel was to have an absolutely fire-proof building.

3341. (*Mr. Malcolm Ramsay.*) Has the British exhibit at any exhibition at which you have been satisfied you in comparison with the show made by foreign nations?—No, it has not.

3342. Would you tell us why? Was it because the quality of the exhibits was inferior, or because the *ensemble* was not impressive?—For both reasons. It is a great trouble to get British exhibitors to go abroad, to start with. Then again the decoration of the building depends so much upon the grant the Commission has at its disposal. It has never been found possible to go in for decoration as a sort of setting up the exhibits on the same scale as the other countries have done.

3343. May I ask whether at Paris, for instance, the decoration of the individual exhibits was done by the Commission or by the individual exhibitors?—The decoration was done by the Commission, and it depended upon the amount of money that they had at their disposal. (I understood this question to refer to the decoration of the sections, and not of individual exhibits.)

3344. Would you say that there had ever been a complete representation of the leading industries of Great Britain at any foreign exhibition?—No, I am afraid I could not say so.

3345. Would you think that it has been rather a haphazard collection of a bit of this and a bit of the other?—It has been that certainly; it has been a haphazard collection.

3346. You would not say that at any leading exhibition there have not been one or two, perhaps three or four, leading firms left out?—No.

3347. At St. Louis one of the prominent features was the chemical section, I believe?—Yes, the chemical section and the fine arts section. There was absolutely no machinery there.

3348. The chemical trade after all is a very small one, is it not?—No. I think there is quite a large chemical trade with the States.

3349. But still there were big trades unrepresented, including the machinery trade?—We had, I think, two machinery exhibitors, but they were not under the control of the Commission.

3350. I think you said that your opinion is that individuals who exhibit at exhibitions do not get direct commercial results from it?—Yes.

3351. But they get indirect results?—Yes.

3352. Do you think they get more trade in this way than they do by using their own travellers and advertising for themselves?—I certainly think they would if they would only adopt the system of sending a really important representative of the firm, who was not looking simply throughout the six months to get as many orders as he could, but who was looking to build up a trade. I think that the system of employing agents at exhibitions who have no interest to serve whatever, except to sell the goods that they have, and who have not to build up a trade, is certainly a bad one for the exhibitor.

3353. I suppose the exhibitor employs an agent on the ground of cheapness; is that the reason of it?—Yes, and to get an award.

3354. You took a prominent part in the Glasgow Exhibition, did you not?—Yes.

3355. Could you tell us roughly how it was organised? Was it got up by a committee of the Glasgow municipality?—It was started by a committee, the majority of which were members of the municipality, and then the guarantee fund was arranged. I think they had a guarantee there of something like three-quarters of a million. As soon as the guarantee was assured, then the exhibitors simply poured in.

3356. Did they get their exhibitors by circularising?—Yes.

3357. And by personal influence?—Never by personal influence. They got them by circularising more than by anything else. They never got them by canvassing.

3358. In the case of the international exhibitions with which you have been associated, have not circulars completely failed to get any response?—No.

3359. We have had it in evidence that many firms just throw them into their wastepaper baskets?—I think that is not the case with the majority. That was not the case with Paris, and it was not the case with St. Louis. To go to a smaller exhibition, the present one at Dublin, we have found that sending canvassers round to firms has been an absolute failure. Firms prefer to deal direct with the head office. Another thing, if I may say it while I am on this subject, is that your canvasser possibly does not see the manager of the firm, but he comes back with a promise, that the firm will exhibit. You rely on that promise, and at the end he does not materialise at all.

3360. That is your experience?—Yes.

3361. That is not what I have gathered from other witnesses?—The personal canvass of exhibitors is a mis-

Mr. E. H. Lloyd.

28 Feb. 1907.

take unless you can see the chief—a man who can made an absolute promise to you.

3362. You said I think in your main evidence that you considered the Government grant has not been sufficiently large?—Yes.

3363. And you think that if more were granted in the direction of relieving exhibitors of their expenses they would be more anxious to come in?—I certainly think so.

3364. Are you clear on that?—I am quite clear about that.

3365. We have heard a good deal about the difficulty of getting exhibitors, and the main reason very often which they have given for their refusal to participate has been that they do not think it does them any good. I put it to you that if this is the general opinion amongst exhibitors, is it likely that they will ever be induced, even by direct contributions towards their expenses, to go to these exhibitions?—I certainly think that they would be induced to do so if we paid, say, the carriage of their goods, or provided them with a showcase or something of that sort, and assisted them in some way.

3366. Even with the manufacturers who think it is of no direct use to them?—Yes, I think so. I am strongly of opinion that they look at the outlay that they are going to have in the present year, and that they do not look in many instances to the benefit that will accrue to them, say a year or two afterwards. I have found in talking to exhibitors that they first of all will say they will not have anything at all to do with an exhibition. It was so especially with the chemical trade. Still, if you can say, "If you will only provide the exhibit we will pay your carriage," the reply invariably has been, "That is a different matter altogether; under those circumstances we will come in."

3367. Taking the case of that chemical exhibit, was that not largely got up and organised by the personal exertions of two or three members of the St. Louis staff? That was not got together by circulars, was it?—No. The majority of it was done by circularising. Then Sir Boverton Redwood and Mr. Tyrer used their personal influence where people would not come in. The influence that was the greatest in the whole thing was telling the exhibitors that the Commission would not put them to any expense—the Commission would pay for the carriage, they would arrange their showcases, exhibit their goods, and return them.

3368. Has your experience led you to form any opinion as to the possibility of getting British manufacturers to combine for the purpose of collective exhibits?—It is one of the greatest troubles in exhibitions.

3369. Have you found them very reluctant to combine?—They have been very reluctant to combine. The British exhibitor will not sink his individuality for a moment.

3370. And yet I gather that you think the collective exhibit is the best form of representing certain industries?—Certainly.

3371. If that is so, and the manufacturers are very reluctant to combine, are you sanguine that improved organisation would really produce much better results than we have got in the past?—I certainly think that it would. There was a departure from that at St. Louis, and it did go certainly a long way towards arranging for collective exhibits. The difficulty in that case is that where we provided a show-case for a man, he wants his own special sign put up, and one man would like a blue plush back to his exhibits to show them off, and another one wants a green. That has been the great trouble in getting organised exhibits to compare with Germany or France, where they simply have a show-case all the same and cut off a little piece for each man.

3372. Do I rightly infer from a previous answer you gave, that it is your opinion that the Government money has not been spent quite to the greatest advantage in the past?—No, I do not think that.

3373. Do you think the greatest good has been obtained from it?—I think the greatest good has certainly been obtained from the money that they have had at their disposal.

3374. (*Mr. Wilson Fox.*) You have been to a large number of exhibitions, I understand, in the capacity of manager, general superintendent, assistant-manager, and so on?—Yes.

3375. I suppose in that capacity you received any complaints that there were to be made?—In most instances, yes, in the sections which I controlled.

3376. Do you find among the British exhibitors that a large number of complaints are made?—Not a very large number. I am speaking of those that reach the ear of the executive.

3377. I am only trying to find out whether the reluctance to exhibit is due to any feeling upon the exhibitors' part that they are dissatisfied with space, and so on?—I do not think so at all. The only trouble, if I might say so, that we have experienced with exhibitors is rather that they will not conform to the regulations, not only those that are issued by the British Commissions, but those that were issued by the foreign authorities.

3378. Have you found that that is a difficult matter to deal with?—It is a very difficult matter.

3379. You have to exercise a great deal of patience, I expect?—It has to be exercised.

3380. And your object is to send these people away happy?—I send them away as happy as I possibly can. The exhibitor looks at the thing from quite a different point of view to that from which the executive have to look at it. You have 500 men to deal with, or 600 men, as the case may be, and the same principle has to be applied to all, each one thinks there is no reason why you should not treat him with more favour than the rest. He imagines that his little crow is a pigeon, as it were.

3381. And I expect you let him think that is so?—Certainly.

3382. And you send him away quite pleased and contented in the end?—We send him away contented in the end.

3383. That would be so in most cases?—That would be so except where they will go dead against the regulations, and then, of course, strong measures have to be taken in those cases.

3384. Then you do take strong measures sometimes?—Never myself. I do that in consultation with the secretary or the commissioner.

3385. Where you find it necessary to do it?—Where I find it necessary, I certainly advise the commissioner to take strong measures.

3386. But those would be exceptional cases?—Absolutely exceptional.

3387. (*Mr. Harris.*) There are one or two points in which your evidence is so different from some things we have heard that I should like to ask you for one or two explanations. Why do you say that in some points the interests of the executive must be opposed to those of the exhibitor? Is it not the business of the executive simply to look after the interests of the exhibitors?—Certainly; but then in foreign exhibitions one of the duties of the executive is to see that the regulations are upheld, which they have given their word to the authorities where they are exhibiting, shall be upheld.

3388. Is the executive usually absolutely bound by those regulations? Cannot they with a little diplomacy get them stretched or tightened, and so forth?—They can, and it has been done in every instance possible. We have done that. Sir Herbert Jekyll did it in Paris, and Sir Charles Watson did it at St. Louis. The regulations there were stretched as far as possible. But a permission would not be given to the exhibitor to go beyond the regulations until it was settled by the chief authority at the exhibition.

3389. I suppose you recognise the exhibition agent as a necessity?—Yes.

3390. I should think you would call him a necessary evil under the present arrangement?—Certainly he is a necessary evil.

3391. But do you not think he is a man who with a little handling can be got into line?—Some you can, but some you cannot.

3392. It is a matter of personality, you mean to say?—It is absolutely a matter of personality. It means this: When you are dealing straightly and thoroughly and honestly with the exhibitor and the

executive of the exhibition itself—I am not speaking of the Commission for the moment—that the agent goes behind your back, say at Paris, and gives a bribe to some of the officials, and then he comes back to you with their permission saying the French people do not object, or the American people do not object, but you object. That is due to the palm-oil which has been used by the agent. It has therefore to be verified with the head authorities before the Commission can give permission for that extra thing to be done.

3393. Do you think that is a danger which can be looked upon as a general danger?—It is certainly a general danger. I have no hesitation in saying so.

3394. Do you think that could be to any degree got over by having a larger sprinkling of commercial men upon the Committee or upon the Royal Commission?—I do not think so. I think you will always have the same difficulty. It is a difficulty that we have met with at every exhibition.

3395. (*Mr. Wilson Fox.*) There have been complaints by witnesses who have come before this Committee of our organisation as compared with foreign organisations. Do you think that we are under-staffed, and that our British Exhibition Commissions require more hands?—Yes; I think we have been a little bit understaffed almost through the whole of the exhibitions.

3396. That is your general experience?—Yes.

3397. Do you think our organisation could be bettered if we had more men on the staff?—The trouble is this: That when a Commission starts you have to pick up new hands and teach them, and you have nobody who has had a lot of experience before. Then subsequently the time arrives when decentralisation comes, and then they have to act on their own, and they do not always act discreetly.

3398. By "they" you mean the members of the staff?—I mean the subordinate members of the staff. Some of the men whom I should call assistant-superintendents of buildings, for instance.

3399. In what way would they not act discreetly? Do you mean that they are rather rough with people?—Very likely. Another thing is this—that they do not see the general principle that has to be adopted in dealing with all exhibitors alike. They say there is no reason why one man should not have a certain thing, but then that involves the principle that you have to permit the whole of the exhibitors to have the same thing.

3400. Do you think we are greatly under-staffed as compared with some of the foreign countries?—I think we are, certainly.

3401. And one of the reasons for criticism in some quarters is that our organisation is not quite so effective as they think it might be?—Certainly that might be so.

3402. (*Mr. Malcolm Ramsay.*) Did you, when the stands were being arranged and the exhibits were being put into place, provide any police or staff of guardians to keep the ground clear?—Yes.

3403. Do you know whether you had as many as other nations, say the Americans?—We did not have so many as some of the other nations had, but I venture to think that the few that we had were more effective than the Americans or the French. They were men who were working hard all the time, and they were not standing about doing nothing.

Mr. E. H. Lloyd.

28 Feb. 1907.

3404. (*Chairman.*) I suppose it has always been necessary to engage new men for most of these exhibitions, as you never could retain people from exhibition to exhibition?—That is so. But there is no difficulty in getting men. I am speaking now more particularly of, say, the assistant-superintendents.

3405. Where would you get them?—Really, it is very hard to say. I have always found at exhibitions that the assistant-superintendents have been only too glad, as soon as they know that an exhibition is coming on, to apply for an appointment.

3406. There are a certain number of men, I suppose, who live by it?—I have a man now as assistant at Dublin who was at Paris in 1900, and at Glasgow and Wolverhampton. He has also been with Mr. Cundall in Milan.

3407. Is that all he does?—I do not know. The services of a man like that are invaluable, because you do not have to keep teaching the work to a fresh man.

3408. Still, you must have the exhibitions coming very thick for him to make a living out of them alone?—I do not know about that. I have not found that there has been much trouble with my record here in that way, but I have always been able to find men for the work.

3409. Have you never thought of any plan for a sort of reserve to be employed in other ways in the meanwhile, but you having the first call on them?—You cannot do that unless you let them have something to retain them. At several of these exhibitions the men, at the end, obtain permanent employment.

3410. Some of them do that, do they?—The majority of them obtain permanent employment.

3411. Owing to being exhibited themselves?—Yes.

3412. That is owing to their getting known?—Owing to their getting known amongst the exhibitors. I always think it inadvisable to persuade a man to leave a permanent situation that he has for an exhibition which will only last a year.

3413. (*Mr. Harris.*) You mean that he is drawn into a firm?—Yes.

3414. (*Chairman.*) He has been drawn into a firm, and so you lose him?—You lose him altogether for exhibition work.

3415. (*Mr. Algernon Law.*) You mentioned "palm oil" in connection with an agent getting behind the backs of the authorities and bribing some subordinate official?—Yes, I did.

3416. Have you, of your own knowledge, known of any instance of a man bribing an official?—I have been told of a good many cases.

3417. (*Mr. Wilson Fox.*) Have you ever known of a case of a juror being bribed, either of an attempted bribe, or of a successful bribe in the case of a juror?—I think that the same answer would apply to that as well, but the men referred to were not English jurors.

3418. There were a good many such cases?—Yes, a good many, so I was told.

Mr. August Bornemann, called and examined.

3419-20. (*Chairman.*) You come here, I believe, as representing Messrs. Ruston, Proctor and Company, Limited?—Yes.

Mr. A. Bornemann

3421. What position do you occupy in that company?—I am managing director.

3422. In what town are your works?—Lincoln.

3423. Have you been there long?—I have been there for 30 years, and this is my eleventh year as managing director.

3424. Have you exhibited at exhibitions abroad, and if so, what are the principal ones?—Vienna, Paris (twice or three times), Brussels, Antwerp, Amsterdam, Barcelona—those are Continental, of course. Then we exhibited at the Calcutta Exhibition. It is a long time to go back, but you may take it that we have exhibited at the principal international exhibitions, except those that were held in the United States.

3425. Do you exhibit portable horizontal steam engines, boilers, and threshing machines?—Not boilers, but portable engines, fixed engines, and threshing machines; and, as we went on, oil engines and other things that were brought out. At the Paris Exhibition we exhibited our steam digger as well. We were in three sections at the last Paris Exhibition. We were in the agricultural and industrial sections, and in the section of public works.

3426. Have you had any increase of business which you can directly attribute to exhibiting?—My experience has taught me that you cannot directly attribute business to an exhibition, if you refer to the sales effected at such an exhibition as I am thinking of—

Mr. A. Bornemann.

28 Feb. 1907.

that is, an exhibition which runs for six months as a rule. You exhibit a certain article, but the exhibit itself cannot be taken out of the exhibition until the expiration of the exhibition; therefore, the article that you show you do not really sell. But there is no doubt in my mind that if you give the public and all your agents who are attracted to that exhibition a chance, and show what progress you have made in your products, that can only be for your benefit. They see that you are going along, and that you are progressive, and they say to their customers they have seen so-and-so, and they know that you have been bringing out something with improvements or something novel.

3427. Do you not get orders at exhibitions?—You see, our article is one that you do not sell over the counter. You might get orders, and you cannot say you do not get any orders, but in proportion they are very small. In a business like ours, unless we have four or five months' work ahead, we are no good. Orders are placed with us in large quantities beforehand. The goods that we ship in February and March we get the orders for in October or November, so that we can work a long time ahead.

3428. If I understand you, you think you have had considerable indirect advantages from exhibiting?—Yes, I certainly do think so, because it keeps your name before the public. It would not do to stop at home, and your agents would not like it. Your agents would feel greatly handicapped. "Where are Ruston, Proctor?" "They stop at home." "What is the the matter? Have you gone through the hoop, or what is it?" You must be there, and it does you good to be there, and it does your agents good. You cannot sit still, you know, nowadays; it is impossible—perhaps it never was possible.

3429. But you have got several big firms in a similar line of business, and two at least at Lincoln; I suppose you meet Clayton and Shuttleworth at exhibitions?—Yes. I might say that we are very much bigger than Clayton and Shuttleworth, but that is a detail. Then we have Robey and Co., and W. Foster and Co.

3430. All at Lincoln?—Yes, and they all make threshing machines and portable engines.

3431. Have you experienced any disadvantage from exhibiting, by having your goods copied?—No, I cannot say that we have. What I am going to say may perhaps not be very flattering, but it is no use mincing matters. Take, for instance, the last Paris Exhibition. If I am a little long you will excuse me. The last Paris Exhibition, I thought, was a mart where a lot was to be seen, and where all the nations came and exhibited. I wanted our people to learn as much as they possibly could, and I arranged that all our foremen should go there; and they did go. I hired three rooms in one particular hotel, and three foremen arrived and stayed a whole week, and when they left on the Friday, there was another batch came on; and so that went on, and I gave these men a chance of seeing the exhibition. As regards copying us—well, I am afraid it is rather a mistaken idea. We are not too proud of ourselves. We must admit that the most novelties and the most recent inventions have not come exactly from English brains, but from American or foreign brains. When we have wanted to know something I have sent our engineers and our foremen over to see, and then to come home and report where they saw that other people were ahead of us.

3432. Has it been to exhibitions or to yards that you have sent them?—To exhibitions. Therefore, I do not think we have much danger of being copied; I believe the boot is on the other leg.

3433. Though you are a very big firm, yet you take rather a humble line?—It is no use being too cocksure that you have won the victory; that is no good at all. You must always be on the *qui vive*, you know; you must be on the look out.

3434. At the same time, you do a great business abroad?—Yes.

3435. In competition?—Yes. I may tell you that we are beating the Americans in South America. That shows that if you only keep your eyes open, and give everybody a chance to think, there is no reason why we should not build equally as good machinery as the Americans can. The same with Germany; we still do a large business in Germany.

3436. You have not shown in South America, have you; there are no exhibitions there, are there?—There has not been one recently. Indeed, I do not think there has been an international exhibition in the Argentine, we will say, because that is really the country in South America which I am connected with more than any other. At any rate, there has not been an international exhibition there for a long time; of course, there are local shows and local exhibitions, but I do not call those international.

3437. I suppose that at the Milan Exhibition of last year the Argentine would be represented very largely?—I do not think she was.

3438. Do you attach very much importance to the awards at exhibitions?—To obtain the first prize, or the highest award, is always a good advertisement. I will give you an instance. Take the Argentine. The majority of the colonists there are Italians, as you know perhaps, and we are able to advertise and fill the country with bills with a gold medal on them and *Gran Premio Milano*. Of course, these fellows think the world of that, because it is their mother country, and your having been successful in their own country there may be a tendency for them to say, Well, that machinery is all right for us.

3439. You have had a great many awards, I suppose?—Yes.

3440. Do you think you have deserved them?—If I say, No, then I run the show down and cry stinking fish; and if I say Yes, you might call me a very proud man.

3441. No, not at all; but do you think the system is a fair one under which you have got these awards?—I have never been behind the scenes. I do not know whether some people get an award when they do not deserve it. In France, some people have received the Cross of the Legion of Honour, and all that sort of thing, but that was perhaps at a time when they were rather cheap. I daresay that there is a Grand Prize given in this way; I daresay sometimes the members of the jury have to raise their hats for a certain firm, because the name is So-and-so, although they only exhibit perhaps £500 worth of machinery, and another firm, perhaps not of the same standing, who have gone to the expense of showing a very large collection of stuff, also get the *Grand Prix*, and of course, there is no appeal. You always have to be satisfied with what you do not get—I mean with what you get.

3442. These awards are given on the reputation of the firm, are they not?—Mostly, I should say; at least, I think it has been so a great deal with the Milan Exhibition.

3443. Your machines are not tested at these exhibitions, are they?—No, they are not in motion at all.

3444. Even as they are granted, you prefer the system of awards to none at all?—Certainly. Perhaps it may seem a little foolish, but in several countries—we will say India or China or Japan, all such countries where people still think a great deal of a little gold medal or a little ribbon—if your agent there has got in his office a tremendous thing with a lot of medals on it, that impresses the native buyers. I believe that if there were no awards at all, the number of exhibitors would drop off immensely, and quickly too.

3445. The next question I have to put to you is whether you have been induced by what you have seen at exhibitions to buy to any considerable extent from British and foreign manufacturers; I think you have answered already on that point that you have got hold of new ideas from them?—Yes. For instance, if we want new tools or anything that we think is labour-saving we go to an exhibition. We send a man first and let him look round, and then I go myself, and take a foreman or a works manager, and we look into it. You have the whole thing there before you, and if you do not like a German machine you can pick an English one or an American one.

3446. So that really you have got an advantage in both ways—first in sending your own machinery, and, secondly, in obtaining points from others?—Decidedly.

3447. You told us just now that you sent over foremen to those exhibitions if they were at all near?—Yes, we do. You cannot expect people to develop their minds, and you cannot expect to get new ideas from them, if you keep them caged up.

3448. Have you ever refrained from exhibiting, and if so, why? I think you have said you have not exhibited in the United States?—Yes, and the reason is on account of the high tariff.

3449. There was another reason, I think?—The other reason is that it would be useless to exhibit there,

because they do not want to buy our machines; they do not require them. Perhaps with the exception of a few textile machines (with which I am not conversant) they do not want our machines. Certainly, taking my line, steam engines, or threshing machines or excavators, or pumps, they do not want them. They are quite as far ahead as we are; they have all the raw material, and they have clever workmen.

3450. You told us, I think, that you still send an immense lot of machinery to South America in competition with North American manufacturers?—Yes, we do.

3451. I suppose the South Americans, the Argentine people, for instance, would come to the United States to see what they could see there, would they not?—They might do.

3452. Therefore I should have thought you would have exhibited there on account of that?—No. Of course, you must study the home market first, and the country in which you do exhibit. Then it is a frightful expense, as you will see, if I tell you in regard to the cost of the Paris Exhibition to us, £3,000 is not in it.

3453. Did you spend more than £3,000?—Certainly. It is a frightful expense, if you take it all into account. The United States of America do not buy anything from us, and so what is the good of showing there? Next year you will have an exhibition in Paris or somewhere else, and let the Americans and Argentinos come and see for themselves. All our agents have the very best in our stores, the very latest.

3454. They could come to Paris quite as easily, if not more easily, than they could go to the United States?—I should say they would come to Paris in preference.

3455. There would be more attractions there, perhaps?—Yes.

3456. Do you attach any importance to having some permanent organisation helping to minimise the trouble and the cost of exhibiting? Would that be of any use to you?—Yes.

3457. I do not gather that you do omit exhibiting, except, for a particular reason, in the United States?—Even if there were a permanent organisation, I do not think that we should go to the United States at all.

3458. That would not make a difference in the United States?—No, we should not go there.

3459. In other places, however, you are ready to exhibit without Government organisation or help in transport?—It would greatly assist us, decidedly.

3460. You would like it, and, of course, we all should?—Rather! I believe it would be a wise step for the British Empire to do so; it would encourage the industrials to come out and show what they have got, and to learn lessons. If they are behind, they learn that at an exhibition.

3461. You mean that the Government should pay a greater proportion of the cost of exhibiting to an exhibitor?—Or meet him in the rate for the floor-space, giving a rebate on the floor-space of so much. The cost of sending your exhibits is not so very important, of course. It always costs something, but you generally get your return freight on that at half the rate. Then, if you exhibit in Italy, for instance, most of the stuff is built for the Italian requirements, so that practically such goods remain in the country, and you do not take them home.

3462. You have not to bring them back again?—Mostly not, except we will say at a big exhibition like the Paris Exhibition, where you really show for the whole world.

3463. Speaking generally, and not only as regards your own classes of goods, do you think this country should take part in exhibitions, and not hold aloof from them?—I decidedly think so—most emphatically.

3464. You do not think that we have been represented adequately lately, do you?—No, I do not think so. It grieves me when you always see Germany being the cock of the walk. It is not very nice. I have seen the same thing in Milan. There were even German soldiers there—German soldiers with side arms.

3465. Exhibiting?—No; they were there to guard the exhibits of the German exhibitors.

3466. Sent there by their Government?—Yes. They had a big pavilion, and they did the swagger there. Take America at the Paris Exposition of 1900; it was a caution. It was enormous. I know we were pushed underneath the gallery. All the agricultural section was most miserably placed under the gallery.

3467. Under the gallery?—Yes, it was most disgusting.

3468. You were not satisfied, then, with the arrangements?—Not at all. I think it was disgraceful.

3469. Did you complain of it?—What is the good of complaining—not a bit.

3470. Did you complain?—Complain! Our representatives tried to complain, and letters were written from Lincoln, but what was the good of it? No support from home. I do not want to be personal at all, and I should not like my evidence to be taken in any way as personal. But you ask me to give my free opinion about the point you ask me upon. England is a tremendous Empire, and yet our English exhibit, we will say at Paris, or at recent exhibitions, I think has been poor. If we see a novelty, where does it come from? Tell me that? It is either "Made in Germany," or it has "U.S.A." on it.

3471. Is that the fault of the organisation of the exhibition?—No. You must elevate your people, and you must help them to show and learn, and they must be better supported. This is an immense country, and there is an immense industry here, and the Government should uphold the dignity of such makers, and bring them forward in a proper and dignified manner, on the same footing as Germany and the United States do.

3472. Can we take it then that you think the best things do not come forward at these exhibitions on account of the want of official organisation?—It may be the outcome of the poor interest which has been shown in previous years. I know a great many industrials who say, "What is the good of that? We shall only get a dirty little corner." It is a big question. Then we complain that the Germans squeeze us out here, and the Americans do that; and then it makes you sick of showing yourself.

3473. You make criticisms, but all the same you have been showing steadily, or rather you have not refrained from showing?—No, we have not refrained from showing.

3474. Though you criticise, and very justly, your treatment?—Yes; but we have not stopped at home.

3475. Do you think there are others who have stopped at home?—Yes, and I believe that is due to the treatment they have had in the past, and the lukewarm way in which their interests have been defended.

3476. We should like from you any suggestions or criticisms you have by which the organisation could be improved. Do you think the Royal Commission is at fault?—I should say so. First of all, to my mind, Great Britain, if there is an exhibition on, should take a far more noble stand, and on a larger scale, and set to work straight away—for instance, get your committee together, and canvass your people; show them that your country itself is going to be well represented in a right royal manner, you may say. Then you will get people together, and you will secure for your producers a larger and better share in the exhibition.

3477. But how would you start it? Would you have some person who should summon a committee or commission—an official person?—Certainly.

3478. Or would you leave it only to the business classes?—I would invite some of the chief industrials in this country to be on that committee.

3479. Would you have a permanent office to start the thing when there was going to be an exhibition which bids fair to be an important one?—A permanent office is a question that is rather one that I have not given any thought to, but I almost think there would be plenty of scope for it. The world is very big, you know.

3480. By a permanent office I only mean some small office, which would go on from exhibition to exhibition, and would have records of the traditions and the experience?—I believe there would be plenty of scope for it, certainly.

3481. What I wanted to get from you was whether you want to have the thing managed entirely by the London Chamber of Commerce or by the Association of Chambers of Commerce, or whether you think the Government are capable of managing the Commission and getting committees to take part in this work?—

Mr A. Bornemann. 28 Feb. 1907.

I should say it should be managed by the Government, because I am afraid that Chambers of Commerce are not sufficiently backed up, though there is a centre in the London Chamber of Commerce. I am afraid that it is a more lukewarm sort of business with the Chambers than anything else.

3482. Do you think the money that was granted by the Government for the Paris Exhibition, say, has been sufficient?—I do not know what money was granted by the Government.

3483. There was a large sum spent on the pavilion at Paris; did you get any good out of it?—No, we did not.

3484. You did not?—The exhibitors did not get anything; but we got a small return on our space at Milan, or a small bonus you might call it.

3485. You paid for your space at Paris, did you not?—Yes.

3486. And you paid for your transport?—Certainly, and very heavily, too.

3487. And for the decoration?—When you get your machinery you find the flooring is no use, and you must put boarding down. It is a sort of match-boarding, and you put it all in new. Then there are delays and all that sort of thing, and there does not seem to be anybody pulling the ropes properly. It is hopeless sometimes, and people get tired of it, and say, "We will not exhibit any more."

3488. But they do?—No, *they* do not. Some do.

3489. You have?—Yes— never say die, but still hope for better things to come.

3490. But you think there is a great want of proper organisation?—Yes. I should like to see Great Britain come forward in a bolder, larger, more majestic manner. Look at this immense empire. Did you go to the 1900 Exhibition in Paris?

3491. Yes?—Were you satisfied with the way Great Britain was represented?

3492. I am afraid I have got to ask you questions, and I am not in the witness chair myself?—If it is all to come from me, you will pump me dry. You know it was not noble; it was not good enough.

3493. But you will grant that the exhibits must come from the exhibitors?—Yes.

3494. The Government cannot supply the exhibits, except out of the hands of the manufacturers here?—That is so. I do not mean to say anything inconsistent with that.

3495. I understand you suggest that if we had a better organisation we should attract more exhibits?—You would. You should get some of the industrials on the committee. I assure you I do not want to get on; I have got quite plenty to do.

3496. But you think we might have a better and a stronger committee?—Yes. Then I think the Government ought to vote larger sums of money to uphold the dignity of the Empire. Take our receptions now and again, and the conversaziones. I went to one at Milan. Of course, there were attendants at the door with the name Germania on their caps, and they were in uniform. Practically German was the language that was spoken there. These people actually went to the trouble of bringing the best opera singers by special trains from Berlin. France did something similar, and so did Austria, but of course England was not in it. I do not say it is necessary; it does not pay your dividends in your business, but it will pay your dividend to the British Empire. It is no use to be always parading yourself as a nation that does not take any interest in these things. It is no good. If you have something in you you must show it. It is too paltry.

3497. Do you think that we should have spent money in bringing opera singers to Milan, and in so making the thing more attractive?—Do not take me, please, like the Bible, by the letter. I only give you a sort of instance. I do not mean that you should do that at all. You might as well say, Do you think we should have a pair of boxers on the stage? I do not mean that. But look to our way of having a reception or having a pavilion—a paltry little thing—yes, it had the English coat of arms on it, but it is not good enough for Great Britain. It ought to be something majestic. It is not representative of an Empire with our vast colonies.

3498. But surely we spent a very large sum on our pavilion at Paris and elsewhere?—How much?

3499. £30,000 we have been told?—It seems a lot.

3500. You do not think it made a good show?—I do not think so. Of course, you are asking for my criticism, and you must take it for what it is worth.

3501. Certainly, we want your criticism and your advice?—Thank you.

3502. (*Mr. Harris.*) I think we at this table rather have to look at exhibitions from the point of view of the return they may bring for the money the State spends on them, assuming that it does spend money?—Do you mean by the individual exhibitor, or by the Government?

3503. By the Government for the moment. When you talk of a large exhibit worthy of the British Empire, do you think that it would really pay the British Empire from the point of view of the trade which it would bring to the country?—Yes, I do; because you would stimulate the industrial, the producer, the manufacturer, to greater exertions. You would give him an opportunity to show his wares at these exhibitions, and attract the attention of buyers, instead of leaving it to the other competing nations who are there to do so.

3504. Did I not understand you to say that although you exhibit almost everywhere, you cannot trace actual sales to your exhibitions?—I did say so. I was speaking of your exhibits that are there, the things that you do exhibit. You may have sales in an odd case.

3505. Did you not go further than that and say you could not really trace any business that arose out of an exhibition?—We were talking then about individual sales.

3506. Not orders?—That is a different question.

3507. Then we will take orders?—Orders certainly, and expansion of business we can trace.

3508. You can trace expansion of business to exhibitions?—Most certainly we can, or else we should not have gone on with it.

3509. If that is true, as a rule, of exhibitors, are you not using an exhibition really as a means of advertisement?—Yes. But the word "advertisement" is rather elastic, is it not? You can either do it in a paper, or you can show.

3510. We will say a means of pushing the trade of a firm?—Yes, certainly.

3511. In that case, do you suppose that we are justified in spending money upon supporting such an arrangement?—I do, from the simple fact that you can bring more trade to the country.

3512. You would not be glad to be relieved of the necessity of exhibiting by a sort of general agreement to stand out of exhibitions altogether, I suppose?—No, I would certainly not. I grant you it is a big expense—that is quite true. If that idea would refer to England standing out altogether, then I say I hope I shall not live long, because I think it would be disgraceful for a country like England, and I hope it will never come about.

3513. I should like very much to ask you a question about one phrase which you used. You said, I think, that you would like to work up machinery equally good to that of the Americans?—I beg your pardon.

3514. I think you said in one of your answers to the Chairman that you had in view, as an ideal for your firm and others, to learn to turn out machinery equally good to that of the Americans?—No, I did not say that, excuse me.

3515. I thought you said something of the sort?—Something of the sort it may be, but not of the Americans at all.

3516. You did speak highly of the American machinery, did you not?—I did not.

3517. You did not?—I spoke of their inventions.

3518. But not of their machinery?—I will back an English engine any day against American engines.

3519. I wanted to get that out of you, but I understood your statement the other way?—We copy their brains if we can, but we do not copy the way they make it.

3520. That is just what I wanted to get. I did not understand your remark?—You take an English loco-

motive, and you take an American; the American is done for in eight or ten years, and the other one is good enough for thirty years. The other day I was in Italy, and, would you think it they were very pressed for locomotives, and they bought, I think, 30 Midland Railway second-hand locomotives, and they are running there to-day, and considered good. We copy their brains, Sir.

3521. Was it not worth your while to go to the St. Louis Exhibition and exhibit these big engines, and show the American that, after all, you have a thing that will last out two or three of his?—It is a very nice idea, and very philanthropic, but you know it touches our pocket. If they want to see what we are doing they can have our catalogue, and come over. Only the other day we had a letter from an American firm who are strong competitors of ours in the Argentine. With a sort of cock-and-bull story, they said they thought there was a lot of business to be done in our engines. I wrote them back, "If you want to copy one we will sell you one, but if you tell me you can do business with them in America, with a 45 per cent. *ad valorem* duty on it, then here ends the correspondence." I have not heard again, and do not expect to.

3522. I am only going to trouble you with one more question, and that is again about America. You stated that at Paris the American show was enormous and extraordinary, or words to that effect, but would you mind explaining what you mean by that?—I did not refer exclusively to America. But I said that countries like the United States did show on a far larger scale in a broader way than we did by a long way. You will pin me down to America, but have you been to this exhibition? Perhaps I ought not to ask any questions.

3523. No, I have not?—Well, take, for instance, the American harvesting machinery exhibit. It was simply magnificent; it was beautiful. Now, you know the Americans could not do that out of their own pockets; they must have had some subsidy from their Government. Their show cases were made in a magnificent way, and they were all uniform. With the Germans it was the same. We will take the Fixed-engine Section of Germany; all the railings were made to one uniform handsome pattern.

3524. Do you feel any harm done to you by this grand show, as a practical matter?—I feel sure it does us harm. Excuse me saying so, but the horizontal engine exhibit of England was a poor thing. I want English exhibitors to go more to these shows, and to learn a lesson, and to come away ashamed of themselves—that would be sometimes to their own advantage.

3525. Did you show any horizontal engines?—We did.

3526. Do you mind explaining why, when a great firm like yours was showing, you can admit that it was a poor show?—Why, because you have to be honest in these matters. Do you take our individual exhibit, or the British exhibit collectively?

3527. I was taking your individual exhibit?—I say our individual exhibit was a beauty, for the matter of that. We spared no expense, and we were in three sections. I tell you we were in the Agricultural Section, and the Industrial Section, and the Section for Public Works. There were, perhaps, Galloway, Robey, Ruston and Proctor, and Hick, Hargreaves and Co. I believe there were half a dozen of us. But I should say that the French engines and the German engines were whoppers, tremendous things, and they had a beautiful stand. You know we felt a little bit small after that.

3528. Was that not a matter of want of arrangement, or was it a failure to show the best things?—It was a failure to show the best things.

3529. (*Mr. Malcolm Ramsay.*) I gather that you have exhibited at practically all the big foreign exhibitions?—The principal ones, yes.

3530. Is it the case that in considering whether you will exhibit or not, you do not attach very much importance to the question of there being a Government grant for the representation of British exhibitors?—No, I have not considered that.

3531. I mean to say that this has not been a consideration which induced you to exhibit, or induced you to abstain from exhibiting?—It has not been so at present. As a matter of course we should treat it on its merits when the time comes round for another exhibition.

3532. In the past you have exhibited pretty impartially at exhibitions which have had a Government grant, and at exhibitions which have had none?—Yes. Might I just here interrupt you? Let us go back 15 years for a moment, when England practically was the purveyor in machinery to all the world. That is not the case now. I do not attribute that exactly to exhibitions. The exhibitions that have taken place during the last 15 years are only a few in number, but they have shown us that countries like Germany and the United States—even countries like Hungary, Italy, and Switzerland—have come forward tremendously. I may tell you that one of the finest fixed horizontal engines, studied to the greatest economy both of steam and of coal, is a Swiss engine made in Switzerland—and they have not got an ounce of coal there.

3533. I suppose you attribute that to other reasons than exhibitions?—Quite so; but if you stop at home you will never learn, and the country must make some effort to come forward or else we shall be left alone, I can assure you.

3534. You exhibit from purely business motives?—Yes, not for the sake of health.

3535. I mean rather that you do not exhibit from patriotic motives so much as from business ones?—That is so. The English flag on your stand is very nice, you know, but still you go there for £ s. d., if possible—in the future, mind you—because you have to spend a lot of money to show.

3536. May I put it to you that your trade is one which has a certain peculiar adaptability to exhibitions, and that there are many other trades which stand to gain much less by exhibiting at foreign exhibitions than you do?—Yes, there are some. If you will specify them I can answer you at once, no doubt.

3537. Do you think the makers of textile machinery stand to gain by exhibiting abroad as much as you do?—I quite believe that.

3538. I ask, do you think they would?—I do. Look at the machinery that is bought now—textile machinery made in England. It is wanted everywhere.

3539. Can you explain why, as I understand, the makers of textile machinery are rather reluctant to come forward?—I cannot tell you, because I am not in that trade. I might offer an opinion which is not worth anything at all; I do not know.

3540. Do you consider that there are great differences between trades, and that some would gain a great deal more from exhibiting at exhibitions than others would?—What would others lose?

3541. Their products are not such as can be conveniently exhibited; they are large, heavy goods?—That does not stand in the way at all.

3542. And they are not likely to get direct orders?—That is no objection at all. Take, for instance, a firm like Krupp. They exhibited at Paris and at the Düsseldorf Exhibition. Their exhibit was simply enormous. Look at the enormous guns and the tremendously heavy armament that was transported there. That is no impediment at all.

3543. I fancy there were probably special reasons why Krupp exhibited?—I do not know; but why does not Armstrong exhibit in the same proportion? Krupp had a magnificent exhibit in Milan. Italy is a maritime nation, as you know. England exhibited a little bit—models of ships. But side by side with Germany, England makes a poor show, and I remain of the opinion that it is undignified.

3544. Is it your experience that British industry has ever been completely represented at any exhibition which you have attended?—No, I should think not—not to my recollection.

3545. Our show has always impressed you as less good?—Dots—a little bit of this and a little bit of that; but not sufficiently representative.

3546. You were speaking just now of the backwardness of the British Government; may I suggest to you that one reason why our exhibitions are not more successful is the apathy of the British manufacturer in regard to exhibiting?—Is that so?

3547. We have been told by witnesses that they have had very great difficulty in getting exhibitors to

Mr. A. Bornemann. 28 Feb. 1907.

come forward. For instance, at Paris in 1900, they tried many ways, and it was only with great difficulty that they induced exhibitors to come in and get enough to make up a show at all?—What was the reason they gave?

3548. I was asking you whether you agreed that there was apathy among the British manufacturers?—You see I was not on the committee of the exhibition.

3549. I was only asking you if you had any experience of that?—I know several who said: "We shall not go."

3550. I was suggesting to you that the Government might do its best, but still it requires to be met by a greater keenness on the part of the industrials, and that the effort cannot only be on the part of the Government?—My dear sir, would you rather walk in a procession with a band at the head, or would you walk in a procession without a band? But I have no right to ask you a question; I am so sorry. That is my view of the matter—that your Government should come out and show first of all in an official manner an exhibit worthy of this immense empire; then you will get your rally of your industrials, and they will be proud to go, and then we shall beat the Germans and the Americans, and we shall show there is still life in the old dog, and that we can make everything as they do. Bring your people out and let them see what the other people do.

3551. I was suggesting that the manufacturers have not as a matter of fact shown any keenness to come forward as a body, in spite of the large grants which have been given them—take, for instance, the Paris Exhibition of 1900?—May I ask you, is this International Exhibitions Committee of long existence?

3552. (*Chairman.*) It was appointed in November, 1906, and we have sat ever since?—I think it is a very wise step, if I may express my humble opinion, and a very necessary step.

3553. (*Mr. Malcolm Ramsay.*) I should like to ask you one more question. Will not the item of floor space, to which you alluded, form a very small item in the total expenditure that you have to incur in exhibiting abroad?—It will soon amount to a couple of hundred pounds, you know; and then, of course, there is the decoration.

3554. The total cost might be £1,000, or more?—Yes.

3555. I think you mentioned £3,000 in one instance?—Yes, the Paris Exhibition of 1900 came to that. You have to decorate your stall, you have to put a floor in, and railings, and flowers and palms, and all that sort of thing, to make it very attractive—it all costs money. Then, of course, you pay frightful prices at an exhibition. If you want a carpenter, just to put a little bit of a floor in, you will find the nails cost you perhaps 4d. each, or something like that. It is very expensive.

3556. (*Mr. Algernon Law.*) May I venture to ask whether you were educated in this country?—I was not. I was born in Amsterdam. I am naturalised.

3557. Did not Armstrongs exhibit at Milan as an Italian firm? They have Italian works, have they not?—There was another firm, I forget the name—I think it was Armstrong—but they only showed two guns.

3558. And Vickers, Maxim, did not they exhibit?—Vickers, Maxim showed, but they only showed two guns.

3559. I think Mr. Ramsay asked you some questions about that. It is not surprising, perhaps, for a maker of armaments to send exhibits, because that is the best way of bringing his goods before Governments. It is not done, in their case, to bring private trade, because there is no private trade in their manufactures, is there?—No.

3560. The bringing of heavy guns to an exhibition is a very different case to the bringing of locomotives, say, is it not?—Quite so.

3561. Do you not think there are reasons why locomotive manufacturers should be reluctant to come forward, for instance, on account of the heaviness of their goods, and the difficulty of transporting them?—Yes, perhaps on account of the duty and the difficulty of the transport, but that, after all, is not such a great item.

3562. These goods go duty free to the exhibition, do they not?—The goods at an exhibition, as a rule, are in bond until they are removed.

3563. The case of locomotives is an instance where a manufacturer is not likely to exhibit because the cost is too great?—I do not quite follow you.

3564. We have had it in evidence that though a great locomotive manufacturer did exhibit in the United States at a cost of £3,000, he got no benefit out of it?—Was that an English locomotive manufacturer?

3565. Yes?—They do not want his engines in America, and he need not have gone there. They would put 45 per cent. *ad valorem* on; that is, if you put £45 on £100's worth of machinery imported, you can quite understand that it is simply impossible to do business.

3566. Would you rule out the United States, then, as being an instance which one would make a kind of exception?—Yes, I would. In all other countries we are all alike, and we are all in the same boat. For instance, at Milan the exhibits of the Belgians in waggons, carts, and locomotives were something enormous; the Austrians the same, the Hungarians ditto, the French ditto—they were all there.

3567. Why is it worth the while of the German manufacturer to make a great effort to exhibit at St. Louis, when you yourself were not disposed to go to St. Louis, and you quite agree that a locomotive manufacturer should not go there?—I cannot tell you why the Germans went there. I do not even know which firm you are referring to. Perhaps their representative wanted a holiday.

3568. Do the other Lincoln firms which you have mentioned exhibit at foreign exhibitions?—Yes. I cannot, of course, say whether they go to every one.

3569. I forget whether you noticed any difference between these classes at an exhibition where there was a Royal Commission, with a large sum of money to spend, and at an exhibition where there was not such a sum?—Has there ever been one with a large sum of money to spend?

3570. It was over £100,000 at St. Louis, and it was over £100,000 at Paris, too?—We did not go to St. Louis.

3571. But you went to Paris?—Over £100,000 there?

3572. Yes?—My goodness! What have they done with it? They might have bought us the gold medals out of the £100,000. We had to buy them ourselves.

3573. (*Mr. Wilson Fox.*) You said that England, in showing her goods abroad, generally made a poorer show than Germany?—Yes.

3574. Do you put that inferiority of British exhibits down to the superior organisation of the German Government, or to the lack of keenness on the part of the British manufacturer to show?—I should say most certainly to the superior organisation of the particular country which invites their manufacturers to show. If you do that, you make your manufacturer more keen to exhibit and to go to that expense.

3575. Do you think that, with a better organisation here, and with facilities for putting before a British manufacturer the advantages of exhibiting, we should get more manufacturers to join in these exhibitions?—I am absolutely certain of that. That is my humble opinion.

3576. You do not think at present that the British manufacturer appreciates the advantages which may be derived to his business as an advertisement when showing abroad?—That is a very broad question, you know, very. I believe there has been for some time a sort of mistaken idea amongst several British manufacturers that they were afraid they were going to be copied.

3577. That would be particularly the case in some lines of business, would it not?—In some lines; but I do not think that we have very much that we can give away; I think there is very much more scope to acquire.

3578. That is, for a sharp business man to acquire?—Most certainly.

3579. I understand from your evidence generally that the manufacturers in the line of business which you represent do show in foreign exhibitions a great

deal more than certain other lines of manufacturers?—That is possible; it may be so.

3580. From what you see at exhibitions there has generally been a certain number, at any rate, a considerable number, of the leading agricultural manufacturers showing, has there not?—Yes; but we also exhibit at industrial exhibitions, such as the last Glasgow Exhibition, and so on.

3581. You stated a fact which I am extremely glad to hear, namely, that the English agricultural machinery is of the best quality?—No, I did not say that. You must not take that from me. I say that we should not always like to copy him.

3582. I may be wrong, but I certainly understood you to say that the machines themselves which we make here are of the best quality?—Yes, *our* machines.

3583. Do you find that in showing those machines abroad, which are of such good quality, there is a demand abroad for the best quality of machines; or do you find that foreigners prefer to buy a cheaper class of machine of a second-class quality?—"Abroad" is a very big order, and "foreigners" is a very big order. There are markets in the world where this pencil if it costs a farthing people will buy it, and there are other countries that would not look at it unless it cost twopence. Take the Indian market, for instance.

3584. I will not follow that up, but I will put it to you that you find in your business that it is best only to show the best machinery?—We do not make any other. We do not make second-rate machinery.

3585. That is the answer that I wanted to draw from you. Therefore you leave to other people, we will say to this large order of foreigners, the benefit of selling the second-class machinery?—Yes. You talk about agricultural machinery.

3586. I talk about it because you are here to give evidence upon it?—Pardon me, we only make threshing machines and portable engines, we do not make harvesting machinery or ploughs, and these things are all combined under "agricultural machinery," and yet they are things which we do not touch. Let me just tell you as an instance that the American harvesting machinery is the best in the world, and even if you were to put a duty on it, it would still be bought in this country.

3587. Do you find that in selling this English machinery, which I am glad to hear you say is of the best quality, the tariffs have interfered with the sale of it?—Yes, the tariffs have.

3588. Also I understood you to say that the competition which has arisen in the last fifteen years has interfered with it, and that other people are making this machinery?—Decidedly. Other nations have come to the front. Of course, a great many of these men have been taught in England, and then they have gone away and improved on it, and found there was a demand for such stuff and started making it. We will take the United States, which are self-contained; America has every blessed bit of raw material within herself, and she, of course, manufactures. It is the trend of the times; it is progress.

3589. But still you, at any rate in your business, which is a first-class one, have learnt something from the foreigner?—Most certainly, and we do every day—I do not mean every day, but still we do, and there is not an exhibition where I do not send our works manager and a foreman to it. They always find something. Either a Hungarian, or a Frenchman, or a German, or an American, whoever he may be, he has something which we have not got, and if we acknowledge that that is a good thing, very well, we will adopt it. In the same way if these fellows find that we have something, well, you cannot help it, and you cannot stop them, except when you have protected it by a patent.

3590. The question has been raised several times before this Committee as to how many exhibitions a large manufacturer would be prepared to show in over a series of years. I should like to know your opinion about that. What is the limit of the number that you would care to send to? Supposing there was a big international exhibition every five years, or three years, or seven years, what would be your view of that?—Once in ten years is quite sufficient.

3591. That would be quite often enough to answer your purpose?—Yes, I think so.

3592. Would that be because there would not be any new invention to show in the meantime, or what would be your motive for suggesting it?—First of all, the expense is a very great one, and I should say that once in ten years is really sufficient, because you have so many other little exhibitions in the meantime.

3593. But you would be sending in the meantime to the smaller exhibitions, would you not?—Yes.

3594. That would include the ones you sent to in England?—We send here, for instance, to the Smithfield Show and the Royal Agricultural Show, but I should very much like to do without it.

3595. Yet you cannot afford to?—We cannot stop at home, unless we all say that we will do so—but then they won't.

3596. In the meantime, in speaking of small exhibitions, you are referring, I take it, to the English ones, the agricultural exhibitions?—Or to foreign ones.

3597. It may cost you almost as much to show at one of the small exhibitions as at a large one?—Yes, but we should never show at a small exhibition on such a large scale as we have shown at an international exhibition. We should not show in two or three sections. We had one here, for instance, at Earl's Court, but we only showed mining machinery and winding engines. If we go to an electrical show, we would show a high-speed steam engine for a dynamo, perhaps, and if we were to go to an agricultural show you would know what we should send there.

3598. For a firm that spends so much money as you do—and naturally so with the heavy class of goods you exhibit—you expect, of course, when you go to a large international exhibition to find the British organisation good and complete, and to find that you are given as little trouble and friction as possible?—Yes.

3599. That is what you would wish for as a British manufacturer?—Yes, I have the modesty to expect that.

3600. And I may put it that that is the least that you could expect in a large international exhibition?—Certainly.

3601. You would not expect any direct contribution from the Government towards your expenses?—No, I do not think we individually should. We are not a poor firm, and we could afford it. But you must admit that when you get your agents over from Australia or New Zealand, and when you get English residents in foreign countries coming, they will say, "Good gracious! look at that poor show; where is England? Now look at the Germans; at the Americans." That is continually said, and it is not nice.

3602. I rather take it that you put it down really to a question of organisation?—Yes. If you have better organisation it will be a fillip to English industry. That is my opinion.

Mr. Frederick Hooper, called and examined.

3603. (*Chairman.*) I think you are Secretary of the Bradford Chamber of Commerce?—I am.

3604. And that you have held that position for some years?—Yes, for seventeen years.

3605. The Bradford Chamber of Commerce has sent collective exhibits to several exhibitions, I think?—Yes. We sent exhibits to London in 1862, to Paris in 1867, to London in 1871, to Sydney in 1878, to Calcutta in 1884, and to Paris in 1900.

3606. What is your opinion about the effects of any particular exhibition on British trades, so far as industry is concerned?—It is somewhat difficult to gauge the effects of any particular exhibition, but so far as the woollen and the worsted trades are concerned, the

Mr. F. Hooper.

28 Feb. 1907.

general opinion is that recent exhibitions have had no effect whatever, beneficial or otherwise. As regards other trades, it is difficult to speak positively, as so little is known as to the general results. The same remark applies to the effect of exhibitions on our commercial relations with other countries.

3607. If that is so, you cannot tell us any particular industries which have benefited at recent exhibitions?—No, I am afraid not.

3608. In Bradford you have got a good deal of manufacturing, have you not?—Yes, we have.

3609. Have your products not been exhibited?—Yes, they have.

3610. Do you know of any advantages to the makers from exhibiting?—Up to, say, 30 years ago most classes of industry probably benefited more or less from exhibitions, because up to that time foreign nations were practically non-competitive.

3611. But in the natural course of events foreigners began to make things for themselves?—Yes. After the Franco-German war of 1870-71 they became much more active competitors, and I should say that since that time the trades which have chiefly benefited would be the engineering and machinery trades, particularly articles such as motors, pumps, and engines generally.

3612. Of course in Bradford you do not know much about the earthenware and pottery trades?—No, we have nothing whatever to do with trades of that kind.

3613. Then as regards the disadvantages of exhibitions due to copying, and so on, you probably have not anything to say?—A director of one of the largest silk mills in Bradford—I believe it is the largest silk mill in the world—told me that his concern had exhibited at some eight exhibitions and that they had suffered very severely from it. He stated that they would have nothing more to do with exhibitions.

3614. That was because his patterns had been copied?—They had been copied right and left, he said.

3615. I think patterns are protected, are they not, in most countries in the case of samples exhibited at an exhibition?—They are now, but I do not know whether they were then.

3616. Registered designs surely are protected now in most countries, are they not?—They may be nowadays, but might not have been in former days.

3617. Your friend's experience was some years ago, I take it?—Yes.

3618. Do you consider that the direct commercial results of exhibitions would warrant the Government in giving grants in the future, so far as textile productions are concerned?—So far as textile productions are concerned, I should say they would not.

3619. As regards the indirect effects?—As regards the indirect effects I think they might. A point arises there. Are the direct commercial results the only ones that should be considered in a case of this kind?

3620. I am asking you as to both—first of all the direct and then the indirect results?—Take the indirect first. Supposing another great exhibition were to be held, in Paris or New York for instance, under the patronage and with the support of the Government of the country concerned, would not the absence of British manufactures from such an exhibition, or the refusal of His Majesty's Government to recognise its importance, have a prejudicial effect upon our commercial prestige, and incidentally, perhaps, upon our political influence?

3621. Do you think it would?—I think it would; and notwithstanding the possibly negative results of previous exhibitions, I hold that in view of the considerations I have just named it would not be politic for this country to refuse to take its proper share in an exhibition favoured and supported directly by the Government of the country in which it is to be held.

3622. Assuming that public money in any case is granted for the organisation of official exhibits, do you consider that the grants which are made should be subject to any special conditions?—I do not quite understand what is meant by "official exhibits." So far as I know the British Government have never done anything in the way of organising exhibits. Of course, they have organised the British sections of exhibitions, but what have they done in the way of organising official exhibits?

3623. A collective exhibit is more or less an official exhibit. The Germans have gone in for collective exhibits?—I thought your question referred to the official exhibits of the British Government.

3624. Of course, in another way there are official exhibits—that is, exhibits from several public offices, such as the Board of Education and the Labour Department of the Board of Trade, and so on?—I am aware of those exhibits.

3625. My question refers both to the exhibits of departments, and to the German, and, I believe, to a certain extent, the French system of combined exhibits?—Combined exhibits have never been formed in England by the Government.

3626. Your combined or collective exhibits have been Bradford exhibits, have they not?—The combined exhibits of Bradford and other places have not been organised by the Government.

3627. But they have been organised by the local bodies?—Yes. I believe that the Governments of Germany, Switzerland, and possibly other countries have organised such exhibits, but the British Government has not.

3628. Would you make the Government grants for exhibitions conditional upon getting adequate space for British exhibits?—Yes. I think any grant made ought to be conditional upon the British Government receiving an adequate allotment of space, and I think that that space should be in a favourable position. At the last Paris Exhibition, for instance, French exhibitors were allotted more than half the entire space available in each section, and all the other nations—I think they were some 50 in number—had to take what was left between them.

3629. Then you would like some condition to be enforced to the effect that we should have a proper proportion of space kept for us before we agreed to take part in an exhibition?—I think that would be advisable. I know that the Bradford Chamber were hampered very much at the Paris Exhibition because we could not get the amount of space we wanted.

3630. Did you protest then?—We did not protest. We asked for 1,000 square feet, and were afterwards told that we could not have more than about 600 square feet. The consequence was, that we had to crowd our exhibits more than we otherwise should have done.

3631. Did that spoil the decorative effect?—It had a very detrimental effect upon our exhibits.

3632. Then there is another question to be considered, namely, whether the grant of public money should be, to a certain extent, dependent upon the number of people who come forward to exhibit?—I do not know about the number of people, but I certainly think something ought to be done in the way of selecting exhibits. I think all exhibits tendered ought to be, as it were, put through the sieve, and only the best selected. It is not desirable that everyone who chooses to send in a small exhibit to an international exhibition, merely as an advertisement, should be allowed to exhibit as a matter of course.

3633. Who would you make the authority for that selection?—It depends upon who would be the supreme authority of the exhibition. It would be left to them to appoint sub-committees, I take it, to look after these matters. It would be a matter of detail to be settled afterwards. I do not know exactly how it was done in Germany, but probably most of you gentlemen were at the Paris Exhibition, and you will remember, no doubt, how the German exhibits dominated nearly every department. I have been trying to find out how that was done. I got a report on the German exhibits, and found that the whole management, so far as I could ascertain, consisted of about sixteen men who were appointed by the German Emperor.

3634. We have had some little evidence, and we are going to have a good deal more, on the German and French systems; but of course you are quite right in what you say—that there was a sort of preliminary examination, which went on for two or three years, and the German Government said what should and what should not be exhibited?—I believe that was so.

3635. Would you like some sort of system of that kind?—I think it would be advisable. Exhibitions are very different now from what they were some thirty years ago. The Germans showed us a new way of exhibiting at Paris. They exhibited only the very best things that could be procured, and I believe the

men who were in charge of particular industries had instructions that they must make the exhibit the very best that was possible.

3636. So far as we have gone, we have found that the machinery people in certain branches seem to go on exhibiting very freely, but that when we come to the textile branches there seems to be a disinclination to exhibit; is that your experience?—There is a very great disinclination to exhibit textiles.

3637. Why is that?—There are several causes. First of all, in this country textile manufacturers do not export their own goods. That business is done almost entirely through the merchants. Then, again, textiles are in a different position from most other productions inasmuch as the demand for textiles depends very largely upon fashion. For instance, dress goods exhibited in the spring would, in all probability, be out of fashion by the following autumn, and *vice versa*. There would, therefore, be little advantage in exhibiting such goods. If a manufacturer were to exhibit a novelty which he thought would probably take the public fancy during the next season, that exhibit would be copied, probably in cheaper material, and the man's market would be spoilt. Another point is: Supposing I were a printer, and saw in an exhibition a new printing machine which I thought would suit me, I could buy one of those machines with the certain knowledge that I should be able to use it for ten, twenty, or thirty years; but, on the other hand, if I were to see certain dress pieces which I thought would sell very well, and were to order a number of such pieces, by the time I got them they would probably be out of fashion.

3637*. The fashion changes as quickly as that, does it, as regards Bradford goods which are mainly dress goods?—In most kinds of dress goods the fashion changes every season practically.

3638. How do the Bradford dress goods manufacturers extend their markets?—All the merchant firms in Bradford have travellers who visit every market in the world. Patterns are made in advance, and are taken out by these travellers and shown to probable customers all over the world. That is the way the business is done.

3639. And if a particular pattern is well received, he sends orders home?—Yes.

3640. To repeat and repeat?—Very frequently.

3641. I suppose he can easily take about with him plenty of patterns?—Yes. Patterns half a yard long, or even smaller, would be sufficient to show the pattern and style of material.

3642. That is so with dress goods, and with tailoring goods, too, is it?—It is so with most kinds of materials for men's and women's wear.

3643. So that there is no inducement practically to exhibit the patterns?—Not to exhibit textiles.

3644. I mean there is no inducement in the interests of the reputation of the firm?—If a manufacturer were to exhibit, he probably would get no benefit from exhibiting, the business being done through merchants. If a manufacturer were to exhibit, and a buyer saw the goods and wanted to procure some, he would order similar goods through a merchant, and, possibly, the actual manufacturer who produced the exhibit would not get the order, as it might go to a rival manufacturer. Very few manufacturers in the Bradford district do a direct foreign trade.

3645. So that the goods are not sold by the name of the manufacturer at all?—No; it is the merchant who sells them generally.

3646. And he gets them where he can get them best?—Yes.

3647. That is the way Bradford goods go into the market?—Yes. When the Bradford Chamber of Commence formed a collective exhibit for Paris in 1900, we spent nearly £2,000 on it. We really did not expect to derive very much material advantage from it, but thought it would uphold the prestige of the city as a manufacturing centre. That was our principal object in exhibiting.

3648. So there is no doubt about that—you want Bradford to stand high?—Yes. We thought it would not look well for an important place like Bradford to be unrepresented when the French and Germans and other nations were exhibiting goods similar to those which we make.

3649. Now, to pass to another subject, have you any opinion about the advantage or otherwise of giving awards at exhibitions?—I cannot say that I have considered that. So far as textiles are concerned, the principal advantage of an award is that a man is able to advertise on his letter paper or invoice heads that he received a gold medal or a silver medal at such-and-such an exhibition. I do not know that there is any other advantage from it.

Mr. F. Hooper.

28 Feb. 1907.

3650. Would that be an advantage for a manufacturer when getting orders from his merchants?—It would perhaps in other trades, but not in the textile trades.

3651. Do you think that those goods are sold on their appearance?—They are sold on their merits.

3652. Because they seem to fit the tastes of the day?—Yes. Fashion and tastes change so constantly that the goods have to meet the demand of the time. A man cannot trade on his past reputation.

3653. Are you holding your own in the face of French competition in new patterns of dress goods now?—The French goods used in England are not quite the same as we make in Bradford. The process of manufacture is different, and we really do not produce such goods—at least, we did not until quite recently.

3654. I thought you did now?—The Chamber of Commerce appointed a committee to investigate the question. That committee sat for about three years, and stimulated the manufacture of similar goods, but the production is still very small compared with the imports. We hope in time that we shall do better.

3655. I will not take you further on that point; I ought not to do so. As regards the organisation of exhibitions, do you think that a Royal Commission is the best method of dealing with them?—A Royal Commission seems to be too unwieldy and too large altogether to deal with a matter of this kind.

3656. But Royal Commissions act through committees of their own body, and take in other people—experts—do they not?—Those committees do not meet very frequently, I think.

3657. I asked you what you thought of them?—I do not think they are of much practical utility.

3658. What should you substitute for a Royal Commission? You would have Government control of some sort, I suppose?—Certainly. My impression is that commercial men would have much greater confidence in an exhibition if it were managed by someone who was in touch with commercial affairs, such as you, Sir, or Mr. Wilson Fox. What I had in my mind was really the Board of Trade Advisory Committee on Commercial Intelligence. You have there a committee representing all the trades in the kingdom, and if it could be induced to take up a matter of this kind I think it would have a very beneficial effect.

3659. They could keep in touch from exhibition to exhibition through a very small nucleus staff, I take it?—Yes. That Advisory Committee, I take it, would be kept alive from one exhibition to another. I think it is intended to be a permanent committee.

3660. At any rate, you think that body should be in connection with, or in close touch with, the Advisory Committee?—Yes, I do.

3661. And there should be on it some persons who have had dealings with commercial bodies all their lives?—There should be on it someone who is in touch with commercial bodies, not necessarily someone actually dealing with them at the time.

3662. Do you think that more money would be wanted, or less, than the present expenditure?—It depends upon what you do with the money. If you were to make grants to chambers of commerce and other bodies, for instance, for the formation of collective exhibits, you might want more money. I do not know exactly how the money has been expended in previous exhibitions.

3663. Do you think that we should get collective exhibits from several of the principal industrial towns, if the expenses, or part of the expenses, were paid out of the public funds?—I think you would get them much more readily than you do at present. If, for instance, the Royal Commission, or the gentlemen who are managing the exhibition, could say to a large town like Bradford: "We will give you £1,000 towards the expenditure and provide you with show-cases,"

Mr. F. Hooper.

28 Feb. 1907.

then I think you would get a very good exhibit from Bradford—and from other towns in the same way.

3664. Take Huddersfield, for instance, which is very much interested in tailoring goods, is it not?—Yes.

3665. Would not a town like Hudersfield be likely to take an interest in having a collective exhibit to show what Huddersfield can do?—You mean if a grant were made?

3666. If a grant were made?—Yes, it would.

3667. Do you think that would be the best chance of getting hold of the textile industries?—I think you would get them more readily in that way.

3668. I suppose they would not be large collective exhibits?—It would depend on the town and on the character of the trade. Huddersfield, for instance, produces only two or three different makes of goods, whereas Bradford makes a very large variety. The Bradford exhibit therefore would be very much larger than the Huddersfield one in proportion.

3669. But still you see more chance of getting town collective exhibits than you would of getting individual manufacturers to exhibit?—Yes. Besides that, collective exhibits lend themselves more to spectacular effect than do individual exhibits, so that it would be an advantage if you could get more collective exhibits. There were very few at Paris, I remember.

3670. Do you remember whether all the names were given in the collective exhibits?—They were not given in the Bradford or in the Huddersfield exhibit—in fact, when we formed a collective exhibit it was arranged that no names whatever should be given, neither merchants' nor manufacturers', and that if any inquiry was made the inquirer should be referred to the merchants.

3671. Do the merchants or the agents object to exhibits by the manufacturers?—Not at all, if the manufacturers wish to exhibit in their own names.

3672. They are not afraid of people going direct to the manufacturers and leaving out the merchants or the agents?—Not at all. As a matter of fact, manufacturers generally decline to do direct business. There are very few manufacturers who do a direct foreign trade.

3673. (*Mr. Wilson Fox.*) I understand that the system which obtains as between the merchant and the manufacturer does away practically with the personal element in showing, as far as the manufacturer is concerned?—Yes, at exhibitions.

3674. And the personal advertisement under that system is absent to a large extent?—Yes.

3675. Therefore, it is no advertisement to the manufacturer that will help him in pushing his goods abroad?—Not at all.

3676. And it is no advertisement to him if the merchant gets the medal?—No.

3677. The merchant would get the medal, would he not?—Yes, if he exhibited in his own name.

3678. It is only a very indirect advantage to the manufacturer in showing, or rather in sending an impersonal exhibit, in that it may induce foreigners to buy British goods generally as against foreign goods?—Exactly. It is for the good of the trade as a whole instead of for the good of an individual firm.

3679. A collective exhibit would be comparatively easy to get up in a district where goods of the same character were largely made, as in Bradford, would it not?—Yes.

3680. But in many trades there is no particular centre for the trade, is there?—That is so—in engineering, for instance, in the leather trade, and so on.

3681. Therefore it would, in such cases, be much more difficult to get up a collective exhibit, and, further, you would not have the patriotic motive on the part of the manufacturers of advertising a particular district, say Bradford?—That would be so in several trades, no doubt.

3682. Therefore the collective exhibit would be only really easy to get up in districts which represent a particular trade?—Yes. No doubt collective exhibits would be most readily formed in the textile industries—wool, cotton, silk, and flax.

3683. But it might be also, might it not, in the smaller steel trades, such as nails, needles, bolts, and nuts?—It might be so; and also in the pottery trade.

3684. Do you think that chambers of commerce, as a rule, would be competent to get up a collective exhibit? I can understand that Bradford could do it, for reasons which we have been discussing, and that Manchester could do it, for reasons which we have been discussing?—I think they would.

3685. I am not saying they would not, mind you—I want your opinion?—Certainly the larger chambers would, but the smaller chambers possibly might not care to have an exhibit for such a small area as they represent. In allied trades, however, the smaller chambers might combine to form collective exhibits.

3686. But you might contemplate that a better exhibit might be got by handing a specific sum over to a chamber of commerce than by having a central body in London, which is not particularly acquainted with the trade?—It would have to be left to the local body to organise the exhibit.

3687. Would you contemplate that a chamber of commerce, if they had a sum handed over to them, would be more competent to get up an effective exhibit than a central body in London?—I should, decidedly.

3688. You gentlemen in Bradford, I understand, if you do show, show more for the patriotic reason of advertising your town than for anything else?—Yes.

3689. There being no direct benefit to you or to the people there, am I right in understanding that they would not view with favour in those circumstances showing very frequently at large international exhibitions?—It would necessitate a great deal of trouble.

3690. They spent money purely for patriotic reasons and not for business reasons?—Apart from the question of money, there is a good deal of work in connection with getting up a proper collective exhibit.

3691. Certainly; that adds to the force of the argument?—So they would not care to have them too frequently.

3692. Do you think Bradford would be prepared to send in such circumstances as you describe, but not too frequently, a collective exhibit to a large international exhibition?—Bradford people are not favourably disposed towards exhibitions generally, for the reasons already stated, but I think they might occasionally be willing to exhibit at important exhibitions.

3693. As the secretary of the Chamber of Commerce, how often would you care to organise a collective exhibit to send abroad from Bradford?—It depends very greatly upon what kind of exhibition it is. If it is a very important one, for instance, such as Paris or Chicago, we might consider it advisable to have an exhibit, although we had had an exhibit at a previous exhibition some few years before. But with the smaller exhibitions we perhaps would not consider it necessary unless it had been a long time since we had had a previous collective exhibit.

3694. What sort of period of time would you personally care to have between each exhibition as secretary of that chamber? Would you say once every five years, or once every ten years, or what?—It might perhaps be some indication if I were to say that we exhibited in 1862, in 1867, in 1871, in 1878, and then in 1884—that is roughly about every five years. Then we did nothing further until 1900, and we have done nothing since. Ten years, I should think, would be sufficient, so far as the woollen and worsted trades are concerned.

3695. I am talking only about the woollen and worsted industries. You think one every ten years would be sufficient?—Yes.

3696. That would be purely for the purpose of advertising Bradford?—Yes, Bradford and district.

3697. For the purpose of pushing your goods you would appoint travellers, I suppose?—That is done every day.

3698. That is your ordinary mode of doing it?—Yes.

3699. I believe that you have your designs of patterns for fashions ready some years before, have you not?—No, not some years.

3700. They do in some trades, do they not?—They may in some trades, but in the Bradford trade patterns would not be made some years before, but probably

not more than one year before the goods are actually placed on the market.

3701. I thought that sometimes in Huddersfield it ran as long as two years in the case of the designs?—It may be two years there, but very seldom is it as long as that with us.

3702. It is important to your trade not to disclose your patterns until you are just going to put them on the market, I suppose?—It is of very great importance not to do that.

3703. (*Mr. Algernon Law.*) In the case of silk, I should like to know whether it is the goods or the machinery which is exhibited?—The goods alone; the machinery would not be exhibited.

3704. Then the patterns of these goods is that which has been copied?—The patterns and the style of the goods.

3705. But they could not discover the process by which they were made, could they?—They could form a pretty good idea of the process by examining the pieces.

3706. Would you restrict the exhibits in the British section to collective exhibits, where that system is applicable, or would you allow individual exhibits?—would only allow individual exhibits in certain cases.

3707. Would you cut out individual exhibits altogether?—Not necessarily. Some firms would make a very good individual exhibit. For instance, John Foster and Sons, of Queensbury, are large manufacturers of mohair, alpaca, and silk. They had a capital exhibit at Paris, and that was an individual exhibit.

3708. If there were a grant given for the purposes of collective exhibits—if you admit that principle—would you extend it also to the individual exhibitor who would not come in to a collective exhibit; do you think he ought to be assisted?—I think a man who did not care to go into a collective exhibit should bear his own expenses.

3709. Do you think in those cases where a collective exhibit was really not possible, where it was in a branch of trade where you could not well have a collective exhibit, that a grant should be made?—In such cases a grant might be made, if necessary; but if a man were allowed to attach his own name to an exhibit it might be a very good advertisement for him, and he would probably prefer to exhibit on his own account entirely.

3710. Do you think in those cases we ought to pay the freight?—The freight is a very small matter.

3711. That is to say, it is so in textiles and that sort of thing?—Yes.

3712. But in other trades, such as the engineering trades——?—That is a different matter.

3713. Do you think we ought then to contribute in order to form an effective exhibit?—If you found you were not getting suitable exhibits, the only way to get them would probably be by making a grant or giving some assistance.

3714. (*Mr. Malcolm Ramsay.*) At Paris was the collective exhibit mainly cloth? Was there any machinery shown?—No machinery whatever was shown by Bradford.

3715. It was merely the finished goods?—Merely the finished pieces, dress goods, linings, trouserings, coatings, and so on, as well as yarns.

3716. You are speaking here of a very large industry; can you give us, approximately, a figure showing the size of it?—I estimate the total output of the woollen and worsted industries at about £65,000,000 per annum. When the returns in connection with the Census Production of Act are available we shall know pretty well how matters are, but at present an estimate is more or less guess work.

3717. There are other trades which are very much in the same position as the one which you are particularly acquainted with, are there not?—In what respect?

3718. I mean as regards exhibitions, such trades, for instance, as those which are conducted not by the manufacturer, but by the merchant. I suppose the cotton trade is very much on the same footing?—I put all the textile industries together. In the cotton trade I should say manufacturers do a larger trade direct than is the case in the woollen and worsted industries.

3719. I understood you to say that as far as direct commercial results were concerned, the textile industry gets no advantage from the money which has been spent by the Government on exhibitions?—That is what people say. I have consulted several firms who have exhibited, and they all tell me they have never been able to trace any results whatever from it.

3720. Are you able to say whether other trades have had a direct benefit?—No, I could not say as regards other trades, as I have no personal knowledge of such trades.

3721. We have been told by various witnesses that certain trades do benefit?—It is quite likely in the case of machinery, for instance, that they do benefit.

3722. I was going to ask you whether it might not be the case that in giving grants for exhibitions the Government was to a certain extent subsidising one trade, and others were being left out in the cold?—If grants were given they would have to go all round, of course.

3723. I meant to say that participation in exhibitions is not altogether an ideal way of helping the trade of the country all round, because there are certain very large and important industries which can get no direct benefit from such expenditure?—That is so.

3724. Do you agree with that?—Printing machines I mentioned a short time ago. The maker of an article of that kind would derive far more benefit from an exhibition than a maunfacturer of textiles would.

3725. Have you any opinion to express as to whether the grants of public money which have been made to recent exhibitions have been adequate or not?—No, I have no knowledge whatever on that point.

3726. (*Mr. Harris.*) You have indicated that you do not think that exhibitions suit textile goods on the whole. Assuming for a moment that the British Government came generally to the conclusion that the exhibition of these industries did not re-act favourably upon trade, and decided to drop out from exhibiting altogether, how would you view that?—I think it would have a prejudicial effect. As I said a short time ago, both on account of our commercial relations and our political influence, I do not think we could possibly refuse to take part in an international exhibition supported by the Government of the country in which it is held.

3727. Apart from that reason, and speaking as a person who is anxious that Bradford should have a collective exhibit——?—I am not at all anxious that Bradford should have a collective exhibit. I said the principal reason we did exhibit was on account of the prestige of the place. It would not look well for a place like Bradford, which is really the centre of the woollen and worsted industry, not to be represented at an important exhibition like that of Paris, where the French industry was largely represented.

3728. I assume you mean that if Bradford had stood out, it might have lost trade by it?—I would not say it would have lost trade; it might have lost in prestige.

3729. But prestige, I suppose, can be translated into profitable trade eventually, can it not?—Not necessarily. It has something to do with trade, no doubt.

3730. In exhibiting for the reputation of Bradford, or, as I think you put it more generally, in urging that it is desirable to select exhibits, you afterwards suggested a sort of impersonal collective exhibit. What is your view of the effect that that would have upon the smaller firms who are excluded by your process of selection?—I do not think it would affect the smaller firms of manufacturers in the textile industries, because the trade would go to the district, and the smaller manufacturer would get his share. The small man only exhibits as a sort of advertisement for his own little concern.

3731. Do you mean that if you get the district trade properly advertised, we will put it, the small man will get his turn eventually?—Yes, in the same proportion as the large one.

3732. You made a remark, I think, in connection with the Paris Exhibition, that the German exhibits dominated every department?—Nearly every department, yes.

Mr. F. Hooper. 28 Feb. 1907.

3733. Did you form any opinion, first of all, as to the gain which the general prestige of Germany gathered from that, and, secondly, as to the gain which German traders personally would get out of it?—I cannot say what material gain they derived, but there is a very general impression that the commercial prestige of Germany gained enormously owing to those exhibits. I should imagine it would also cause an increase in their trade for certain kinds of goods, for certain kinds of machinery especially.

3734. You did not, as a matter of fact, find that certain British firms thought they had lost trade to Germany?—I have not heard of any such cases.

3735. Continuing your reference to the great contrast between Germany and England at Paris, I think you gave testimony to the effect that the contrast was really painful?—I do not think I said so, but I may have put it in the *précis* of my evidence. That remark, however, applied more particularly to the contrast between the show-cases in the textile sections and the general decorative effects.

3736. Were you aware that the British Government made a grant of £100,000 to support British industry at that exhibition?—Yes, I am aware of that.

3737. Would you suggest that if that money had been laid out more carefully we could have made a better show for the money?—I think so. £100,000 seems a large sum of money for what we saw at the Paris Exhibition. I do not know exactly how the money went, but it seems rather large.

3738. Do you think Germany spent a great deal more?—I do not know what amount Germany spent.

3739. I understand that Germany spent three times as much as we did, so that might account for the difference?—Yes, it might. I should like to add that the views which I have expressed here to-day are mainly my own personal opinions, and are not necessarily those of the Bradford Chamber of Commerce.

TWELFTH DAY.

Thursday, 7th March 1907.

PRESENT:

Sir Alfred E. Bateman, K.C.M.G. (*Chairman*).
The Right Hon. Sir James Kitson, Bart., M.P.
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G.
Mr. Algernon Law.
Mr. Malcolm Ramsay, C.B.
Mr. S. J. Waring.
Mr. U. F. Wintour (*Secretary*).

Mr. Ambrose Heal, called and examined.

Mr. A. Heal.

3740. (*Chairman.*) I think you have been in business some considerable time?—My people have since the beginning of the last century practically.

3741. You have been concerned in exhibiting at some international exhibitions abroad?—Yes. I may say that I have no personal knowledge of the exhibitions previous to Paris, 1900—that is, those from 1851 to 1867.

3742. You know that your firm exhibited in London, 1851; Brussels, 1856; London, 1862; Paris, 1867; Paris, 1900; and Glasgow, 1901?—Yes. Our exhibit from the Paris, 1900, Exhibition went straight to Glasgow.

3743. What were the goods exhibited by your firm, and what was their value?—In every case it was bedroom furniture, and the value of the exhibits was something over £1,000 usually.

3744. Have you had any increase of business with foreign countries which you can directly attribute to the exhibition of your goods and their inspection by visitors at such exhibitions?—With regard to the last Paris Exhibition there was a certain increase at the time, a certain amount of local trade done, but I cannot really say that that has been kept up; it was a sort of flash in the pan, I think. There was a certain number of goods actually sold from the place that we had there.

3745. Did you get business afterwards?—No, I cannot say that we have, not to any extent. Of course the duties and so forth are very heavy on furniture, and that practically prohibits France dealing with us to any great extent.

3746. Still you send a good deal of furniture abroad, I think?—A certain amount, but we do not find that we have done any more since the exhibition.

3747. You have not sent more to Spain and Portugal?—Not recently. As a matter of fact, our foreign trade is very small; we are a retail house, and we do not advertise in foreign countries, except inasmuch as exhibitions may be said to be an advertisement; beyond that we do not advertise.

3748. If you have had no advantages from exhibiting, I suppose you have had no disadvantages?—There is a certain amount of disadvantage, if one may call it so, in a limited way; we take a certain amount of pride in patterns that we have, and take a good deal of care to get individual designs, and that sort of thing, which are thrown open more or less common to everybody who goes to an exhibition.

3749. Your things have been copied occasionally?—Yes, I have found that; I have been absolutely able to trace that in one or two instances. That is a thing one is always open to. Even in the more limited field at home here one is open to that sort of thing.

3750. They can come and see the things in your shop windows?—Yes, and they write for our catalogues and that sort of thing.

3751. You have had awards at exhibitions, I suppose?—Yes, I believe we have at all, or most of them, of one sort or another. I do not know whether they do have any moral influence for good on one's reputation; I do not think they do.

3752. We have heard in some cases they have great influence, but you have not found that so?—No.

3753. You do not put them on a card?—At one time, before I came into the business, they were in the habit of making more use of them than we do now.

3754. Now you do without them?—They were displayed on the notepaper, and that sort of thing, but we really did not think it did any good, and we dropped it.

3755. Have you ever been induced to buy from British or foreign manufacturers to any considerable extent as the result of seeing their goods at any exhibition?—No, I may say we have no occasion to do that.

3756. You have no occasion to do that?—No, there is nothing we want to buy from abroad.

3757. Can you say that you have derived instruction and knowledge as to methods of manufacture or economy of manufacture?—To a very small extent, and that only with regard to this, that one gets hints about a design occasionally.

3758. Are we to take it that you have discontinued exhibiting now?—Since Glasgow or Paris, I do not know whether you call Glasgow an International Exhibition, but since Paris I do not know that there has been much opportunity.

3759. You did not exhibit at St. Louis in 1904?—I did personally, because I belong to a society called the Arts and Crafts Exhibition Society, and I had the privilege of exhibiting something in the collection that they sent out.

3760. That was probably really applied art that you exhibited as shown in furniture?—Yes. You would not take our ordinary exhibit as coming under that heading?

3761. I would not say yours would not, but some furniture I have seen would not?—Quite so. It went out with that label on it.

3762. Anyhow you sent them under that designation?—Quite so.

3763. You have not found the advertisement of exhibiting worth the great outlay?—It is very difficult to gauge what it is worth. Direct results are almost impossible to gauge. The amount of direct business that we did in Paris certainly was not worth it, not worth one-tenth of the expense to which we went, but we hope there was a certain amount of lasting influence which does bring in something, but it is very difficult to check results from any sort of advertising.

3764. I gather that you are ready to criticise, and we are very anxious to hear your criticism, the way in which British sections have been managed and arranged in the past; I think you say also the British sections have been badly managed and badly arranged?—Yes. I must ask your indulgence for rather a hazy memory of what took place in France, because it is some six or seven years ago, but our impression, and I think the impression of other exhibitors with whom we came in contact in our particular section, was that the section generally was not as well arranged as others, particularly the Austrian section. There seemed to be no general idea or scheme for the arrangement of the whole of that section such as other countries were able to institute and carry out. In the Austrian section, for example, there was a decorative screen enclosing practically the whole of that section, which entirely fenced it off from the other countries. When you got inside that screen you knew you were in quite a distinct part of the exhibition; it was different to any other part you had been into. There was a central court there, which was very well treated from an architectural point of view, and off the court were the different exhibits; you entered them, I think, from a sort of doorway, so that really as you entered your impression was of a central hall, off which there were different rooms, and as regards the central hall and the arrangement of the outside screen there was a general idea of harmony about the whole thing.

3765. You are speaking of the Austrian exhibit generally, not only the furniture exhibit?—The Austrian section of the Furniture and Decoration, I think they classified it under Furniture and Decoration.

3766. Of course there was a large glass and china exhibit as well, and there was leather also, if I remember rightly?—Yes.

3767. Was that all done by the Austrian authorities?—It had that appearance. I do not know who else would have gone to the expense of arranging the whole of this hall unless it was done by the nation.

3768. In your own case, did you do what decoration there was?—We put up one of these shanties like most of the other furniture people were driven to put up; that is to say, you had to make your own background, there was no background for standing furniture against; you had to put up your own background, and one naturally built a room of some sort.

3769. Do you think that it should have been arranged by the Royal Commission and their committees in one harmonious whole for all the exhibitors?—I do; it was very haphazard. I daresay you remember the sort of impression that you got; there were all these little chalets or shanties dropped about, and there was no idea of continuity about the whole thing, or any sense of design about the way in which these things were arranged. One could see very well that they all differed so very much one from the other that it quite destroyed any general plan there might have been at the bottom of it.

3770. That brings me to the next question. Do you think that the organisation generally could have been better arranged than it was? Could we have had a better Commission or Committee?—As regards the assistance one got from the Commissioners' office, the people who were there, the assistants to the Commissioners, and so forth, did everything in their power; it was simply amazing the amount of patience they exercised with the number of inquiries that were made, but there did not seem to be enough people about to answer the inquiries. I remember what it was like when you went in there; it was usually the case if you wanted to find out something you did not reckon you could get the information for two or three hours; a butler showed you into a sort of waiting room the first time you went there, after that you dodged the butler if you could and waited about the passages and tried to catch the man you wanted as he went from one department to another.

3771. Who did you want to catch?—The Commissioner or the particular assistant you wanted to see; if you proposed to get to see someone you rather relied on chance than wait your turn; if you took your turn you invariably had to wait a couple of hours or so to get the information you wanted.

3772. You think there was not enough staff?—I do not think so. I know I remember an enormous amount of pressure at one particular time.

3773. I suppose that was when you were placing your goods mainly?—Yes; it struck me that it would have been of enormous assistance to exhibitors if there had been some sort of bureau for the provision of local labour.

3774. At the Exhibition?—In connection with the British Commission.

3775. You mean in Paris?—Yes; people like ourselves were landed there with structures to put up and things to arrange. We took our own woodworkers, and that sort of thing, but one was unable to take over men for every trade. I am thinking particularly now of the plastering we had to get done, a ceiling which had to be put in; we did not take over English plasterers, we took over our own woodworkers, joiners, and so forth, but I remember the great difficulty we had in getting that plastering done, and the terrible way in which we were "done" as regards the price at which we could get it executed.

3776. There was no office where you could apply to get workmen recommended to you?—I do not know whether that would be possible at future exhibitions.

3777. It is a very good suggestion; I do not think we have had it before. You had not any agent helping you, not one of the exhibitors' agents there?—No, we had our own man there; and I was over there myself for three weeks putting this up. I do not know what agent one could have employed that would have been of any use, but we certainly did not do so.

3778. Do you think that we should hold aloof from international exhibitions, from your experience in the past?—I do not think one can afford to do without advertising in any sort of business, and of course we look upon it at all events as a form of advertisement, and I do not suppose the nation can afford to ignore the use of advertisement any more than we private traders can.

3779. You think in a wider sense that the country ought to be efficiently represented?—That is what I am driving at.

3780. I rather gathered you do not attach much value to the award of prize medals?—No; that was a point we touched upon just now.

3781. Do you think they were fairly awarded?—I have no doubt they were, according to the lights of the people who awarded them; but it seemed to me that the only or the principal thing for which one was awarded a medal, and so forth, was for having spent so much money on the Exhibition.

3782. You thought they were awarded from the value of the exhibit?—From the value and the expense that the exhibitor had gone to generally.

3783. Not to the beauty of the exhibit entirely, you mean?—Not to the beauty, nor to any merit of workmanship there might have been. In that connection I have made one or two notes. I am of opinion that in the section of Applied Arts, at all events (I am

Mr. A. Heal.

7 Mar. 1907.

taking it that we may include furniture under that heading), it might not be practicable in all sections, but in this section I think there should be some Committee of Selection, a Hanging Committee, just as there is at any other selection of arts and crafts work, to preserve a certain standard of excellence of design and work. If a section of the exhibition is a national exhibition, surely some care should be taken to preserve the dignity of the nation in the representation of its work. Anybody who chooses to buy space, no matter what he is going to exhibit, should not be allowed to exhibit.

3784. Did you care much about the German exhibit?—No.

3785. You are aware that they had something of that kind?—I was not aware of it.

3786. Before the Exhibition they selected the exhibits; it was not all goods that were allowed to go there?—I am very glad to hear that was so.

3787. You think something of that sort should be done over here?—I feel most strongly about that.

3788. That some organisation, Government or otherwise, should make a selection?—Yes. Of course, as you know, in any exhibition of painting or sculpture, or anything of that sort, such a selection is exercised, and sometimes the thing is left open for people to send in, whoever likes, or it is a matter of invitation, and those people who are invited can exhibit; I do not know whether that would be practicable. In the Art Section I believe the only work which is accepted is that which is selected from the work sent in by specially invited artists. This perhaps would not work in the Applied Arts section, but some invitation or special inducement might be held out to bring in pre-eminently successful workers in each trade. I think one must admit that the International Exhibitions do not hold out much advantage to a small man who is really doing good work. He cannot afford, or possibly he does not care to spend money on an exhibit of that sort.

3789. That brings you rather to the idea of having a collective exhibit assisted by the Government?—Yes, that is rather what I was coming to; some invitation or some special inducement might be held out to any people whom it would be thought desirable to include in a national exhibit, and possibly those invited exhibits might be put in a separate section apart from the ordinary trade exhibits.

3790. You think in the work you are interested in you might have collective exhibits with great advantage?—I do certainly.

3791. To bring out what is really good and beautiful?—Yes.

3792. Did you see many things which you thought ought not to have been there in your section? Did you think there were a number of things that were inferior, you need not mention names?—Yes, I did.

3793. You saw things you were not proud of as being from this country?—Yes. We exhibited things ourselves which, if there had been any Committee of Selection, ought not to have been passed, I think. They were simply things of ordinary commerce, such as I could pick out of our shop in Tottenham Court Road any day of the week. That was apart from our particular exhibit, because somebody next door did not turn up or something of that sort, and we got some extra space allotted. It was offered to us and we took it and filled it with something, and that was really the most profitable part of the exhibition to us.

3794. You did it, but are not proud of it?—I was not myself. From a national point of view it did not do us any good, although from our particular point of view we made more sales from that part of the exhibit than from our exhibit proper.

3795. Altogether you were not proud of the British section, I am afraid?—I was not.

3796. Other exhibitions you have not seen much of?—No; I have only seen that in Glasgow.

3797. Glasgow was very small comparatively, but very good?—Yes. As I say, we have sent over things to St. Louis and also to the present exhibition which is going on in New Zealand now.

3798. You have sent to New Zealand?—As a member of the Arts and Crafts Exhibition Society.

3799. You have been sending nice things there?—Yes, we have sent only through the society; we have not touched that on our own responsibility.

3800. That is a sort of collective exhibition of arts and crafts?—Yes. Only invited people can exhibit; not every member of the society has a right to exhibit, but only those people who are specially invited by the committee.

3801. (*Mr. Waring.*) Your idea with regard to the arts and crafts and its cohesive form could only be applied, I take it, in the case of small firms, who could not afford to have, as you say, a large exhibit?—I do not know why it should only apply to small firms.

3802. Is not this a difficulty—the Arts and Crafts practically represents one form of art or one class of art?—Of course, one cannot blind oneself to the fact that is very narrow.

3803. It is in a school, it is a definite school?—Yes.

3804. Perhaps you could tell us how you could apply the same principle to something which must be very much more comprehensive in its form. I quite agree with you that in exhibits like the Arts and Crafts' it is much better in a cohesive form, definite and distinct by itself. I am not quite clear, and I should be glad if you could enlighten me as to how you think a selection committee could operate with the kind of goods a number of firms should exhibit. How do you think that would operate?—I think it must be left to the larger firms to make their own individual efforts, apart from this select exhibit. That is really the national exhibit, the thing which has the nation's approval and sanction as being the best work that the nation is turning out. After that is done, then your large firms shall be allowed to do what they like on their own account.

3805. I take it your views are practically that there are two classes of exhibits in this English section, wherever it may be; one is the national exhibit, which would be controlled practically by the Government?—Yes.

3806. And I take it your view is that the cost of it should be largely contributed to by the Government?—I should think so.

3807. You think also, in addition to that, there ought to be a representative exhibition by practically anyone that likes to put forward their goods?—Yes; I should like to see even that very much more controlled.

3808. That is the difficulty. I am in sympathy with you about the character of goods that should be exhibited, but when you bring it to the practical test of how to exercise control, it is an exceedingly difficult point?—Yes.

3809. I do not quite see how it can be done; I think perhaps you can assist us?—I have not thought the matter out to that extent. I threw it out as a suggestion as something that might be desirable; but whether it is really practicable or not I should be very glad to know.

3810. I take it you bring forward the Austrian Court as a case in point in the Paris Exhibition; I think both that and the German Court come under the same category. Was not the success of that court largely owing to the artistic control of the court and the manipulation of the design of the court itself?—Yes.

3811. Does not that emphasise the importance of arrangement as much as the exhibits in detail?—Certainly. I was not at all referring to the exhibits in detail, but merely to the general arrangement.

3812. Therefore, you are strongly of opinion that, from our standpoint, anything we do in the future should be controlled by some representative body who would bear that well in mind, and give much more consideration to the court than they have done in the past?—Yes.

3813. You are very strongly of that opinion?—Yes. I am glad you remind me about that, and correct me with regard to the individual exhibit, because that certainly was not the impression I wanted to give; it was the harmonious whole, with a certain background running round the whole thing.

3814. I think you are quite right in emphasising that point. It has a dramatic effect that tells largely upon the visitors to an exhibition, and that dramatic effect is very largely gained by the way the court itself is

handled?—That was, I take it, due to the nation, and not to the individual exhibitors.

3815. Were you struck with the German Court there?—Yes, I thought it was very good.

3816. There was the same sense of completion?—Yes.

3817. You were strongly impressed with the "incompletion," if one may use the word, that characterised the English Court?—That is so.

3818. You say, with regard to the general control, that so far as individual help could be given it was satisfactory?—It was extremely so. The amount of courtesy and patience with which one met was extraordinary; I could not help remarking that.

3819. Your point is that there was a lack of organisation, or there were not sufficient people to cope with the work they had to do?—That is rather what I should say.

3820. That, again, would come under the control of the powers who dominate the exhibition; it should have been better organised—that was your point?—Yes.

3821. And there should have been much more help?—A larger staff.

3822. There should have been much better scheduling of labour bureaus, and the assistants should have been a much better organised body?—I do not think there was anything in the form of a labour bureau.

3823. I do not think there was. That is your point as an exhibitor?—Yes.

3824. It would help you largely, and with such facilities as that you would be inclined to exhibit in the future?—I think so. The ordinary Englishman, who is a terribly helpless person when he is the other side of the Channel, is in a very great disadvantage where he has to get temporary labour. I know the man I sent over there was completely at sea. He could not speak much French, and that sort of thing, and I had to go over and extricate him, and I found it very difficult to do that.

3825. (*Mr. Malcolm Ramsay.*) You do not seem to have taken part in any international exhibition between 1867 and 1900?—That is so.

3826. Can you tell me why that was?—I am afraid I cannot.

3827. Did you, for instance, think of going to Brussels in 1897?—No.

3828. Or to Antwerp in 1894?—No. I know something about what was going on then, but we had not really any serious thoughts of doing that; in fact, I think my people had dropped the idea of international exhibitions altogether until I took the matter up myself in Paris. There was really nobody who was sufficiently interested in that sort of work to do it.

3829. I gathered from what you said to the Chairman that, so far as your own firm were concerned, you were a little disappointed with the results of the Paris Exhibition. Is that so?—I think it is almost impossible to trace direct results from any form of advertisement, and exhibiting at an exhibition of that sort is more difficult than any other form of advertising to trace results from.

3830. Are you inclined to continue the policy of occasionally exhibiting abroad in future?—I do not know that I am prepared to say one way or the other. After all, one must judge every exhibition on its own base, as to where the exhibition is, and so on.

3831. I suppose you would regard Paris as the most suitable place for a foreign international exhibition?—I suppose so; it is more get-at-able, and has more direct results.

3832. Do you consider that you got any benefit from the Government grant that was given for Paris in 1900?—No.

3833. Except the indirect assistance that the executive gave you?—From the Government grant?

3834. Yes; do you think that that helped your exhibit at all?—I do not remember how we were affected. How should we be affected by the Government grant directly?

3835. Do you think you had a better opportunity of showing your goods than you had at exhibitions which were privately organised—take Glasgow, for instance. You were not relieved of any direct expenses at Paris, were you?—No, the only expense of which we were relieved was the actual rent we paid for ground. I think we paid no ground rent there, and at Glasgow we did, I fancy.

3836. You were speaking just now about the organisation, and suggested some form of selection. Do you think that exhibitors generally would agree to submit their goods to a Selection Committee and stand by the result?—I am not making that suggestion as being the only form of exhibit which the nation is to make, but there should be some portion of the nation's exhibit which should be set aside as a selected exhibit.

3837. Is what you would suggest a combination of the selected and the individual?—Perhaps that is the easiest way to do it.

3838. I suppose the difficulty would be, would it not, that the larger firms might not like to submit their goods to a selection, and to have a similar article of equal quality, of a small man chosen, in preference of theirs, for exhibition?—I suppose that any person who submitted himself to a committee of that sort is open to that, but provided it is a good Selection Committee I do not think one need be frightened of that.

3839. The Selecting Committee, I take it, would not make its selection for the purpose of advertising the individual, but rather to get a collective and representative exhibit; they might take, for instance, a chair of one manufacturer and something else of another manufacturer, although their goods were equal in quality?—Yes.

3840. Would you, for your own part, be inclined to come into a collective exhibit of that kind, or would you prefer to exhibit independently?—I think we should probably do both, but I should certainly be very keen on getting something exhibited by that committee; I should feel that it was an honour, and the best form of exhibiting, apart from any other thing.

3841. Would you have any objection to telling us what your exhibit cost you, say, at Paris?—It has been put down at £1,000, but that is a rough figure.

3842. I thought that was the value; is that what it cost you to send it over and to keep it there?—The exhibit was not only the actual furniture, but the room and the decoration of the room. I have no figures here as to what the exhibition cost us; I could ascertain that.

3843. (*Mr. Harris.*) I think you stated to the Chairman that as a sort of offshoot from your main exhibit you took up certain things of "ordinary commerce," as you phrased it, and did rather well over that?—Yes.

3844. Do I rightly understand you that you rather deprecated having to do it at all?—No, I did not mind doing it; we were rather glad to do it; we did not have to do it; there was the space that was offered to us, and as we had originally applied for very much more space than we got, like everybody else, we rather seized upon the opportunity of having this extra space.

3845. I think you remarked it did no good from a national point of view?—That is so.

3846. But is it your view that the exhibition is to be looked at chiefly from a national point of view—I mean your own private view, or may I put it this way—would you say that an exhibition in your opinion has no relation to commerce?—No.

3847. You will not go so far as that?—No, but I can see two features of it, both of which might be borne in mind; I think there is the commercial aspect and the better or higher aspect of it. I think it should be the nation's effort to show the best work at an exhibition, and to feel that at all events it was well represented at the exhibition. I do not think that is so of most international exhibitions. Take stained glass for example. I do not think that really the best men who are working stained glass in England now exhibit at those exhibitions; you get certain firms exhibiting under their own name, but I do not think really that the best stained glass which England produces at present is represented at foreign exhibitions.

3848. Do you happen to remember what you exhibited which you described as things of "ordinary commerce"?—Perfectly well; it was a lot of plain, simple, decently-made oak bedroom furniture, but there was nothing about it that would excuse it being sent to an exhibition as an exhibit; you might just as well have seen it in Tottenham Court Road.

Mr. A. Heal.

7 Mar. 1907.

3849. From your point of view as a furniture manufacturer, an exhibition is really not the place to exhibit anything except that which is a work of art? Will you let me press you on that idea?—I think one should certainly keep that side of it more in view.

3850. You would say that the Government, then, should not be particularly concerned to push a matter that simply dealt with ordinary trade?—That is rather a wide view to take of it. I do not think my opinion will be very valuable on that.

3851. You think I am pushing you too far there?—I think that is rather too wide an application.

3852. Can you explain how you arrived at your idea that awards were given not according to merit, but—I forget exactly how you described it—according to the expenditure of the firm?—I did say that, certainly.

3853. Could you give your reasons for thinking that?—I saw several exhibits, or one or two small exhibits, had no award which I thought had equal interest and an equal amount to recommend them generally as those which had had awards given to them.

3854. Did those small exhibits belong to men with big names?—No, I should say they were for the most part people who were not so well known.

3855. Might it have been the name and not the expenditure that determined the award?—Possibly reputation would affect the committee; I have no doubt that would be so.

3856. (*Mr. Algernon Law.*) Can you tell me why your firm did not take part in the St. Louis Exhibition, although you took part at Paris, there being a Government grant and Government participation in each case?—I think we thought that there was not the slightest chance, or very little chance, of our getting trade with America, and there would not be any advantage from that point of view.

3857. You say that the staff at Paris for the answering of inquiries was limited, but they were very willing?—Yes.

3858. You did not hear of any complaints against the staff?—I heard of none at all.

3859. Was the attendance in the exhibition itself adequate, so that there could be some one to refer to in case of difficulty; was there one of the staff of the Commission about the exhibition the whole time?—No, the offices were outside the exhibition, as you no doubt are aware. I do not remember as to anybody being stationed in the exhibition. I certainly did not meet anybody.

3860. (*Mr. Wilson Fox.*) When you have shown at these exhibitions, have you shown mainly with the idea of getting an export connection abroad or of maintaining or increasing your reputation at home?—Our home trade.

3861. That is, of advertising your goods, so to speak, after you have succeeded in getting honours for your exhibit in a foreign country. The award is useful to you; is that your point?—No, I do not think the main object of exhibiting is to gain awards.

3862. You say that your object in showing, say, in Paris is to maintain or increase your reputation here?—Yes.

3863. How do people know in this country that you have done well or sent a good exhibit to Paris unless through the medium of an award?—There are a certain number of English people who visit Paris during an exhibition.

3864. A very small proportion of the general public?—I do not know about very small proportion.

3865. That is what I should like to get at; your chief object in sending to Paris would be that English people would see your exhibit there and come back here and purchase your goods?—Yes.

3866. And you think that it is worth your while to send for that reason?—We did think so; I cannot say that my experience leads me to say so now.

3867. That was the object with which you sent?—Yes, it was.

3868. Do you think that you are more likely to increase your connection here by people going over and seeing your exhibit than you are by gaining an award and advertising that fact publicly in this country?—I think so. I do not think I should be influenced by the fact that somebody had got a Grand Prix, or whatever it was, at a foreign international exhibition.

3869. You would think so?—Personally I should not be influenced by that; if I saw a good piece of work it could not be without its influence.

3870. Some firms do consider that these awards are of considerable value to them, do they not?—I have no doubt; I daresay so.

3871. One can only judge from what one sees; they advertise it so largely in their advertisements and upon their notepaper?—As I say, we used to do that; formerly we have made use of awards as a means of advertising in that way on notepaper, billheads, and so forth, but of late years we have dropped it.

3872. Assuming that exhibitions were well organised by Government, at what intervals would you care to send an exhibit abroad; how often would you care to take the trouble to get up an exhibit and send it to a foreign exhibition?—Once in ten years would be quite often enough for me.

3873. Often enough as regards the trouble you take and often enough as regards any benefit that might accrue to your business?—If there was any definite benefit, the oftener the better.

3874. That is your experience, that you would not care to send at intervals of less than ten years?—Yes.

3875. In looking round the British exhibit as a whole, as I have no doubt you did when you went with your own exhibit, could you express any opinion as to how the British commercial exhibits compared with the foreign commercial exhibits at the same exhibition?—What is a commercial exhibit?

3876. I mean machinery, textiles, clothing, furniture, anything which you consider a commercial commodity as distinguished from a purely art exhibit, like pictures, statuary or medals, or a War Office exhibit, or anything of that sort. What do you say as to that?—I do not think I formed any opinion upon that at all.

3877. You did not form any opinion whether the British exhibits as a whole were good, bad or indifferent as compared with the foreign?—I think it would be very difficult to get together in walking round an exhibition once or twice sufficient data to express an opinion upon that.

3878. Except that, broadly, you might have formed an opinion whether you were proud or ashamed of Great Britain?—I was not impressed certainly either one way or the other.

3879. (*Mr. Waring.*) What is your impression with regard to the last question asked you; suppose it was put this way: take our own Court, the Decorative and Furniture Court, and compare it with any other national court in the world, if you were asked as to the details of the work, the variety, comprehensiveness, character and quality of the work in detail, what would your reply have been from the English standpoint as compared with any other country in variety of design, in comprehensiveness of design, and in character and quality of the work?—Of course, one understands one's own work so much better than the work of other people.

3880. Your own work?—I mean speaking from a national point of view; I simply could not, for example, understand those pieces of furniture which were bought for South Kensington, because it is very difficult to understand and appreciate what the man was thinking about when those pieces of what were called L'Art Nouveau were being designed.

3881. I am afraid my question is not quite direct enough. The point one would like to get at is this: you might not be expected to know about any other Court than the Decorative and Furniture, but take the Decorative and Furniture, and throw your mind back on the comprehensive nature of the exhibits in detail and compare those with any other country in the world, what would your impression have been, that England was better in point of detail, in comprehensiveness of design and character, and quality of work than any other nation that you can remember?—What I was saying was rather a preface to my opinion. I was going on to say that in my opinion the English furniture was head and shoulders above anything else that I saw there, but one is so apt to be prejudiced in one's own favour. We understand our particular style that we are working in, and it is very difficult to try to put oneself in the place of the

Austrian who designs the sort of furniture that Austria is turning out at the present moment.

3882. Detaching any national preference one might have in mind upon the point of comprehensiveness of design, I do not think there is any question that the English court was supreme from that standpoint?—I think so too.

3883. The reason I put that so directly is this, to ask you whether under those circumstances the degenerative or uninteresting character of the English Court was not more owing to this lack of uniformity in the Court itself?—Yes.

3884. My mind is a little obscure on this point; you have evidently in your mind, in speaking of an exhibition, very largely the point of a high degree of excellence of design and a high degree of excellence of manufacture; that is the impression I have formed in hearing you; but we are living in a very democratic age to-day, and very few people can afford to pay for that very high degree of excellence, and the question is what practical value does it bear relative to the oak bedroom suite of which you are speaking (which I very much admired and which appeals to the masses), and the effect of educating outside countries in British art that they can understand and purchase; I ask you whether you do not think that there is some value in a view of that kind. There are rather two points; but the point I venture to put before you and would like to have your opinion upon, is whether a great deal of consideration must not be taken, in a democratic age like this, for the broad purchasing public which reflects itself to the national advantage by creating a taste for this kind of work in other countries besides England?—Certainly.

3885. (*Chairman.*) Do you agree with Mr. Waring?—Certainly; I think that would be more or less met by the suggestion of having a select national exhibit and a more general exhibit.

3886. I want to ask you a question rather in connection with the awards; you say they are worth less than formerly. Do you think that is because people rely more on their own judgment than they did 30 years ago; are they less uneducated in what is beautiful and what is ugly?—I do not know when international exhibitions were first inaugurated.

Mr. A. Heal.
7 Mar. 1907

3887. Take 1851?—I imagine at that time the thing was very much fresher, and these awards were looked upon rather as distinctions, and they had the merit of novelty if nothing else. One has got rather used to people with strings of gold medals on the top of their notepaper now, perhaps.

3888. Do your customers trust their own taste more than you have reason to believe that they did 40 years ago? Do you think that all this education has been of any use?—I do, certainly.

3889. In giving people the taste for what is good as opposed to what is bad?—I think certainly that the taste of the public generally has increased enormously, certainly within my time, the last 15 years.

3890. Would that decrease the value of medals; would people go on their own judgment, and not so much by the things which have got a medal?—I cannot give any opinion that would be worth having upon that.

3891. In your collective exhibit you would keep the names of all the different people who had made the things, would you not; you would have the names attached to identify them?—I think so.

3892. Did you think the British Pavilion at Paris was worth the large sum that was spent upon it?—I do not know what was spent upon it.

3893. Say £30,000?—I certainly thought it was very well done. I am always a great admirer of Mr. Lutyen's work, and I certainly thought it was admirably done. Whether from a commercial point of view it was worth the money spent upon it I have no means of judging. I think it was a great feature of the Exhibition, and everybody has spoken well of it.

3894. It was good for the reputation of the nation?—Yes.

3895. (*Mr. Algernon Law.*) It was a representation of Kingston House at Bradford-on-Avon?—Yes.

3896. (*Mr. Malcolm Ramsay.*) In deciding whether you would go to Paris in 1900 were you much influenced by the consideration that the Government would be officially represented?—Not at all.

3897. You would have gone in any case?—Yes.

Mr. Walter Birch, called and examined.

3898. (*Chairman.*) I think you have been in business some time?—Yes, 32 years.

3899. You have exhibited at great international exhibitions abroad?—Only at St. Louis.

3900. What did you exhibit there?—Upholstery and cabinet work, chairs and cabinets.

3901. Was your exhibit of the value of £4,000?—That was the value of our exhibit.

3902. Have you had any increase of business with foreign countries that you can attribute directly to the exhibition of your goods there?—We have increased our business with America and Canada about threefold since we went out there.

3903. Since the Exhibition?—Yes.

3904. On the contrary, have you suffered any disadvantages from your goods being copied or in any other way?—I cannot exactly say about that; all our goods have been copied, but I do not think to our disadvantage particularly. What I say is that at present I do not think the Americans are sufficiently well educated in the high-class workmanship to do us any material harm; their copies are somewhat crude at present.

3905. You send goods there to a large extent in spite of the tariff?—Yes, we are sending now between £15,000 and £20,000 worth a year.

3906. As regards awards, you secured the *grand prix* and a gold medal?—Yes.

3907. That you advertise, and it does you good?—Yes, we presume so. Our trade has increased since the Exhibition, but we cannot allocate it.

3908. But you think that had an effect?—In answer to that, we have had people, traders in America and Canada, who saw our show at St. Louis, come on purpose to see our show in London.

3909. Have you ever been induced to buy things from British or foreign manufacturers from having seen their goods at exhibitions, that would help you to any great extent, as the result of having exhibited there; it would probably be in the way of machinery?—We have improved our machinery considerably.

Mr. W. Birch.

3910. Was that from what you saw at St. Louis?—Partly at St. Louis and partly at other exhibitions where I have not shown.

3911. You have been to other exhibitions?—I have been to most of the exhibitions since the big exhibition in Paris.

3912. Why have you not exhibited at other exhibitions before?—We did not think it was worth our while. We started making some exhibits for the Paris Exhibition, but they were bought up by a firm that we thought would do better with them than we should do ourselves. That was the only reason we did not show there. I do not think we have contemplated any other exhibition.

3913. You did not show at Milan last year?—No; they are too close to England—we did not think it worth while.

3914. Too close to England?—We have our own representatives going through that district.

3915. You can advertise your goods in that way?—We keep a Continental traveller.

3916. Who goes with sketches, designs, and so forth?—Yes.

3917. Not the goods themselves?—Not models, only sketches and designs. We find that most of the big retailers on the Continent visit England, or London especially, once or twice every year, and they visit our showrooms then, or some of them.

3918. Are you in favour of this country exhibiting largely at international exhibitions, or do you think they might as well hold aloof?—I think it is quite time that England had an exhibition. I think we are a long way behind the times in not showing foreigners what we can do.

Mr. W. Birch.

7 Mar. 1907.

3919. You would like an exhibition here?—I certainly should.

3920. I was asking you whether you are in favour of a large exhibit of this country at a foreign exhibition?—Certainly not, I am not in favour of that at all. I believe in having an exhibition in our own country, an English International Exhibition, run under our own English auspices, and my reason for saying that is, I do not think the English exhibitor ever has fair play at these exhibitions when run under a foreign syndicate.

3921. Is that in the matter of awards, or in the allotment of space?—In the matter of awards, in the matter of space, and also the extraordinary amount of expense he is put to proportionate to the expense of those in the country where the exhibition is held.

3922. Do you mean he is charged more for space?—I think so.

3923. Was that so at St. Louis?—As far as space there was concerned we paid nothing for space; that was under the British Commission.

3924. What did you pay that the United States man paid less for, do you think?—We were held up in everything we had to pay for; it was the way we were treated there; it was something that an ordinary English trader could not realise. Everything was boycotted to a certain extent by the unions.

3925. That was in getting your things there and getting them staged?—No, we got our things there fairly well, but from the time that our cases were landed in the Exhibition grounds it was one continual large expense, big expense, unconsidered expense. I will give you one instance: After we had erected our booth we wanted it painted, and we had to have the union men, and the lowest rate of wage that the union had for painting was 4s. an hour to start with; and although we had the materials of our own there, and I could have done it myself as far as the painting was concerned, having nothing else to do, if I had wanted to do it, they would not allow us to touch a thing; and they held the threat of the union over our heads that unless it was done by union men they would take the whole of the workmen out of that particular building, which was the Varied Industries Building.

3926. They would withdraw all their workmen?—That is, the union people.

3927. Did you appeal to the British Commission?—I appealed as much as I possibly could. That is where I feel a little bit sore over that; although Colonel Watson might have been one of the nicest gentlemen that ever breathed, I do not think they took sufficient energetic interest in us exhibitors.

3928. Did you hear other complaints besides yours?—It was all complaints in the British section; I heard nothing else.

3929. And all very much on the same lines?—All on the same lines.

3930. Do you think other countries were better treated?—I think that the Americans were better treated. Putting it in my own way, the only men who were well treated, that is, as far as I can gather, were the Frenchmen (I will say the Frenchmen, because in one part of our building they were able to beat the unions) and the Japanese, and the reason the Japanese beat them was, I believe, that they took to a tin tack everything they required, and they built their own place inside without extraneous help with their own men that they took over there, and as to the Frenchmen, there was someone showing something in the engineering industry, and although they stopped their men for a time putting them up, the only reason that the union did not beat this particular French firm was because they could not understand millimetres and centimetres and the plans they had to work to, and they could not find a foreman who could.

3931. That would not interfere with the painting much, would it?—As far as the painting was concerned, they could tell me how to do that as well as I could tell them. They stopped me doing it myself, and compelled me to have the union men.

3932. What would have happened if you had done it yourself?—They might have caused a fuss and taken the men out as they threatened to. I did not think the game was worth the candle, so I simply did as they wanted, because I wanted to get my stand ready for opening.

3933. Had you a large expense connected with your exhibit there?—It put it down myself roughly that it cost me from £300 to £500 more than it might have done under decent circumstances; that is, only just the erection of my stand.

3934. Have you got the figure that your whole exhibit cost you from first to last?—Yes, the whole exhibition that we sent out at our own expense was £2,400. That was the cost of taking the stuff over and the expense of running it.

3935. What was the size of your stand?—I really cannot tell you from memory; it was a very large stand.

3936. Was it as big as this room?—Six times bigger. I had four fitted rooms the size of from here to the fireplace. I had a very large stand. I believe I had something like 120 feet frontage.

3937. The value that you have just mentioned did not include that of the goods you were exhibiting?—That is outside the goods, that is actual expenses; £4,000 was the value of the exhibit, and £2,500 was the expense in showing the exhibit and running it during the Exhibition.

3938. You consider that £500 could have been saved?—Could I have known as much at the first as I did when I had been there a month or six weeks I might have saved £200 of that expense myself. I am only giving you the St. Louis Exhibition, and how it was run. After I had been there a certain time I got to know that the ground upon which our stand was placed belonged to King Edward, that it was part of the United Kingdom for the time being; and the busybodies who came to put me to such trouble and expense had no right to come to me at all. I blamed the Commission a good deal for not enlightening me at the time about that.

3939. There was ground space of the Commission allotted to you?—Yes.

3940. They did not tell you to whom the space belonged?—No; I knew it was the British section, but I did not know the power that the British officials had over that section.

3941. Had they greater power over that than any other ground that was allotted to British exhibitors?—As soon as I found out it was a part of British territory for the time being, I took the law into my own hands as an Englishman, and when they wanted to put me right I told them to send for Colonel Watson, not taking notice of Mr. Yankee; that is how that came about.

3942. It was not in the position of an Ambassador's house in foreign territory?—We took it as part and parcel of our own, and after we had made our own position of it, and handled the matter in our own way, instead of going to the Commissioner, we got on very comfortably, and were not interfered with.

3943. Practically, you might have been worse treated, in fact?—I do not think I could have been worse treated.

3944. You very wisely took the matter into your own hands after a bit?—Yes. I will tell you one instance where the peculiarity of my position arose. In the first place, you must be somewhat practical to follow me. I had got 68 very large cases, and they allotted me a space; before I could unpack I had to erect my booth. There was a lot of trouble with the Customs, but we got over that. Before I could put my goods down I had to carpet my booth and put my fittings in. One of the unnecessary troubles they put me to was to find a place to put these cases. I could not unpack the cases and put them on the floor which I was going to cover with carpet, and I must put the goods somewhere. They put me to a lot of unnecessary trouble in removing those cases from place to place before I could unpack or put them anywhere, and as they were charging 4s. an hour for that, every time a case which weighed 15 cwt. or a ton was moved it was very expensive.

3945. Was 4s. the rate that you paid the skilled workmen?—I never saw a skilled workman there. That was for ordinary labour.

3946. Not for an ordinary labourer, surely?—Ordinary labour. I never saw there, even when they were repairing the few things we had broken, a labourer that I should care to employ in my factory.

3947. This was regulated by a union?—If he could

hold a saw and drive a nail he was a skilled mechanic there.

3948. Are there any other criticisms you have on the St. Louis Exhibition and your experiences there?—My great complaint of the St. Louis Exhibtiion was this, that our own Commission did not take sufficient interest in our exhibitors and help them out of the trouble they got into; my people got into some I have not spoken about.

3949. We have been told they were very willing indeed, but that there was not enough staff; is that your experience?—As far as the staff was concerned, I never met a better lot of gentlemen to do what they could, but you could not find the staff. I could always approach the American Commission or the people who were supposed to be there, such as the inside superintendent of the building, if I wanted to know anything; I could approach them much easier than I could get at our own people. Whether it was because they were overworked or not sufficient, I cannot say.

3950. They were at times absent?—No, I do not think that at all—not absent from the ground.

3951. They did not hide themselves, I suppose?—No, I do not think they did. It was a difficulty to find them, but I do not think they were in hiding.

3952. I suppose it comes to this: that there were not enough of them?—I do not think there was enough energetic supervision over them. That is my opinion, and I had the courage to say so at the time there. They let things slide for a week which might have been done the same day that you made inquiries about them.

3953. In thinking over your experiences there, have you ever thought of a better plan of working exhibitions than a Royal Commission?—I am not aware exactly of the plan that was carried out there, not the *modus operandi*. I think they ought to have some one allocated to a firm like ourselves, who have to go to the trouble and expense of erecting a booth; there ought to be someone that I could put my finger on that would assist me.

3954. One man you were sure of finding?—Yes, I believe Mr. Lloyd was the man I had to approach most, but Mr. Lloyd seemed to be wanted all over the place. There was about 1,200 acres of land, I think, and he seemed to be all over the place at once, or wanted to be, but we could never get him.

3955. Are not we coming back to this question that there was not enough staff?—That I cannot say. That was not my opinion. My honest opinion is that there was not sufficient energy put in for we people who were exhibiting; there was no one to answer my questions and help me out of the dilemmas I got into, as they could if they had taken the trouble to do so. If they say they were otherwise engaged, I cannot answer that question. I cannot say they were or were not. I know it took me a week to get an answer to a query which, as a business man, I think I ought to have had an answer to the same day. That is my answer to that.

3956. What I want to get for the future is rather your suggestions as to any different organisation, whether you are inclined to think you should have more business men in the management of these things?—My opinion would be, as far as refers to my own special exhibit or manufactures in the same line, that we should have a man allotted to us who should understand our requirements, that he should always be there until the shows were erected, at our disposal to help us.

3957. That is over a certain space of ground. I suppose you would not have a special staff, and tell off one for each exhibitor?—I will put it in this way, presuming there were twenty of us exhibiting at an exhibition, and we were in the furniture trade—I will keep to that, because I do not presume to know anything more—there will be sufficient work for one man to see our stands properly erected, because they put certain embargoes on our actions. We had to work so that it suited them; there ought to be a man told off, so that if you wanted to know anything about the erection of the stand, what is right and what is wrong, he would be the man you are to go to, and he would be the man to tell you, Yes or No; that is the man we never saw at St. Louis.

3958. St. Louis is the only exhibition you have experience of?—The only foreign exhibition. I have shown at exhibitions at home, trade exhibitions.

3959. There is also some evidence you would like to give as to your views about the selection of manufacturers for the different exhibits?—Yes. My idea is that if you are going to have exhibitors worthy of a national show, there should be a certain amount of discretion in the selection of their manufactures, and that they should be put in a certain space contiguous to each other, so that you can see the merits and demerits. I think it is easy enough to get that. There are experts in our trade that would tell you that—manufacturing cabinet makers and employers. I could mention twenty very nearly offhand that would be willing to exhibit.

Mr. W. Birch.

7 Mar. 1907.

3960. That would have to be done by the Commission or the superintending body?—By the superintending body.

3961. I think you say you would classify in the different sections?—Yes.

3962. As regards spending public money, you thought that the staff were not anyhow helpful to you, but you do not seem quite sure whether there was enough money spent on them or whether they ought to have been multiplied or not?—If the staff were overworked, they wanted more money spent on them than was spent at St. Louis; if that is the excuse that they could not give the attention required to the exhibition they wanted more staff.

3963. But money was returned from St. Louis?—I am rather surprised at that.

3964. What would you spend public money on if a grant were made?—If a grant were made, I think there are certain manufacturers whose exhibits are worthy of being shown that ought to be helped.

3965. You would help in the transport expenses?—Yes, give them an inducement to show.

3966. Would you have an examination here, or would you only go by the reputation of the firm? Would you invite such and such firms to exhibit?—Yes, if I were asked for my opinion on the matter, I should say that certain firms might be asked to show, some of the leading firms in the manufacturing industries, and there are some firms that are quite in a position to pay their own expenses; but there are other firms who really ought to show for the purpose of the exhibition which might be helped.

3967. How would you help some and not help others? Would you leave it to the man whether he would like to be helped and have a share of the public money?—I think if a proper committee was appointed to select those firms they would be able to arrange that.

3968. You think it would know which to help?—I think it would know who would require help, especially if you had the exhibitor before that committee.

3969. Have you any suggestion to make with regard to the arrangement of exhibits?—The manufacturers of furniture and cabinet makers that were showing in the St. Louis Exhibition were a long way apart. I believe the Varied Industries' building was 17 acres, as far as my memory serves me; the American exhibit was about 200 yards away from the English exhibit of the same class of goods, and the French exhibit was still further away. My idea of the arrangement of an exhibit would be that, if it was possible, the typical manufacturers should be arranged in a certain space where you could take them in, say an acre of that particular hall that you require for those exhibits, and they should be put as near together as possible.

3970. You take the view that you would like to see the exhibits of the same class of different countries near together?—Yes.

3971. You would not have the whole of the exhibits of a nation apart?—No, I would not.

3972. You believe in the ease of comparison?—Yes.

3973. Several witnesses have taken rather the other view?—You are asking me for my opinion; and, from a judging point of view, I do not think the judge has as good a chance to judge the different exhibits if he has to walk a quarter of a mile from one to the other; if he has them in easy range, and can carry them in his mind's eye, and go from one to the other, then it is much easier to give a more impartial judgment.

3974. Have you any views on the selection of judges?—Yes, I have big views. If we have an international exhibition in England, I am not comparing that with America, because I do not think the same thing would exist here as exists there. So far as we manufacturers are concerned, I think the judges ought to be the most eminent men that we have that have handled our stuff.

Mr. W. Birch.
7 Mar. 1907.

3975. The most eminent men you can get, but it is not everybody you can get?—Yes; for instance, take a firm like Maples; they are supposed to be the biggest firm in our trade; if you were going to judge manufactured articles that they buy, they certainly would have men who would be able to give judgment in a fair manner. Or take a firm like Warings; supposing you had a judge from Warings, presuming they are not showing, you are not necessarily obliged to have the head of one of these big firms; some of the men may have more practical knowledge than the employers.

3976. You want to have practical men qualified to judge in each section?—Yes, qualified men. I do not think a spectacle-maker, no matter what his reputation as a spectacle-maker, would be a fair judge of my furniture; whether I had an award or not, I should not think much of his judgment.

3977. Should you think at St. Louis there was much unfair judging?—From what we heard I do not think there was any merit in the judging at all, I am sorry to say.

3978. You do not object to their having given you the grand prix and the gold medal?—I do not think they had any alternative there; I think I was the only typical manufacturer present.

3979. There were only a certain limited number of grands prix?—I think very nearly everyone who exhibited had one. It does not place a lot of merit on it.

3980. (*Sir James Kitson.*) What is your manufacture?—Cabinets and upholstery ware.

3981. Chairs particularly?—Chairs, couches, and cabinets.

3982. When was your firm established?—About 1838, I think, say 70 years ago.

3983. Yours is an old firm?—A very old firm.

3984. As you have put it, I thought you were a new firm who found great advantage in going to exhibitions. You had great advantage from going to St. Louis?—Yes, that is the first big exhibition we went to.

3985. You had not been in the States before, had you?—We had not been long; about 10 years.

3986. You say you derived great advantage from going to other exhibitions and seeing the wood machinery?—Yes.

3987. And you have ordered wood machinery from exhibitions?—Yes.

3988. Clearly it would be a great advantage to those who exhibited the wood machinery that you and others should have the advantage of purchasing from them. Does not that apply to wood machinery more than to any other kind of machinery, because I think the developments in wood machinery have been very extensive of late years, have they not?—Yes, in the last 20 years.

3989. Therefore your point would apply to wood machinery where it would not apply to general machinery?—No, not to textile machinery.

3990. I am rather surprised to hear your complaints of the St. Louis Exhibition as to the cost of installation. I had some experience, and the business of my firm was done through an American agent, and it was done at a very moderate rate; the articles in iron and steel which were sent out were placed without any trouble, and there were no complaints of the Commissioners. Yours are very general complaints. We had not a complaint of the Commissioners, and the iron trade was properly represented there. You would be surprised to hear probably that every article exhibited was returned here duly and promptly, without a single article being missing?—No, I do not think I should. I have not a word to say about the transportation, nor the care they took of the goods after we had once got them erected.

3991. Would you be fair to admit that if you had had an American to look after the American work instead of an Englishman like yourself it might have been better done?—Possibly, but I think I know firms who had Americans looking after their work.

3992. You knew other firms who were in the same position as yourself?—Yes; I can go back to the Americans themselves; the Grand Rapid people themselves had the same complaint to make that I had. There was a syndicate formed to show for the Grand Rapid there. I cannot give you the actual facts, because I could not prove them, but I went to the Grand Rapid during the time the Exhibition was on; there was a syndicate, I think, of ten or twelve of the largest Grand Rapids in their booth, which was a booth they had put up 20,000 dollars or 25,000 dollars to build, but they had not got to the roof when all their money was spent.

3993. I suppose there were varied experiences?—I can only give you my actual experience; I cannot give you others.

3994. (*Mr. Waring.*) The Chairman was asking you a question with regard to your views of foreign exhibitions, and you said that you thought we ought to have an exhibition in England. I could not quite catch whether you are in favour of foreign international exhibitions, and whether, if there was another in three years, and you thought it of sufficient importance, you would go and exhibit there?—Certainly.

3995. You are in favour of foreign exhibitions?—Yes, I am.

3996. Apart from having one here?—Yes.

3997. You evidently feel very sore over the difficulties you had in getting information from the officials in control of the Exhibition. You cannot quite say whether in your judgment there were sufficient or not sufficient, but you seem to be quite clear that the organisation to answer your queries and inquiries was not good; in fact, it was very bad?—That is so.

3998. There was no organisation?—Apparently not.

3999. You were quite lost, and could not get information on any point, and you got so tired in looking for it that you went and dragged it out for yourself; that is the point?—That is the exact position.

4000. It also struck me from what you said that a particular point you complain of was the lack of commercial organisation?—That is so.

4001. I do not want to say this invidiously at all, but was it in your mind that there was the official control but not the commercial control?—There was more red tape than work; that is what I put it down to.

4002. If you had had good organised control and sources of getting information, you could have saved a considerable amount of money by the knowledge you could have got from that?—I could.

4003. Which you lost through having to drag it out yourself?—Yes.

4004. Would it have any influence on you in exhibiting in the future whether or not you were helped by the Government directly in the cost, say, in regard to shipping and freight?—Yes, that would have an influence. I do not think I should risk the same expense again from the firm's standpoint.

4005. That is another point. In future, if you were called upon, in spite of the advantages you got from St. Louis, you would not feel justified in spending such a large amount of money without assistance from the country?—Certainly.

4006. Therefore the presumption is that you would not go again?—Yes.

4007. In spite of the advantages you got, you say you would not face the position again without assistance?—I should not pay the same expenses again.

4008. A number of the witnesses have classified the advantages under two heads, one national and the other individual, the classification of national being that the nation gets a good advertisement of its wares in the foreign countries, and the individual gets a good advertisement for himself. Is that your view?—I am rather inclined to think it is more individual than national.

4009. Take this standpoint: Take the particular trade that you are engaged in. You go to America with certain designs of chairs and cabinets, and you strike a better-educated line than they have got in America; you therefore improve the public taste in America, and you prove the desire to get these particular designs that you have brought over; that is the national standpoint. Other people would get the advantage; they would reap where you have sown, because it infuses in the minds of the Americans a desire to have that particular style of furniture. So it has some national influence, I think you will say?—You ask me my individual opinion. I take your question to be whether it would have a bigger national or individual bearing.

4010. No; whether it would have both?—I think it would come to very much the same. I do not see how an individual can benefit without also benefiting the nation; you cannot part them.

4011. Have you any feeling with regard to Government helping in these matters in future?—My feeling is strongly that they ought to help from a national point, and not from an individual point, there, although the individual would have the help.

4012. With regard to the point the Chairman was questioning you upon with regard to the enhanced cost of labour, namely, 4s., that was not the usual charge. They simply rushed the people; on account of the exhibition they put up their charges?—The phrase was, they held us up; they had the power to hold us up.

4013. And you had to pay; there was nothing left for it?—Yes, we had to pay.

4014. (*Mr. Malcolm Ramsay.*) May I press you as to the extent to which you think Government might help the exhibitors financially. Do you think it is justifiable to ask the Government to help exhibitors in cases where they stand to increase their business and get considerable commercial advantage out of the exhibition?—I should have to answer that question under two heads. In the first place, I think that there are manufacturers that would be known in every trade that would require help before they could exhibit at all.

4015. The smaller people?—Yes.

4016. The people who are just growing?—Yes. They may have lots of merit, but not much capital. On the other hand, I think it should be proportionate help.

4017. Proportionate to the size?—Proportionate to the expense they are going to.

4018. It struck me that there is this difficulty: If you wish to subsidise the exhibitors, and relieve them of expense, either you will have to give a very large sum altogether, or else the help that you give will be too small to make any real difference to the exhibitor. Let me take, if I may, the figures you just quoted as regards your own experience at St. Louis. You said that you had spent something like £2,500, roughly?—Yes.

4019. If the Government was to give you material assistance, I suppose it would have to relieve you of, perhaps, £300 or £400 of expenditure?—My idea as to that would be help in getting your goods there and in the erection of your booths. Beyond that I think every exhibitor would stand on his own base.

4020. I thought you contemplated rather more. If it was a case of helping the exhibitor to the extent of £100, £200, or £300, then the total sum required might run into a couple of hundred thousand pounds?—The accountants brought it out that it cost us £2,500. I would presume, if ever we went to these exhibitions again, that I would bring that £2,500 down to, perhaps £1,800, or possibly £1,500; it would have been possible for me, had I had the experience, to have saved anywhere from £400 or £500 to £800 or £900.

4021. That would have been done entirely by an improved organisation?—No. It would have been done to some extent in that way, but it would have been done in this—that I would not depend on any foreigner again to render me any assistance at all. I would take my own men; I would make my booth, and erect it here, so that I knew it would go together; I would do all the work that was required at home, and only leave the fixing to be done there, and I would take my own men to do that.

4022. And doing that, you think the next time you could do it a good deal cheaper?—I am sure I could.

4023. What would really be just as useful to the exhibitor as a direct payment would be to have available tabulated experience that he could draw upon?—That would do a great deal.

4024. That would be just as useful, inasmuch as it means in saving money?—Yes.

4025. If that were done, you would not think it of importance to get a grant in aid, say, of transport?—It would be an equivalent to that.

4026. St. Louis is perhaps rather an exception in this way—that the distance is greater and the expense is much higher than it would be in the case of an exhibition, say, at Paris. Is not that so?—Much more.

4027. I should like to go back to a statement which I think you made, that you did not exhibit at Milan because you had a traveller going round Italy?—Quite right.

4028. Do I rightly infer from that that you think, as a rule, it is better to push your own business by travellers than by going to exhibitions which are fairly near?—In answer to that, if you will allow me to put it in this way, I do not think an exhibition would do us any good there, because we have already worked that district consistently for the last 10 years, and the people selling the class of goods we manufacture invariably come and see us once or twice a year in our own show-rooms in London.

4029. Would that same argument apply to France?—A great deal to France and to Germany and Austria.

4030. And, as far as your own experience goes, you care more for exhibitions in countries where you have no travellers?—Yes.

4031. Of the two, do you prefer to push your business by travellers or by going to exhibitions?—By travellers.

4032. You think you get more direct results?—Yes. One great reason why we showed at the St. Louis Exhibition was because we knew there was a market for our goods, but the ordinary American was bigoted about buying them; so we took them out to show the American public in order to induce the American retailers to buy the goods off us.

4033. Of course, you do not look upon the money you spent at St. Louis as wasted in any way?—We do not think it is wasted at all.

4034. You have spread the charge on it, apparently?—Yes; we have spread it over a term of years, and I think it has repaid us.

4035. In considering whether you would go to St. Louis, were you influenced by the consideration that the Government was going to participate officially?—It was through that consideration that I went.

4036. You think you would not have gone otherwise?—I should not have gone on my own account without the protection of the English Government.

4037. You value the official participation mainly because it means, or ought to mean, standing up for British exhibitors, and doing the arguing and official negotiations with the foreign Government?—It really meant seeing us righted and protecting us.

4038. You had someone to stand up for your rights?—Yes.

4039. (*Mr. Harris.*) Following up a point that Mr. Ramsay has taken, do you suggest that a good general organisation of the Commission at St. Louis would really have saved most of the trouble that you had with the labour, and so forth?—Yes, I do.

4040. Would you go on to suggest that there should be a permanent organisation to look after those things, so that when an exhibition is inaugurated in a foreign country that organisation should have everything ready for its intending exhibitors? Do you think that would help you?—You mean to say that a permanent body should exist to take advantage of any international exhibition that was going to be held, and do anything for the exhibitors that they are able to do with regard to their exhibits?

4041. Yes?—I think we should have expert advice then that we did not get over there in the States.

4042. That is what you are rather driving at?—That is what I am driving at.

4043. Have you exhibited in New Zealand?—No. We have representatives there, but I have never exhibited there.

4044. Have you refrained for the same reason as in the case of Milan—that you think you are covering the ground?—No; we do not think the country is ripe enough for our goods.

4045. (*Mr. Algernon Law.*) You said you did not exhibit at Paris because another firm had purchased your exhibit?—Yes.

4046. Did they exhibit your exhibit in Paris?—Yes, it was one of the retailers that we were interested in.

4047. Did they derive any advantage to their trade by having exhibited?—We have been doing fairly good business ever since through their house, and we have done a nice Parisian trade since.

Mr. W. Birch.

7 Mar. 1907.

4048. You think it was due to that?—As far as our firm was concerned it was quite new.

4049. Do you find an exhibition the best form of introducing a trade into a foreign country. Do you think it is better than beginning by travellers?—I can only speak of the one, and we think it has answered admirably as far as America is concerned.

4050. You would exhibit again in the United States if there was Government assistance?—Not under the same conditions as before; I should want an easier way of exhibiting.

4051. What sort of Commission do you suggest should be formed; at present a Royal Commission consists of a number of eminent personages, many of them not in any way connected with trade; I think you said that the Commission should be formed in a different way from what it is now?—I think there ought to be a few practical men on that Commission taken from different classes of manufacturers.

4052. Would that same observation apply to the staff?—I think we ought to have a more practical staff. If there was a big range of exhibitors in any particular class, whether in machinery, wood, leather, or chinaware and glass, there ought to be one member of the staff that was sufficiently practical to know the requirements that that exhibit would demand, to know how to cater for them.

4053. In these cases in which you had ground to complain of the neglect of the British officials, did you appeal to Col. Watson?—I appealed to Col. Watson very often—I think until he was sick of seeing me.

4054. But your complaints were not attended with good results?—I do not think Col. Watson had the power. I do not think a nicer man lives than Col. Watson; I think he would have done everything he possibly could to help us; but apparently he had not the power.

4055. In any case of flagrant neglect he might have dismissed the official?—I could not bring that home to anyone; I could not bring home any case of flagrant neglect.

4056. You spoke of the selection of typical manufacturers for different exhibits. How do you propose they should be selected, by the Commission?—By the Commission, presuming it is intended to be an international affair.

4057. Do you suggest the exhibits should be put together as a collective exhibit?—Yes.

4058. With the names or without the names?—Either. I think they should be in the names; the manufacturer, I presume, would put his own name on his goods if he was going to exhibit at all, or else you would show them under the auspices of the British Museum or something like that, the British collection, but it would not do the manufacturers much good.

4059. You found a good deal of cause of complaint of the jury, and you say that the best men should be selected. Of course, there would be a difficulty in inducing the best men to go out to an exhibition. What do you think of the abolition of all awards and letting everyone stand on their merits without the judgment of other people?—I really had not thought of that. I should rather be inclined to go with the abolition of awards, but I had not thought of it in my own mind.

4060. (*Mr. Wilson Fox.*) The reason which prompted you to show in America was, I understand, a special one?—Yes, because we thought it would give us business; we thought we should get business from it; it was purely a business reason.

4061. You did succeed, I understand, as far as you can ascertain, in getting business not only there but in Canada?—Yes.

4062. Had you before that time sent any travellers to Canada?—Yes.

4063. Your name was known in Canada?—Yes, and America.

4064. Therefore, as far as that exhibition was concerned, it was a success?—Yes.

4065. It has also been successful as regards your home trade, has it, on account of the award you got?—I think we have derived some benefit from it, although we cannot put our finger on the spot where it comes in.

4066. You say: "We secured the Grand Prix and Gold Medal which we advertise, and think it does us good in our business"?—I think so.

4067. You mean by that your business in England?—Yes, our general business.

4068. As regards the cost, I think you told Mr. Ramsay that you did not grudge that if you spread it over a term of years?—The cost was £2,400, and instead of coming out of the first year's trade, we spread it over four years, charging £600 per year. I honestly think that the trade from the exhibition has repaid that.

4069. Generally speaking, I do not want to bind you to a year or two, how often would you be prepared to put down money to show at an international exhibition? What is the interval between each exhibition that you would wish to elapse?—I should think at least three years.

4070. Would you be prepared to show as often as that?—I should be—that is, if the fashions in furniture change as often as they have been changing lately.

4071. Therefore it is the changing of fashion which would be your guide?—Yes, to a great extent.

4072. When you get a new thing to show you think that an international exhibition is a good opportunity?—If I may answer that in my own way, I put it in this sense: The main part of our business, when we get away from the main business for the million, of modern furniture, etc., is the reproduction of Old Masters; for instance, in America, as far as the general public was concerned, that particular part of the business was quite new to the man in the street, as we will call him, I believe, and we particularly wish to show some of those old specimens.

4073. Do you find you get many orders at the exhibition or do they drop in afterwards?—Very few at the exhibition. We were very fortunate in that exhibition, and we were especially fortunate to sell the whole of our stand. John Wannamaker, of New York and Philadelphia, bought the whole of it at one deal.

4074. (*Chairman.*) Was that one private purchaser?—One big retailer.

4075. (*Mr. Harris.*) At a profit to you?—Yes, at our price.

4076. (*Mr. Wilson Fox.*) As you have, I understand, a pretty complete system of travellers going about, not only in this Continent, but in America and Canada, you were able to judge, through the information which you gained from them, where it would be likely to pay you to show, and where not?—I think so.

4077. That puts you in a better position than persons who have no travellers, and have to take their chance at an exhibition?—I think so.

4078. (*Mr. Malcolm Ramsay.*) You spent £2,500 at St. Louis, and you said to Mr. Wilson Fox that you would be prepared under certain circumstances to exhibit every three years?—Yes, at not less than three years.

4079. Then the cost of each exhibition would be £800 a year?—I should never presume on these figures again, if you were asking me I should take at least £200 off those.

4080. Over what term would you spread that St. Louis money?—We have spread it over four years.

4081. It would be £600 a year?—Yes.

4082. Does that £600 a year bear a large proportion to the amount you spend on your travellers per year?—No, not a large proportion.

4083. It is not very much in comparison?—No.

4084. (*Mr. Harris.*) You referred, in an answer to Mr. Wilson Fox, to changes of fashion in connection with an exhibition every three years. Do you think the manufacturers themselves are to any extent responsible for changes of fashions?—That is one of the things I have never been able to locate. I do not know where they come from. I have seen many in my 32 years' actual experience in the trade. I started when the old-fashioned dining and drawing room suites were just going out of fashion, when the Early English period came in; how it came in I could not tell you. Then there was the Black and Gold period; it came in and lasted for a certain time. We never did know where it came from. After the Black and Gold came the Chippendale and the Sheraton. Then there was the Nouveau Riche, or some other such style; where they come from we are never able to get at. At the present time there is an old Queen Anne rage. Three years ago you might go through the whole of the West-End of London and you could hardly see a piece of

Queen Anne furniture, but in about three months' time everywhere there was lots of it; whether they dug it up or made it, or how they got it, I could not find out.

4085. But do you know whether there is a danger of manufacturers starting new fashions in order to go and exhibit them?—I do not think they can. I do not think they ever emanate from a manufacturer.

4086. (*Mr. Wilson Fox.*) When you exhibit do you send the very best and most expensive class of goods to appeal to buyers who would pay a large sum, or do you send the goods which will appeal to the ordinary person with a moderate income?—We send goods which we think will have the best commercial advantage to ourselves, stuff that the million can buy, as far as we are concerned; but both at home and at this particular Exhibition abroad we have always made something of the very, very best type we possibly could to show the people who are looking round our show that if they want better goods we are in a position to make them.

Mr. W. Birch.

7 Mar. 1907.

THIRTEENTH DAY.

Thursday, 14th March 1907.

PRESENT:

Sir Alfred E. Bateman, K.C.M.G. (*Chairman*).
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G
Mr. Malcolm Ramsay, C.B.
Mr. U. F. Wintour (*Secretary*).

Mr. Frederick Thomas Ford, called and examined.

4089. (*Chairman.*) I understand you are managing director of T. B. Ford, Limited, of Loudwater, Buckinghamshire?—Yes.

4090. Your speciality is, I think, blotting-paper?—Yes. My people were the original inventors of blotting-paper, which was produced in the old days by hand. They exhibited in 1855 at Paris, and got a medal, the highest award then for hand-made blotting-paper. We have been to several exhibitions since—namely, New Zealand in 1882, Adelaide in 1887, Melbourne in 1888-89, Paris in 1900, Chicago in 1893, and Cape Town in 1904.

4091. You did not exhibit in St. Louis, did you?—No, we did not go to that exhibition, unfortunately. I am rather sorry we did not go, because I think there was more notice taken of the St. Louis Exhibition by the British Government than of any of the other exhibitions. I went personally to the Paris Exhibition, but it is a very difficult thing for a manufacturer to go to New Zealand, for instance, or to Adelaide or Melbourne.

4092. Of course Paris is handy?—Yes. Then I did not go to Chicago or to Cape Town.

4093. I think the goods that you have exhibited have been entirely blotting-papers, in various thicknesses and colours?—Yes, and the raw materials from which blotting-paper is manufactured.

4094. Showing the various processes used by you in the manufacture?—Yes.

4095. Did you actually manufacture blotting-paper in any of the exhibitions?—No. The exhibit really consisted of bottles, which looked very much like bottles of chemicals. I am sorry I have not a photograph of it here to show you, but it was in a large case about as large as the tables in the middle of this room, but a little higher than the room. It was railed in. In the centre we had our hand-made samples, which were of some interest to the Americans, I think—so much so that they annexed them, and I have never yet had them back. They were supposed to go on to San Francisco for exhibition there. We had nobody to look after our interests at all beyond the agent we appointed. Mr. Saunders was my agent at the time, and apparently he did not want to go on so far as San Francisco; and they told me, when I asked for my exhibits to be returned, that they were in a museum in Philadelphia. I suppose they are, but whether they are or whether they are not I have never been able to ascertain to this day.

4096. Have you had any increase of business with foreign countries which you can directly attribute to the exhibition of your goods at these exhibitions?—The great question with regard to that is the question of Tariff Reform. In each case where we try to do business we find that the enormous duties, especially in the United States of America, are prohibitive. Our goods have obtained the highest award because of their excellent quality over the blotting-paper of other nations; for instance, we are far beyond the French and we are far beyond the Americans in the manufacture of blotting-paper, and we have applications from private people asking where they can get it.

Mr. F. T. Ford.

4097. I think you got more business with South Africa as a consequence of the Cape Town Exhibition?—In South Africa we are opening up a business.

4098. They do not manufacture blotting-paper there, I suppose?—No, they do not. Not only that, but you see there is not the same trouble in getting paper in there. They are mostly Englishmen, and there are agencies from the wholesale stationers here who know us, and therefore we are able to do a little by advertising, to back up the advertisement which we gained by the Exhibition at Cape Town. That was, I think, more or less, a private affair—that is to say, it was not an international exhibition, but it was got up rather by a private syndicate.

4099. What we want to get from you is more the effect of exhibitions as far as your business is concerned?—As far as exhibitions are concerned, there is no doubt about it, they enlighten everybody in every trade in which they are particularly interested, by enabling them to see the best and the latest things, especially in machinery.

4100. I am coming afterwards to what is the value of the knowledge that you have picked up yourself; but I want to know now what has been the effect of exhibitions as far as your business is concerned?—Do you mean the advantage to our firm in particular from our own exhibiting?

4101. Yes. You have told us that you have got an advantage in business in South Africa, but you have not mentioned any other place where you have got any advantage from exhibiting?—I should like to take them *seriatim*. In South Africa we are doing a larger business since we exhibited. In Chicago and in America generally we can do nothing; we are absolutely precluded on account of the tariff. In Paris we have opened an agency; but the advertisement to us from having a case and exhibiting our blotting-paper there was absolutely useless. It took me a day to find the case.

4102. At the Paris Exhibition of 1900?—It took me that much to find my own exhibit in Paris then.

4103. Did you go to the offices of the British section?—I went to my agent, Mr. Day.

4104. He would know all about the offices, of course?

Mr. F. T. Ford.
14 Mar. 1907.

—I took the catalogue first, and I said, "Now I will not go to the offices, but I will try to find this exhibit." Then I walked about to where I saw on the plans the paper-making part, the stationery, and so on. As you know, it was an enormous exhibition. I could find all the large countries like Russia, Germany, and Austria. Those all had large spaces of ground laid out and properly decorated, with the name of the country whose exhibits were there put up. In the case of Great Britain, we had no ground apportioned to us, we had no enclosure, we had no decorations, and, as a matter of fact, we had no subsidy, which the other countries had, I believe—in fact, no interest was taken in it.

4105. There was a lot of money spent there. Do you mean that you did not get a subsidy towards your space? Did you have to pay for your space?—As regards our space, we were dotted about in different places all over the Exhibition, and we had no special section marked "Great Britain."

4106. Who was next to you?—I think there was another English exhibitor in paper, and there were also a French manufacturer of blotting-paper and a Japanese manufacturer of blotting-paper there.

4107. Then you were amongst the papers?—Yes.

4108. But you would have liked to have been in a big national section?—I should have liked, when I walked into the Paris Exhibition, to have seen a huge board up with "Great Britain" on it, and I should have liked to have seen all the exhibits of British manufacturers placed in such a good position that they could not have been missed by the other nations of the world who came there to see that marvellous Exhibition.

4109. But surely anybody who took an interest in blotting-paper could see your blotting-paper, and could compare it with the other blotting-papers close by, to the advantage, I hope, of your blotting-paper?—Yes, I hope so; and, as we got a gold medal there, undoubtedly it would have been so. The point to me is this, that because of its obscure position it was lacking in the advertisement which I had hoped to get from it.

4110. Surely, for the comparison of your goods, it was an advantage to have similar goods near?—Certainly, and I do not object to that. That is another way of looking at it, of course; but, even then, it would be seen only by those people who wanted to get some notch from me as to how I made my particular goods, and it would not be an advertisement to me as a manufacturer of Great Britain. It would only be those people who were particularly interested in paper who would find it.

4111. But I suppose those would be likely customers for your blotting-paper?—No, I should think they would possibly be quite the opposite to customers.

4112. They would be your competitors?—They would be my competitors. That is a matter all exhibitors have to put up with. You always have the risk of informing your competitors of something or other which it is to their advantage possibly to copy; but that is not the object which a manufacturer has in going to an exhibition.

4113. Have you ever experienced any actual disadvantage from exhibiting at these exhibitions, in consequence of having your goods copied by foreign competitors, or in any other manner?—No, not that we are aware of. I am only speaking of what might take place with regard to it.

4114. You have not known it to take place in regard to your exhibits then?—No, we have not known it.

4115. Do you attach any considerable value as a means of developing your business to the awards which you have obtained at exhibitions; if so, for what reason? You have told us that you got a gold medal at Paris, and, I understand, you have opened a branch in Paris since?—We have opened a branch there.

4116. Do you think the gold medal helped in spreading the sale of your goods?—I think so. I think medals always, to a certain extent, show that the goods which have been exhibited are superior to other makes. When one takes a gold medal in competition with other nations it is a little more valuable perhaps than it would be if it was only given in one's own country.

4117. Very much so, I should think?—I look upon that as a certain help in selling the goods in that particular country, because the award is given by their own experts.

4118. Now, look at it from another point of view: Have you ever been induced to buy from British or foreign manufacturers to any considerable extent as a result of seeing their goods at any exhibition? If you have done so, that would be, of course, in connection with the materials and machinery which would assist you in your processes?—In regard to machinery, I recollect going to an agricultural show, which is tantamount to the same thing as an exhibition, and from what I saw there I bought a lift. Then I went to another exhibition, which was the Printing and Stationery Exhibition in the Agricultural Hall, and I remember seeing machinery which was particularly adapted to my manufacture. I had seen advertisements of it very often, but I had never seen the actual machinery until then. I bought that machinery owing to that exhibition. Those are only two cases in point, but I think when one can see the actual machinery—and sometimes at an exhibition you see it in motion—that gives you a better idea of what you are going to buy, and to what extent that machinery will be of advantage to you in your special business.

4119. Those were neither of them international exhibitions?—No, those were home exhibitions.

4120. And they were special exhibitions?—Yes; the one was an agricultural show and the other was a papermaker's show, or rather a special trade exhibition dealing with printing and stationery.

4121. But the principle is the same, of course?—Yes. We are naturally interested in machinery. I am always very glad when I find one of our engineers in this country is able to get foreign orders for his machinery, because so much of the machinery at the present day is made in America and in Germany, especially for papermaking. There is an enormous amount of it brought into this country which competes with our engineer here.

4122. Can you specify any definite point on which you have derived instruction or knowledge from visiting exhibitions—for instance, with regard to methods of manufacture, economy in manufacture, or opportunity to purchase improved machinery?—There is no doubt exhibitions do good. They bring people together, and an exhibition always opens the eyes of everyone who goes to it, and he sees something he has not seen before, and was not aware of possibly, or if he was aware of it it was by advertisement and he has not grasped the benefit that it would be to him in his own factory.

4123. Our next question is: If you have refrained from exhibiting your goods at great international exhibitions in the past or have discontinued exhibiting, what, briefly, were the reasons by which you were actuated? In regard to America you have told us about the cost, the distance and the prohibitive tariffs?—Yes. In the case of America we should only go there now to get an award and to show that we could beat everybody else in the world, because the Americans are making large quantities of paper and exporting it into this country from their country.

4124. Do their blotting-papers compete with you in this country much?—They send it over here.

4125. Do they?—Yes; but they do not hurt us at all, because we have got a speciality with regard to blotting-paper. They do not touch us in quality. They make a very big rough paper, which is used largely for advertising purposes, for insurance offices, and that sort of thing chiefly. We make a thick paper, but they are able to compete with us to a great extent in price, because they have no duty to pay in this country, and they get their raw material very cheaply, and their machinery is such that they can turn out an enormous quantity at a very low cost.

4126. Do you mean that they sell their goods here at a lower price than they do in America?—I should not be prepared to say that, although I believe it is a case of dumping.

4127. But you do not know?—I cannot give you chapter and verse for that, and I should not like to say anything I cannot substantiate.

4128. Therefore I will not press you on this point?—I believe that is the case, because when their mills are in full work over there, and they become a little short of orders for a time, they would rather keep their mills full running and send the stuff over here than they would reduce their quantity. Reduction of quantity means discharging hands, and if a man has got skilled hands and work is going short, he knows the output

of his mills will have to be reduced unless he sends his paper away, and he would rather send his paper away at cost price than reduce his output. That is practically what it comes to.

4129. Taking it rather for granted that you are not inclined to exhibit from a business point of view at such exhibitions as those in America, would you, with the object of ensuring that British manufactures were creditably represented amongst the exhibits of other countries, be willing to exhibit at great international exhibitions in future, provided that some permanent organisation were available which would minimise the trouble and cost to individual exhibitors—the object being rather the reputation of the country?—Yes, certainly. I think that every British manufacturer who has any speciality and anything that he knows would go well in a foreign country, would be glad to avail himself of an exhibition, and doubly so if his Government was willing to give some subsidy. I should like to say in regard to that, that we as a manufacturing nation are not represented so well, according to my experience, in large international exhibitions as other countries are. We are left more or less to our own resources and our agents.

4130. That is, you think, the organisation of these large international exhibitions is not so good as that of other countries?—No, it certainly is not.

4131. In what respect?—My particular experience with regard to the last Paris Exhibition was that our British goods were dumped about in various places some of them difficult to find—especially in my own case; and that the other nations had a subsidy from their Governments by which they were able to have a very fine show, a large space, and to identify themselves and their exhibits with their own country.

4132. But surely the arrangement of the British exhibits was not different from the arrangement of the exhibits of other countries, was it?—You see, if you go to an exhibition with a subsidy you have got money, and you can say, "We will have this space," which is a fine space, probably at the entrance of the exhibition, or "We will take that building; we will take the whole thing." The Government takes the building, and they label it with the national name, whatever it may be, and the exhibitors come in and take the space.

4133. Just tell me the process that you went through at Paris. How did you come to exhibit there at all? You were invited by circular from the British Commission, I suppose?—I think that was so originally, and that was followed up by a letter from an agent named Day. Now we have come to a point I should like to recommend this Committee to take note of, and that is to have as witnesses agents who have represented British manufacturers, because they would be far more important as witnesses than the manufacturers themselves. We have to be at home to look after our works, but these gentlemen go over there as our representatives, and they know all the difficulties that have to be contended with.

4134. We have had one or two of those gentlemen before us, but I am glad you have mentioned the point, and you are quite right to do so?—It is a most important point.

4135. What I want to get from you is what happened after you decided to exhibit in Paris. You got a letter from an agent, I understand?—We got a letter from Mr. Day, whom we know, and we appointed him our agent there.

4136. Then you entrusted him with the goods, did you?—We sent our goods over to the Paris Exhibition, and he had to see where they were to be placed. When I went to him, I said, "I did not come to you on purpose, but I thought I should like to see what sort of advertisement it would be to us, and I tell you it has taken me all day yesterday, and I did not find it. I could not find our case, so I have come to you now to ask you where it is." He told me where it was; it was not very far away from him. He had got several other agencies; I think they were chiefly for machinery, from what I remember at the time. He said, "You will find yours in the paper department." I said, "It appears to me that the other nations have their principal exhibits all in one building, and that Great Britain has hers divided up under the different manufactures. Then, of course, it was left for him to see the jurors, and to place before the jurors the particular qualities which we claimed for our paper, and we obtained a gold medal.

4137. That was all right, then?—Yes, that was satisfactory. That shows that as far as the award was concerned our goods did obtain the highest award; but as an advertisement to us it was very poor indeed, because the goods were seen by hardly anybody, and our exhibit was treated as an offshoot of the exhibition; in fact, it was placed in an out-corner of it, where no member of the public in the ordinary way of seeing the exhibition would go—it was shelved, in fact.

4138. Of course, you understand that your goods could not take up a great amount of space, and that it would be difficult to make a great show of the goods themselves as they would not catch the eye like an exhibit of machinery?—Quite so; but I think we ought to have had all the British goods in one building, with a label over it "Great Britain," like the other countries. Take Italy, for instance, in that building you found all kinds of things—machinery, guns, and everything else belonging to the country.

4139. You spoke just now of other countries' blotting-paper exhibits being placed next to yours?—Yes, that was so.

4140. In those instances they must have been arranged in the same way?—They were, undoubtedly. I was only saying with regard to international exhibitions, that, as far as the nation is concerned, we figure very poorly as compared with other nations. I think that was the point that I was speaking with regard to. As regards anything personal, and as regards my own particular manufacture, I have nothing to complain of, because I got all I went for—the highest award—which I expected I should get.

4141. But you would have liked to have had a more conspicuous place for your goods?—Exactly; I should have liked to have felt "I am a Britisher in a foreign country, and my country has as good an exhibit as other nations have."

4142. Did you ever go to the British pavilion, and did you ever talk to the British Commissioners or to their staff—Mr. Lloyd, or any gentleman of that kind at the Paris Exhibition?—No, I cannot say I did. I had no occasion to do that at all. My agent was representing me there, and I had no occasion really to approach any of the staff. I know the British Vice-Consul, Mr. Atlee, and I had the pleasure of some conversation with him sometime after the exhibition was over. I told him that I thought our Government was very lax with regard to exhibitions, and with regard to helping manufacturers in pushing their particular goods in foreign countries, as we had very little information supplied to us as to what was the particular kind of goods that we wanted in our particular line, whether, for instance, they wanted a particular size, or a particular weight or thickness or colour or anything of that kind; and that if a British manufacturer wanted to find it out the only way for him to do so was to employ his own agent.

4143. Are you alluding now to exhibitions or to the general trade?—I am referring to the general trade after the exhibition is over, and to our following it up. If we had had some good commercial committee to look after our interests there, or at any other exhibition, backed up by the British Consul or some other Government agent, I think that our interests would have been better looked after—I must say.

4144. That brings me to what I wanted to get from you: What do you suggest as an improvement on the organisation?—That is what I should propose—that we have a Commercial Committee.

4145. Whom would you get to start your Commercial Committee? Would you take it altogether out of the hands of the Government, and put it into the hands of a Chamber of Commerce—say, the London Chamber of Commerce?—I should think that would be a very good way of dealing with it, because a Chamber of Commerce, I take it, whether in London or elsewhere, would be composed of men who would be commercial men and who would have some idea of the value or otherwise of the exhibition, and who were the firms who should represent Great Britain at that exhibition, or who should be asked to represent Great Britain.

4146. I suppose you are aware that any amount of circulars were sent out by the Royal Commission to firms representing the different industries?—I believe that was so, and of course there were a great many of them who took advantage of that.

Mr. F. T. Ford.

14 Mar. 1907.

4147. But you think a Chamber of Commerce would manage the thing more satisfactorily?—Of course, that is a very difficult question to put to me. I am not up in the organisation of these matters, because they have been done generally by a Commission. If it is a Royal Commission, they have arranged matters generally by handing it over to a committee, and that committee has sent out circulars and so on, and the secretary has done most of the work. I do not think that we, as a nation, have troubled ourselves very much about exhibitions anywhere. It has been more that certain manufacturers have had certain goods which they have got awards for, which awards they have used, to a great extent, as an advertisement, because, of course, they like to get awards from the different countries where they are wanting to push their goods. I think, as regards the organisation, as I said just now, I should suggest that it should be handled first of all by commercial men, but backed up by a Royal Commission.

4148. Then you see you come back to the Royal Commission after all. You do not want to depend entirely on the Chamber of Commerce?—If the Chamber of Commerce could be empowered to engage the services of our British Consuls wherever these exhibitions may be held, I should say, "Yes; certainly that is quite sufficient," and a Royal Commission would be totally unnecessary in that case.

4149. The Commissioners are in touch with Consuls everywhere where there is an exhibition?—Do our Consuls do what they might for us at these exhibitions?

4150. Can you bring forward any instance where they have not?—I do not think they have been brought into touch with anybody at all who has had anything to do with it. I think it is more a case of simply this: There is going to be an exhibition, which is probably notified by the French Government to our Government, and then it is handed down until it comes to the manufacturers through circulars. Then the manufacturers say, "Yes, I should like to go," and an agent like Day or Sage communicates with us. I would recommend you, if I may, on this point to ask Frederick Sage and Co. to give you some information; they are manufacturers of show-cases.

4151. They are the great show-case people, are they not?—Yes.

4152. Are they agents of yours?—They have represented us, or, rather, they recommended Mr. Meadows, I think it was, to represent us, but they made our show-case. They take a great interest in exhibition work, and I think they might be able to give you some valuable information.

4153. Naturally, because they make the most valuable cases, do they not?—Yes, and they have a good deal to do with shipping them out; and they employ Messrs. J. Meadows and Co., I think, whom they recommended to us.

4154. Did you pay a lump sum to your agent, or did he send you bills for his services?—There is no rule to go by. In the case of South Africa——

4155. Cannot you give me Paris?—No, I had to go direct with the Parisians over the Paris Exhibition.

4156. Who paid the transport fees?—I paid my agent all our transport fees and everything. They admitted all goods duty free, and we paid in that case Mr. Day so much for attending to our exhibits during the time the exhibition was open, and then any expenses that he had were put before us, and we reimbursed him for them.

4157. Of course you are aware that the Government spent a very large sum, over £100,000, in Paris?—No; I was not aware of that.

4158. They have done that at these large exhibitions?—I must say that if they spent as large a sum as that, I should very much like to know where it was spent and how it was spent. I think it would be a very difficult thing to find it; £100,000 is a very large sum, and if such a large sum as that was handed over, I should like to know whom it was handed over to, and who really had the spending of it.

4159. If you had a catalogue you would see the names of the Commissioners there. Sir Herbert Jekyll, who was then Colonel Jekyll, was the Chairman of the British Commission?—I know his name very well.

4160. He was there for many months, and did all the work there?—As regards any money being spent by our Government on the show itself I must say that on my behalf I fail to see where it could have been spent.

4161. Did you do your own decoration, or was there none?—We had simply the case. Our case has a crimson carpet to it, and railings round, with silk cords and books, and that sort of thing. Of course, we had to pay everything in connection with the case, and I do not think there was any decoration. I have never heard that there was even anything paid towards the building which covered the cases in, let alone any decorations. I think we did not pay for space anyhow directly.

4162. Did you pay much for the handling of your goods—that is, for the services of the workmen who put your case into position, and that sort of thing?—That was done through our agent; that was included in his charges.

4163. So you do not know whether it was cheap or dear?—No.

4164. And do you know whether you paid the full railway rates for taking your goods to Paris?—I think there was some concession with regard to that, but I am not quite certain.

4165. Do you belong to the London Chamber of Commerce?—No, I do not.

4166. Have you no experience of Chambers of Commerce?—No; I have nothing whatever to do with them.

4167. I gather that what you really would suggest is that at an early stage the Commission should get in touch with and form a good commercial committee?—That is my idea in respect to an international exhibition. I think that we have neglected that point somewhat in our country. Other countries seem to have amalgamated throughout, or, rather, they seem to have grouped their exhibits.

4168. You mean that they have had what we call collective exhibits?—Yes. They have made it more a national exhibit. When you see a national exhibit, that makes a great impression on you. Take Russia, for instance. I do not know whether it would appeal to everybody else's mind as it does to mine, but it appeared to me that the Russians were showing things which in the ordinary way you would not see if they had not had them grouped together. For instance, there was their lovely jewellery and their beautiful enamels. If I wanted to buy any enamels now of that kind I would naturally say I should like to have Russian enamels. It has that effect on the public mind. When you go into a place and see these things you would connect them with Russia, but if anybody went into the paper department they would see something from Japan, they would see something from France, and they might see something from the United States, and they would see Ford's blotting-paper from Great Britain. You may say, "That is all paper, which is placed together." "Yes," I say, "but it does not connect the manufacture with Great Britain at all."

4169. I suppose there were very few British exhibitors in the paper and stationery department at that exhibition?—I could not tell you how many there were. They were so crowded together that there was hardly room to walk between the cases.

4170. But yet it made a very poor-looking exhibit?—Naturally, if you crowd an exhibit into a very small space it takes away the weight of it. If you have it in a large space with a beautiful roof over it and some decorations it adds to the beauty of the exhibit considerably.

4171. Would you have preferred to have been in a collective exhibit which had been properly housed and well decorated and better spaced?—And with the name of the country which I represented—yes.

4172. Was not the name of the country over you at all?—No, nothing of the sort.

4173. Nothing?—There was nothing to show I was a Britisher, except, of course, that there was my firm's name upon the case.

4174. (*Mr. Malcolm Ramsay.*) In considering whether you would go to any particular exhibition of which you have heard, have you been very much influenced by the consideration whether the Government would be officially represented at that exhibition or not?—No, I do not think so, providing the inquiries that I have made with regard to the exhibition have been satisfactory. I do not go to every exhibition. In

answering that question, I would refer you to the fact that I was exhibiting in South Africa. Thatwas an exhibition which I believe was got up just after the war, more or less by a private syndicate. I do not know that it was even acknowledged by the British Government.

4175. At any rate, we were not officially represented at it, I think?—No, we were not.

4176. So that really you consider an exhibition simply in itself?—Exactly. I look upon exhibitions very much as an advertisement for the opening up of new trade in new countries, in addition to showing an article which I am always convinced will take the highest award—a medal or a diploma of honour, or something of that kind, which is to every manufacturer some advantage—it is a proof, I mean, that the goods which he is advertising are better than anybody else's, or as good, or whatever the case may be, according to the award which he has obtained there.

4177. Supposing the British Government were to decide to withdraw from officially participating in international exhibitions, would you still go on exhibiting?—Yes, I think so.

4178. May I infer from those answers that you do not for your own part look for any direct financial aid from the Government in connection with exhibitions?—I do not know that we have ever had any, at least we have not had any that I am aware of. I was very much surprised to hear from the Chairman that £100,000 was allocated to the Paris Exhibition of 1900. This is the first I have heard of it, and if that was the case I should personally, speaking as an exhibitor, very much like to know where it went to.

4179. Did you get much result in the way of trade or advertisement from your participation in the Australian Exhibitions of 1887 and 1888?—We have done an increasing trade ever since we first exhibited there. I am not in a position to say whether that trade has been obtained through the exhibition, but I think that the exhibition was a good introduction to it. Having exhibited there, and having got two medals at Adelaide and Melbourne respectively, we went to some expense in advertising there, that is, in placing samples of our blotting-paper before likely users. We have got the principal Government contracts there at this day, and we are doing an increasing business there. Whether that is owing to the exhibitions, or more especially to the advertisement, I am unable to say; but I should rather think that the advertising has, as it were, spread it on after the introduction through the exhibition. I do not take it that because I exhibit paper, or my people do rather, in 1887, that that is going to make a business for me at once, because I do not think it would for a moment, but I think it opens up business—it introduces the paper.

4180. Might one put it in this way—that an exhibition is one form of advertisement, just as a direct advertisement in a newspaper is another?—Exactly.

4181. And both of them may be useful in a business?—Yes.

4182. Would you like to rely exclusively on employing your own travellers, and drop exhibitions altogether?—In that case you see there is no competition, and we should have nothing in foreign countries to show that our goods are better than anybody else's except we advertise them in a very large way. We should have to send samples to everybody, and let the people prove to themselves that they are better. I think they are more likely to believe they are good if you have exhibited in their own country, and have obtained from their own experts the highest awards. That is the way I have looked at it.

4183. Returning to the question of Government help, would you say that the organisation was the most important point?—Yes, most certainly.

4184. Would you attach more value to having a good organisation than to getting any formal subsidy?—To my mind it appears a national matter. If a nation is not well represented and the exhibits are placed about and are not grouped at all, you have an idea either that the nation is not exhibiting at all and they are going back in commercial prosperity as compared with other nations who are there and have got a very fine show; or, if you do find them about in different places, you think, "Well, they have gone back very much indeed; their Government has not even troubled to help them, or there is some other reason for it."

4185. Could you tell us whether you consider that bad organisation at any of the exhibitions to which you have been has cost you money and has increased your expenses?—That is rather a difficult question to answer, because if we had had an organisation, I take it, with regard to the money that was allotted at the Paris Exhibition, we should have probably enjoyed some of that money by having it expended on exhibits from Great Britain.

Mr. F. T. Ford. 14 Mar. 1907.

4186. I was not thinking of it quite in that form. I was thinking of it in this way—that bad organisation might, for instance, have caused your exhibit to go astray, and you might have had to spend money in that direction. We had a witness here the other day who said that if matters had been properly organised at a particular exhibition which he had attended, without receiving a penny of help from the Government, he would have saved £400 or £500, because he had difficulties with the railway labour, etc., etc.?—Was that at St. Louis?

4187. Yes?—That was a very different matter. There the labour question was a very difficult one, and I know some exhibitors who went there who had to take off their coats and put up their own show if they wanted it, and they were told to do it themselves. If anybody who was with them attempted to help them they had a very bad time of it—in fact, they were told that if they did not desist they would not help them, even if they came to the terms which they were standing out for. There was practically a strike amongst the Americans at the time. Therefore, I think, that is hardly applicable to exhibitions generally.

4188. Have you never come across any exhibitions in which you have had to spend more in consequence of bad organisation?—There is the case I was mentioning just now. That was in the time when Mr. Herbert Saunders was my agent, and we went to the Chicago Exhibition. I have mentioned to you that he wrote to us and said that he would like our exhibit to go on to San Francisco. I had a letter from him then in which he said, "We have received a letter from our Mr. Granville, in which he states that at the close of the Chicago Exhibition he sent your samples to San Francisco for exhibition there, and we think an award has been obtained"—we have never heard anything about that award to this day—"but this we can let you know within the next fortnight for certain." We never heard anything more about it. I wrote for my samples to be returned. They were very valuable samples, and some I could not possibly replace. They were samples of the old hand-made blotting-paper, which were exhibited in transparencies because they were so rare. They are things you very seldom see, and they are matters of interest to people in the trade, because it is all machine-made now. The letter goes on, "After this the samples were presented to the United States of America Columbia Government Exhibition as a permanent exhibit. The samples of blotting-paper we have here in our safe." They were sent in to Exhibition. The reason I quote that letter is because I think if we had had a proper organisation to look after our interests there, that would have been even better possibly, as they would have had some power in a way to deal with these matters and to obtain for us our samples, which apparently seem to have been lost.

4189. (*Chairman.*) That was in Chicago in 1893?—Yes.

4190. The British exhibit there was managed by a Royal Commission consisting of the Society of Arts' Council, as a fact, was it not?—I believe it was.

4191. (*Mr. Malcolm Ramsay.*) You were speaking just now of the value of awards; I gather that you think that the man in the street does still attach great importance to a firm getting an award?—I think so.

4192. Do you think that awards are as useful now as they were when exhibitions first started?—It depends, I think, very much on the exhibition. I think at international exhibitions where the awards are given by experts who are independent and who have no particular reason why they should give an award to any particular exhibit, that they are certainly as useful as they were.

4193. At all events they are still good as an advertisement?—I think they are, because the goods exhibited are always exhibited in comparison.

4194. And the awards really act as a certificate of quality?—Of quality as a rule.

4195. You think so?—That is the way I have looked

Mr. F. T. Ford.

14 Mar. 1907.

upon them, but of course I am unable to say whether they are as valuable now as they were in the old days. We have got them, as I say, right away from the commencement.

4196. You got an award in Paris; I think you said it was the *grand prix*?—The first award we got was at Paris in 1855. Are you referring to the Exhibition of 1900?

4197. I was thinking of the Exhibition of 1900?—We got a gold medal in Paris in 1900.

4198. With a firm of your standing there would be no question about that; but do you think that, leaving your own merits out of consideration, the system of awards really is a very satisfactory one, and that awards are given according to individual merits?—Yes; we have had reason to believe so.

4199. Some of the evidence we have had has rather been in the other direction, and that is why I asked you the question?—I think in some small exhibitions, perhaps, they are likely to gave awards where they wish to please the agents rather than for the merits of the article exhibited; but I think in large international exhibitions that is not the case. You see they have got no reason for doing it in the case of the large exhibitions. You cannot get at them, as it were, and there is no bribery and corruption; whereas in the case of a small exhibition there might be, perhaps.

4200. And the award might depend upon the energy of the agent?—Exactly so, or upon the money the agent had to spend in obtaining the highest award. That is not my experience, and that is only what I have heard. My firm has never, to my knowledge, had anything of that kind before them at all. Simply the goods are there, and the contract is made with the agent for expenses and so much remuneration for himself, and there is an end of it as far as we are concerned. I do not think Mr. Arthur Day would lend himself to any of those scurrilous sorts of arrangements.

4201. You will understand I do not wish to suggest that your firm adopted any other line?—I quite understand that it is not meant for a personal matter, but of course I am obliged to answer you from the personal point of view, because my experience in exhibitions has always been with regard to our own blotting-paper.

4202. (*Mr. Harris.*) Following up a reply you gave just now, did you have any conversation with others who were exhibitors of paper at Paris at the same time as you were, and did they express the same discontent that you have done with regard to being cramped in a small place?—No. The loudest complaint I heard with regard to that, except my own, was from my agent, Mr. Day. He was representing several British firms. He is an agent who is well known to most of the exhibitors, and he was a man who was loud about it. When he comes back, he will have a good deal to talk to you about on that point. I had no opportunity of communicating with any other paper manufacturers there at the time; in fact, I doubt very much whether they were there—I think they were represented by their agent. If they were there, they did not happen to be in the Exhibition at the time that I was.

4203. Do you think that all had an exhibition agent to represent them?—I think so. It would not pay the manufacturers, anyway, to go there themselves—they could not afford the time.

4204. If you had not had an agent, do you think it possible you might not have had an award? I want to push the inquiry as to the value of awards. Do you think that the jury could have found their way round and picked out your blotting-paper on its merits, if there had not been Mr. Day there to say, "You really must come and look at this"?—I should think that if they had a good pack of hounds and plenty of scent they might have found the case, and if they had found it probably—I have no doubt about it—they would have awarded the highest award; but whether they would have ever found it without some guide or not is a matter I am not able to say anything about.

4205. Supposing there had been a young manufacturer there who had not been up to the ropes, and had not had an agent, might he have been left, in spite of all his merits?—It is possible he might have been, except—there is just that chance—they might have come upon his case.

4206. But you are not clear about it?—I am not clear with regard to their organisation, as to whether they knew where these exhibits were placed or not. I suppose they did, because they put all the paper exhibits in one room, and therefore I should imagine that when they came to give the awards for paper they would naturally go to the paper and stationery department in the Exhibition.

4207. I suppose there is no question that it would have been part of their duty to go and see some of the paper exhibits?—I am absolutely certain it would have been.

4208. That brings us back to the question of organisation. Why do you say in your heads of evidence, "The Colonies are better looked after than the Mother Country"?—I should have put "other countries" as well as the Colonies, but it has been especially so with regard to the Colonies when we have had an exhibition in London. We have generally had a large building for each Colony; we have had the Australians showing their gold, their corn, their wool, and all that kind of thing, and we have had New Zealand showing her products. The Colonies have generally had large departments to themselves, in which they could show everything that the country produced.

4209. Then on this point you are rather thinking of what we have done over here?—Exactly.

4210. And not at Paris or at other places abroad?—I was thinking of our own exhibitions here.

4211. You mentioned the advantage in your opinion of having commercial men on the organisation; do you not think that that might lead up to jealousy as between one exhibitor and another? One commercial man, I suggest, might be looking at his interest, and another at his, and so a good many would be left out?—There is a great deal in what you say. I fancy that the French must have found the same difficulty that you allude to, because in the case of such men being on a jury, they had to withdraw their own goods from the competition for awards; they were not allowed to put in for awards, and that was stated on the catalogue and also on their cases of exhibits. With regard to the giving of awards, you must have somebody who is more or less an expert, I think, in each department. For instance, you would not put a paper manufacturer to award with regard to steel, perhaps, or on the best way to make steel.

4212. I certainly should not as a rule.—And you would not put an engineer probably to judge of blotting-paper, or writing-paper, or other kinds of paper.

4213. What I was thinking of rather was the arrangements leading up to an exhibition, as to which you were speaking in reply to the Chairman just now.—Do you mean in regard to the organisation?

4214. I mean with regard to the organisation which leads up to an exhibition; for instance, with regard to a collective exhibit?—I think that is really immaterial; a Chamber of Commerce can do that as well as any other.

4215. You do not think that the commercial men that you would introduce would be a more biassed bench of judges, do you?—I think it is a very debatable point in some cases; I am afraid so. I should think it is very much better for a Royal Commission to manage that kind of thing and to take their own experts for the awards.

4216. Do you now see what I want to bring out?—I think I must be with you there—I mean to say, if they were awarding in the same trade as the person they were giving the award to.

4217. (*Chairman.*) Then you rather come back to the Royal Commission for general management?—For general management, I think, yes, certainly.

4218. (*Mr. Wilson Fox.*) I regret very much that I was unable to hear the earlier part of your evidence. What is the main object you have had in view in showing at these exhibitions? Is it to get or maintain an export trade, or to do your home trade good here either by having English visitors see your exhibits at the exhibition, or by getting the award in order to help advertising your products here?—I think I should say that we exhibit for all of those reasons. One does not spend hundreds of pounds to go to an exhibition at a distance without expecting to reap some benefit from it.

4219. I rather wanted to find out which particular line was in your mind when you advertised at exhibitions?—The Chairman has mentioned those matters to me, and has elicited some replies which I think

will more or less answer that. I have stated that I look upon exhibitions as an advertisement, first of all, because they introduce the goods into the country that you wish to open up trade in.

4220. That is your export trade?—That is the export trade. Then if we get an award, which we always have done—the highest award—in competition with other countries all over the world, we look upon that as an advertisement too and as a valuable asset, because we can use that as a part of the advertisement that we circulate in other countries as well as in the country in which the exhibition is held. It is a sort of certificate that it is the best of its kind.

4221. So you hope to get good from showing at foreign exhibitions by reaping benefit both in the country in which you show, and also perhaps in other foreign countries, as well as in this country?—As well as at home. It is a proof that at that exhibition where other goods of a similar kind were exhibited, our particular goods got the highest award. That is what we go for, I mean, and I am glad to say we have been successful so far.

4222. Before you enter your exhibit in a foreign exhibition, I suppose you consider what chance you have of pushing your business in that foreign country?—Yes, and I think the question of the tariffs comes in.

4223. Would you consider the question of the tariffs before you show?—Certainly. We have not done so in the case of America hitherto, but I doubt very much whether we should find it worth our while to go there again. We got the highest award at Chicago, and we then tried to sell our goods in America, but we found the tariff was so prohibitive that although I have done everything I can to introduce the paper there, unfortunately we are unable to do any business.

4224. (*Chairman.*) What is the tariff, 50 per cent. or 40 per cent.?—It was 33⅓ per cent.

4225. (*Mr. Wilson Fox.*) Is the competition as keen there as it is in the home trade?—Do you mean to say do they compete with us over here?

4226. No, there—have they got successful manufactories of blotting-paper?—They have manufacturers over there, but our blotting-paper, as I was pointing out to the Chairman, is of rather a different kind.

4227. I see you showed in New Zealand in 1882?—Yes, we did.

4228. You have not shown in the recent New Zealand Exhibition, have you?—No. That is on this year. We have not gone out there again. Professor Julius Von Haast asked us to leave our exhibit exactly as it was in the 1882 exhibition, when they awarded us a gold medal, and we left it as a permanent exhibit in their museum at Christchurch. We thought it was not worth going out again as we had got the highest award we could get, and it was an expensive thing, and so we did not take it up.

4229. Do you find exhibiting at a foreign exhibition a very troublesome matter?—I have never had anything to do with getting up a foreign exhibition.

4230. I mean getting up your own particular exhibit?—No, because you see we have now arranged how we are going to show. We have been going to so many that it is all cut and dried, and if I had a notification now that there would be an exhibition anywhere, it is all ready to go off at a moment's notice.

4231. Your class of goods is not a particularly expensive one to get about with, is it?—It is so to us, because the case is bulky.

4232. But it is not brittle?—The bottles which contain the samples of pulp from which we manufacture the paper, and which also contain the colouring matter, are brittle. We had splendid testimonials from the Americans with regard to the colouring matter, which contains no china clay, but is absolutely pure, and yet our colours are well distributed. The papers are made from pure cotton stock, and have great absorbing powers. Those were matters that the Americans took up, and they had experts to judge of the samples we sent. That was their report, which we set great value upon. But as regards competition and trying to sell the goods, or getting anything in that way, of course it is out of the question and we cannot do it. They would rather have their own stuff than pay the enormous price they would have to pay for ours. The tariff is prohibitory.

4233. I think the general effect of your evidence, as far as I have heard it—and I am sorry that I did not hear it all—is that as a matter of business you consider that showing at international exhibitions is a good advertisement?—Yes, certainly; to have any chance it is essential.

4234. Apart from the tariff question?—I do not know. I think I should feel inclined to consider the tariff question in future, because I look upon an exhibition as an introduction of the goods, first of all, to the nation holding the exhibition. It draws attention to them. If I simply went for an award, I probably should not spend quite so much on it, yet I should go.

4235. You said the tariff in America is very high?—Yes, it is.

4236. Is it worth while, notwithstanding that, to show, say, at St. Louis, in order to introduce your goods to other foreigners who would visit the St. Louis Exhibition and who live in countries where the tariffs are not so high?—St. Louis is rather an outlandish place.

4237. It is; I am putting rather an extreme case?—If you say that there is to be an exhibition in Germany which the Americans are going to crowd over to, and to which all the States round Germany and the Scandinavians are coming, and everybody else, including the Russians—I should say certainly it is worth while to exhibit; but it is no good if you are going to treat exhibits as our exhibits were treated in the Paris Exhibition, because at Paris they did not get a proper chance amongst the people visiting the exhibition. They were only available for experts; they were in a corner, you see.

4238. I am assuming that you get fair conditions, of course. In reference to the point I put to you just now about America, I admit that it is an exceedingly expensive thing to show there; still, you have not only the chance that other foreigners will see your exhibit, but you have also got Canada next door; therefore do you think it would have been worth while sending to St. Louis as an advertisement?—In the case of Canada I should say most decidedly yes. We are doing business in Canada now. We have got better tariffs with the Canadians, and just within the last two or three years we are opening up business with the Canadians which we were never able to do before.

4239. Is it worth your while showing at a Canadian exhibition?—Yes.

4240. Would it be worth your while showing in America, on the chance of the Canadians going there?—I doubt that. I would not go to St. Louis because, as a matter of fact, we had enough of it at Chicago.

4241. (*Mr. Harris.*) Arising out of a question Mr. Wilson Fox has put, are we to understand that you consider your position in New Zealand so well consolidated that you can take any risks of a new firm coming in and getting the gold medal at the New Zealand Exhibition?—We did not look at it in that way quite. We had got our gold medal there, and we had got our permanent show there, and we are doing a certain amount of business with the Colony.

4242. And you have no fear as to your success?—No. Any way, we did not consider it. Supposing another firm had gone there and got the gold medal, we should have had to wait our turn for the next exhibition, when we should certainly go. My people invented it originally, and everybody else who has made it has got it more or less from our mills. It has gradually filtered through.

4243. Does the Englishman take it away with him?—He takes it all over the world through the workpeople; that is how it goes. When we do go to an exhibition we have never failed, in this particular article, to get the highest award, and we have generally competed with several of those people.

4244. (*Mr. Malcolm Ramsay.*) Would you tell us how much it has cost you to exhibit, from first to last, at any one of those exhibitions that you have been to? In other words, what does your advertisement cost you, if you do not mind telling us?—Shall I take Paris?

4245. (*Chairman.*) The Paris Exhibition of 1900 would be a good instance?—We had to have a case made for that, and I should think it cost us about £200.

4246. (*Mr. Malcolm Ramsay.*) Does that include taking the exhibit there, and bringing it back?—Yes.

4247. (*Chairman.*) And all your agent's charges?—It would be £200 to £250, and that would include Mr.

Mr. F. T. Ford. 14 Mar. 1907.

Day's fees and everything else. You see, our exhibit is not an expensive one. The next exhibition we went to, which I think was Cape Town, would not cost us so much—it might cost us just over £100—because we should not have to buy a case, though we should have to pay the freight, we should have to pay for the space, and we should have to pay agent's fees and lighting. Cape Town is a very dusty place to exhibit in. It is all sand, and that blows about all over the place, and so you have got to pay specially for cleaning and covering the exhibit.

4248. (*Mr. Malcolm Ramsay.*) How often would you be prepared to exhibit? Would you go every year, or every two years?—No; it would not pay. We have chosen those exhibitions I have mentioned, but other people, of course, go to a great many more. We have generally chosen big exhibitions, if possible, and we have tried to do business with the Colonies. If you will look at the list I sent in you will see that Paris was the original one; then we went to New Zealand, and then to Adelaide and Melbourne. Then we went to Chicago in the hope of doing business there, which we found an absolute impossibility; and then we went back to Paris again with a view of opening up an agency there, which I have done. Since then we have gone to Cape Town, and we have found more business arising from that. We have neglected New Zealand this year, because we have already got an award there, and the business is not so very great in New Zealand that it tempts one to go and try to open business there. If there had been a Canadian exhibition we certainly should have gone to it, and if there is going to be an international exhibition in London we shall certainly go to that; and with regard to any large place, such as Berlin or anything of that sort, I think it is quite possible we might go there.

4249. (*Mr. Wilson Fox.*) Have you volunteered to go to these exhibitions, or has someone on the executive of the Commission written and asked you whether you were prepared to exhibit?—We have had an intimation generally either from the Board of Trade or from the Royal Commission which has taken the matter up, and after that we have been approached by the agents, Messrs. Day, Sage, and Saunders. It is their business to see to it; they know that we are exhibitors, and they always apply to us, and get the agency if they can. There is generally a great competition to get the agency. They want to get as many agencies as they can to represent. That is the way it is done. It is a kind of private arrangement, more or less, and our Government do not seem to have taken the matter up at all with a view of having a national exhibit and showing the world that Great Britain is still the greatest manufacturing country in the world. They seem to neglect the idea that that is any good to us as a nation. My own opinion is that we ought not to neglect it, and that we ought to make as good a show at a large exhibition like Paris, or any other large exhibition, as other countries do. I do not think we ought to hide our light under a bushel.

4250. Might I just follow that up? You said, "any other large exhibition," I think?—Yes.

4251. That would depend upon how often these exhibitions were promoted abroad, would it not? What limit should you say should be put to the British Government acting in that way, and spending a very large sum of money in getting manufacturers in this country to come forward, as they would have to come forward, whether they wanted to exhibit or not, so that we might get a representative exhibit? There are two aspects. There is the financial aspect to the Government, which possibly may not be such a very important one, if there is a great stake at issue, and there is also the other aspect, that you will tire out the manufacturers and traders of this country by asking them to show too often. How often do you think that the British Government could successfully organise a large exhibit of British goods to send abroad, and what sort of intervals should there be?—It seems to me they are somewhat intermittent. Whenever these nations like to have a large exhibition I think we ought to be represented there, whether they happen to come two years together or ten years apart. They do not come very often, in fact. If you were going to make a regular thing of exhibiting at every little ambition, I think you would find you would not get manufacturers to go to it.

4252. As a commercial man, and knowing commercial men, do you think they would become reluctant to exhibit after a bit, if too great demands were made upon them?—Yes, I think they would, because it would be to many people much more costly than it has been to me.

Mr. Philip Baker, called and examined.

Mr. P. Baker.

4253. (*Chairman.*) Your firm is an important firm, making, I think, principally machinery for bread and biscuit baking, and so on?—Yes, that is so.

4254. Have you been long in business?—Yes; we have been in business for about forty years.

4255. I will just take you quickly through the answers to the questions you have been good enough to send up. You have exhibited at a good many international exhibitions, I think, including London in 1884, Amsterdam in 1886, Adelaide in 1887, Barcelona in 1888, Melbourne in 1888-1889, Paris in 1889, New Zealand in 1890, Chili in 1890-91, Tasmania in 1891-2, Kimberley in 1892, Chicago in 1893, Augusta in 1893, California in 1894, Paris in 1900, and St. Louis in 1904?—Yes.

4256. There are one or two in that list that I do not think I have heard of. The exhibition at Augusta in 1893 was not a large one, was it?—That was not a large one; it succeeded the Chicago Exhibition.

4257. Then there was the Californian Exhibition in the next year, and then you mention the Paris Exhibition of 1900, and the St. Louis of 1904; those are the two large modern ones?—Those are the two large ones. Then, of course, there was the Paris Exhibition of 1889.

4258. You exhibit chiefly biscuit machinery and ovens, bread-making and cake-making machinery and ovens, and chocolate and confectionery machinery?—Yes; those are the various things.

4259. Their value being about £3,000, I understand?—That would be about the average. In some of the larger exhibitions there would be considerably more than that. I was taking it rather as an average, bringing into the calculation some of the smaller ones, which would be £2,000 to £3,000.

4260. Have you had an increase of business with foreign countries which you can attribute to these exhibitions?—Undoubtedly.

4261. And you have not experienced any disadvantage in the way of imitation up to a certain extent?—I cannot say that we have. It is perhaps a guarded answer to say there has been some, it is difficult to trace any. The disadvantage has not been serious, certainly.

4262. I suppose there is competition in your particular line of machinery abroad?—Yes, there is competition.

4263. And at home, too?—Yes. In regard to copying, our competitors are almost the first to get information of new machines and so on, and they have other means of doing it besides going to an exhibition.

4264. They would not wait for an exhibition?—No, they would not do that at all.

4265. They would come over and buy a machine?—They would copy it from our advertisements or a copy of our catalogue. Machines are the easiest things in the world to get, because they are made to sell.

4266. Do you attach importance to the awards you have got at the exhibitions as a means of advertising?—We do. For one thing it gives one standing; people see at any rate what you have been doing, and to a certain extent it is an acknowledgement of merit.

4267. I suppose you have had a good many awards?—Yes, we have had a large number.

4268. Do you use them in your advertisements; do you put them in a case or show a photograph of them?—Not in that way, but we use them on our catalogues.

4269. On your catalogues and cards, too, I suppose?—Yes, and on all our papers we say that we have so many gold medals—35 or 36 gold medals, or whatever it is.

4270. Have you ever bought materials or machinery as the result of seeing what is being shown at exhibitions?—Yes, we have in some cases bought new machines for our works.

4271. Which you could not have bought so easily in any other way, because you could not have seen them so easily?—Probably they would not have come before our notice. It has not happened to any very great extent, but we have in several cases found machines exhibited that we have bought as the result of seeing them at an exhibition. Perhaps we would not have known of them otherwise. A case happened not long ago.

4272. What was the case?—It was a case of a special machine that we wanted. It was a polishing machine really, and it effected a big saving of labour. We saw it working.

4273. Where?—At the Machinery Exhibition here in London.

4274. Which exhibition was that?—The Engineering Exhibition at Earl's Court. That is the most recent case that comes to my mind. We saw the polishing machine working, and got facts and figures with regard to it, the result being that we bought one. Probably we should not have known of it, or would not have bought one if we had not seen the machine working in that way.

4275. With that machine do you effect some ecenomy in manufacture?—Yes, a very great economy.

4276. Where you have not exhibited at exhibitions, what are the reasons that have induced you to discontinue exhibiting?—One of the reasons is that we have been very busy at the time, and could not do it. But it would be more largely a question of the expense connected with the exhibition in question, and our thinking that for our purpose it would not pay very well to exhibit in that particular exhibition. Our policy has been to exhibit well or not at all, and exhibiting well means expense.

4277. I suppose it means a very large expense?—It means a large expense.

4278. Going to St. Louis must have been very expensive, must it not?—Yes, it ran into a lot of money; that was very expensive.

4279. There did you have any great trouble in having your machinery put up and in getting it unpacked?—We had very great difficulty. Everything was at sixes and sevens there, and the congestion on the railways was tremendous. The amount of difficulty in getting the stuff there and in position was very great.

4280. But when you got it into the exhibition had you any difficulty on account of labour being scarce?—Not specially, I think. We managed all right for labour there, I think.

4281. You did not pay an extraordinary price for labour?—I have not got the figures here, and I was not there myself superintending it at the opening of the exhibition, so I did not see it. We sent over two or three men from this side, and they took charge of the erecting, and I do not think they experienced much difficulty in getting help. I think they had not to pay much beyond the ordinary wages; we have not had to do so at other exhibitions.

4282. Were you at Paris in 1900?—Yes, I was at Paris.

4283. Can you give us your experience there?—We had not any difficulty there at all.

4284. I hope you got help from the Royal Commission, the superintendents and so on?—We did. We found the officials very courteous and obliging and very helpful.

4285. Helpful, do you say?—They helped us considerably in Paris, more than in some other exhibitions. It was well done there.

4286. And you got a proper site to show your machines?—Yes, we did. There was a difficulty with regard to the site. We erected a separate pavilion in Paris at the last exhibition. We made the pavilion in this country, and took it over. That meant a large expense. When we got there, there was some dispute with the authorities about the space, the position and so on, but the British officials came to the rescue in a very kindly manner, and they helped us considerably over that; they were a real help.

4287. They got over the difficulties for you?—They got over the difficulties for us then.

4288. You are speaking of Sir Herbert Jekyll and his staff?—Yes.

4289. Was it a large expense that you had at Paris?—Yes.

4290. You have not the figures here, have you?—I have not.

4291. Could you give it to us roughly?—What with the building and the plant we put in, and so on, it would be in the neighbourhood of thousands. We had another firm who shared with us— the firm of Olibet and Co., a well-known firm in France. They put up a pavilion, and we put up a large plant of biscuit machinery for them. Taking that in conjunction with our own pavilion and another exhibition that we had in the Machinery Hall it would run into £7,000 or £8,000, perhaps more, perhaps £8,000 or £10,000.

4292. (*Mr. Malcolm Ramsay.*) Do you mean that you were that much out of pocket?—No.

4293. Or that you spent that amount?—No. We had to put plant down to that value, and to spend money, and so on. There was a source of gain in this exhibition, because facilities were given for selling the products of the machinery.

4294. (*Chairman.*) At the time?—Yes; the machinery was working.

4295. Was it running every day?—The machinery was running all the day, and the goods were being produced and sold to the public. The income of that helped us considerably.

4296. Was it only produced for the exhibition? Were only the people in the exhibition eating your products, or were they on sale in Paris generally?—They were only for sale in the exhibition. That was to show the machinery at work in an attractive way, and to show what the machines would really do.

4297. It was a very good advertisement I should think?—It is the best way of advertising. Dead machinery is very uninteresting; if it is running and producing something it is an attraction at once to the public and also to your customers.

4298. Generally, your views of the organisation, as far as Paris is concerned, are rather favourable?—Yes, as far as concerns the last exhibition at Paris. In some exhibitions there has been a great difficulty in getting things done; there have been delays and lack of attention.

4299. Can you think of any recent exhibition in which you would like to criticise the management? There was Chicago in 1893; do you remember that?—Chicago and St. Louis were really much the same.

4300. Did you do a good business after Chicago in America?—A very good business indeed. It was a very satisfactory exhibition from every point of view.

4301. Have you ever thought over the subject generally, and can you say whether, speaking independently of your own goods and for the general purposes of exhibiting, an improvement might be made by having a more permanent organisation?—It would undoubtedly be an improvement, because the organisation of exhibitions is a business in itself, and inexperienced men cause any amount of trouble. Inexperienced men do not know how to go about the thing; they have to gain their experience, and they gain their experience at the expense of the exhibitors. In the case of Paris, I think most of the leading officials there were experienced exhibition men, if I remember rightly; at any rate, it is essential that men should have experience in exhibitions from one to another in order to enable them to oil the wheels properly, so that the thing should run smoothly. It has not been a question of the lack of disposition to help, but it has been rather the inexperience and the inability to organise everything properly and attend to the requirements of the exhibitors.

4302. You thought, I understand, that the people at Paris, who had had a good deal of experience, were satisfactory in helping you?—Yes. I think that probably accounted for it largely. At any rate, it is an axiom I think in exhibition work that only those who have been through the mill can help adequately, because there are so many details in connection with it which require attention. We have gained our experience, but of course we have had to pay for it in the first instance. We can exhibit now very much

Mr. P. Baker.

14 Mar. 1907.

more easily than we could at first, simply because we know the ropes, and how to go about it.

4303. You mean in packing your goods and sending them off, and in deciding whom to send with them?—Whom to send with them to look after them, how to arrange matters in the exhibition, and so on.

4304. On the general question, you think that this country should not hold aloof from exhibitions?—Decidedly so. I think we want to advertise as much as possible. I think it pays you to give prominence to the chief manufactures of the country. We have found it so in practical experience even in supplying specialties, but when it comes to the general merchandise that the world wants to buy, I should think it is essential to exhibit.

4305. I suppose it would be easier to exhibit specialties than to exhibit staples, which are much the same in every country? You would get more out of it by exhibiting specialties, would you not?—I do not know. I cannot speak for other people's experience, but I think that the nations who are spending money in exhibiting, and pushing their wares, get in that way a very fine return for it.

4306. You think that the nation, as a nation, should have a good and creditable exhibit at a big international exhibition?—I do think so. I think the Government should be asked to subscribe very largely towards a large international exhibition.

4307. Do you think, taking Paris, that the Government grant was not sufficient?—I do not think it was enough. It was not adequate. We could have had a better section than we did. It was better possibly at the last Paris Exhibition than it has been at some others; you have fixed upon one where we did it pretty well, I think.

4308. There was a large amount of money spent by the Government there—over £100,000, was there not?—Some of the others have not been backed up by the Government so well.

4309. What particular branches of expense do you think should be helped by the Government?—I think in the matter of decoration more should be spent on making the section more attractive. I think exhibitors who exhibit very largely and are spending a lot of money should have grants in the shape of facilities being given for getting their goods there free of charge for freight, and the same when returning.

4310. You got some reduction of freight, did you not?—In some cases. I think there was, if I remember rightly, in the St. Louis Exhibition, and I think there was in Chicago; but it has not been so in all exhibitions. I think more could be done in that direction, and that it would be a means of getting a larger number of good exhibits.

4311. Did you think that at these two recent exhibitions, St. Louis and Paris, Great Britain was satisfactorily represented as far as machinery was concerned—I do not take only your own machinery, but I am taking machinery generally as machinery?—No; I think not at all adequately. In St. Louis there should have been a great deal more machinery exhibited than was exhibited. I forget what proportion of space there was in the agricultural building in the British section; it was not a very large amount of space I know, and there was not a great deal left after our exhibit was taken out.

4312. How did you get such a proportion of the space for machinery?—It was in the agricultural part of the British section, and I am speaking of that particular part relating to food machinery; I am not speaking of the section relating to fabrics.

4313. In food machinery your firm had a great proportion of the space?—We had a large proportion. There ought to have been a larger display, I think.

4314. Are there many firms manufacturing your particular machinery here?—Not a very large number.

4315. Then you are almost the only possible exhibitors?—No. There were one or two others, but we had the principal exhibit. You will find an illustration of our exhibit in the St. Louis souvenir album.

4316. I have got it. You say in answer to our last question that there should also be less red tape in connection with the organisation and more practical help and support given to individual exhibitors. In what particular points has the red tape been too apparent?—The business was delegated from one to another, instead of there being one man who was thoroughly competent to be appealed to. Possibly an appeal is made to someone, and it is passed on to someone else, and then possibly to a third party, before anything is done. That necessitates delay and also divided responsibility, so that the unfortunate exhibitor has to suffer. In the case of exhibitions time is of very great importance, and in installing an exhibit everything has to be rushed at the last moment, and then, unless you get facilities for doing things and can appeal to somebody to have things done and to get permission, the delays will be very annoying and tantalising.

4317. Sometimes did you find a difficulty in getting at the right man?—We have found great difficulty in getting at the right man at once, and then possibly there would be two or three right men, as it were.

4318. (*Mr. Harris.*) You used the phrase just now "essential to exhibit." From what point of view do you consider it essential? Do you mean from the point of view of pushing your business?—Yes. Perhaps it was an unfortunate expression. You may do business without exhibiting, but exhibiting is a form of advertising that pays well, and it pays better than spending money in some other directions, because you have an exhibition open for six months and a permanent showroom to which your customers come from all parts of the world; your expenses are practically a known quantity and your business is an unknown quantity, but your customers are, as I say, coming from all parts of the world. You get at them readily, and by following up the inquiries that you get at the time of the exhibition good business will result. But it is necessary to follow up the business.

4319. Did you, as a matter of fact, find good results, say, in Adelaide in 1887 and Melbourne in 1889?—Melbourne, 1889, was a splendid exhibition for us, and it was for most of the British exhibitors. I was there personally at that Exhibition, and had an opportunity of judging the effects of it pretty well. It was at a time when business in Australia was very prosperous. Many of the firms as the result of that Exhibition established houses in Australia, and have been very successful since then.

4320. Have you any views as to whether business results are better from a Colonial exhibition or from an exhibition in a foreign country?—I think it largely depends on what you have to sell, in fact entirely so.

4321. Then you do not think a general rule can be laid down?—I do not see how a general rule could be laid down.

4322. One question suggests itself as a result of what you say. If business follows so well in many cases, do you think the Government is justified in giving grants to help that business along?—Yes, I do; because the more business that is secured, I think, the better it is for the country. I think it is legitimate to encourage exhibitors, because the expenses at the time are very great, and after all the business is problematical. If it is properly done, I think the business is pretty well assured, but the business will not be obtained at the time; it will be spread over some years after.

4323. Still, you think in the long run that the nation generally gets a return out of it?—I think so.

4324. You have referred also to doing good business at Chicago? What did you mean by that? Did you mean selling, as you did at Paris, the little things that you made, or did you mean that real permanent business was done?—I meant permanent business was done. The name was advertised, so that throughout the States our name became very much better known than it was beforehand. Manufacturers that we wanted to get in touch with came to us from all parts of the States, and we have had business from time to time during the years since, which has undoubtedly been the result of our establishing ourselves more permanently through the Exhibition.

4325. You mean you can trace it back to that?—We can trace it back, and we can also trace other orders that have been sent from other parts of the world as the result of that—even from as far off as Japan.

4326. Do I understand you to think that the organisation of exhibitions can be improved by having as a permanent nucleus a committee, or something of that sort?—Yes. I think that is one of the most practical ways of doing it, because the men who are appointed to it will have adequate experience. I think the best way of doing it is to have a committee, a nucleus at any rate, of experts

who have had experience in other exhibitions, and so on. It would help matters very much, I think.

4327. Then I understand you to say that on the whole exhibitions are good things for trade, and therefore we had better introduce some organisation which will keep the best apparatus ready at hand for use at any exhibition?—That is my personal conclusion.

4328. (*Mr. Malcolm Ramsay.*) I see you have exhibited very impartially at two classes of exhibitions—first, exhibitions which our Government has taken part in officially, and for which grants of public money have been made; and, second, the rest, in which we did not participate officially. For instance, I see you came to London in 1884; that was not an official British exhibition, was it?—No, that was the Health Exhibition.

4329. Then you went to Paris is 1889, but our Government abstained from that; and then you went to Chili in 1890, and then to Tasmania, Kimberley, and California; so that as a matter of fact in the past you have not been debarred from exhibiting by the fact that at certain exhibitions no Government assistance was given?—That is so. But the scope of the exhibits has to a certain extent been governed by it. In the case of Chicago, where we had a grant made for freight and where facilities were granted for cheap freight, getting goods over, and so on, we were able to exhibit more largely than in some of the other cases.

4330. So that, while the presence or absence of a Government grant may not have turned the scale in deciding whether you would go or not, it has as a matter of fact affected the class of your exhibit?—Decidedly.

4331. Do you think that your business has not got rather an advantage over other kinds of machinery manufacturers for the purposes of exhibition?—It has over some.

4332. You are able to show live machinery and turn out rather attractive cakes, and you draw a crowd of inquisitive people, and a great number of people who are on business, as well as the hungry people. You have been a very good draw, have you not, at exhibitions?—Undoubtedly that is so.

4333. So perhaps you are in a better position than some of the exhibitors?—That is only one side of it, and it does not mean as much as at first sight it seems to, because the general public are rather a bother. The object of the exhibit is to interest buyers of machinery, and the public being there are rather a distracting element. If our machinery, for instance, happened to be for making, say, cotton goods, or an exhibit like Messrs. Mather and Platt might exhibit, and the exhibited machinery could be shown at work, it would be intensely interesting both to the public and to the buyers; but my contention is that live machinery practically at work is a great attraction, and should be gone in for more by exhibitors.

4334. That is the point I want to bring out. Live machinery is more attractive than dead machinery at an exhibition, is it not?—Very much.

4335. Live machinery would also have a much better chance of being favourably inspected than, say, a steam navvy which could not be shown working?—Yes, and that should be encouraged, unquestionably.

4336. You suggested that the Government ought to do more in the way of subsidising exhibits—I forget your exact expression, but I think that was the tenour of your observation?—Yes.

4337. Do you suggest by that that they ought to give direct financial help to exhibitors?—No, not exactly. I think it can be done in an indirect way, which would perhaps meet the case, by bearing certain expenses in connection with decorations.

4338. Certain expenses of a general kind, you mean?—Yes. It would make the exhibitions more attractive. Then there are ways of helping and giving free power sometimes where they make charges; or they could make the charges for space rather lighter.

4339. Would you justify that on the ground of the national aspect of the question?—I would.

4340. As an exhibitor, being a large firm and doing a large business, would you expect the Government to help you to bear the direct cost?—No, not directly, but I want to make the charges all round considerably lighter.

4341. It seems to me that if you press the Government too hard for help in the way of money, you will get into this dilemma—either you will pile up the bill so enormously as to make financial assistance to exhibitors out of the question, or else the relief which every individual exhibitor gets will be so small as to be not worth considering. You said that you put down £6,000 or £7,000 to go to Paris in 1900; any direct help the Government could give you in the way of money would be a small sum in proportion to that outlay, would it not?—It would, but in mentioning that amount I do not want you to think that it is out of pocket altogether. The relief that we would get in cheaper space, and in freight, and in bearing some of the expense for decoration, and so on, would be a considerable amount really in an exhibit of that size. If you take it *pro rata* over all the other exhibits in the section, it would be a considerable figure on the total amount.

Mr. P. Baker.
14 Mar. 1907.

4342. Would you like the weight of the Government to be put on the railway companies to get reduced freights, and perhaps to get some organisation for the supply of cheap labour?—Yes.

4343. To enable you to handle your goods you would like the Government help to be in those directions?—That would be a decided help. I had not in my mind what one of the other questioners evidently had in his mind—and you have come to it again now—namely, the question of labour. If facilities could be given for getting cheaper labour at the time it would be a help. It is in the direction of making it easier to exhibit, and making it better worth while to have a good exhibit, that I think the Government could help.

4344. Do you happen to have heard that the Commission for Paris in 1900, still more perhaps the Commission for St. Louis in 1904, had considerable difficulty in getting manufacturers to come forward and make a representative show?—They had, I think.

4345. That is within your experience?—Yes, it is. Some considerable encouragement had to be given I know.

4346. Do you think that with improved organisation on the part of the Government, manufacturers—I am not speaking of your firm, I am speaking of other firms who hung back—would be more inclined to come forward?—I think they would, decidedly. I do not see why they should not be more ready to come forward, as some of the other exhibitors have in other nations, where they have been more helped by the Government. There has been great competition for space at Milan. We have not exhibited at Milan this time, but I know that there has been very considerable competition for space there, and if I remember rightly, considerable grants have been given.

4347. You spoke of some difficulty in St. Louis, of the railways being congested, and of a good deal of trouble in getting your exhibit erected. Were you thinking there of faults on the part of the exhibition authority, or on the part of the United States people, or on the part of our own Commission?—On the part of the United States people there.

4348. (*Mr. Wilson Fox.*) Have you been to most of these exhibitions yourself?—I have been to the majority of them.

4349. Quite apart from your own exhibit, I suppose you looked round the exhibitions you have been to?—Yes.

4350. Could you say generally whether you think that the British exhibits compared favourably with the foreign exhibits, or otherwise?—Generally speaking, they have not compared favourably.

4351. That is your general impression?—That is my general impression.

4352. Is that because we send fewer classes of goods? Was it on account of the quantity sent or on account of the quality, do you think, that the comparison was invidious?—The comparison was invidious in point of quantity, not quality. The quality has usually, I think, been very good.

4353. But a smaller number have exhibited?—Yes.

4354. Is it your view?—I think it is from what I have gathered—that the British exhibitors who did not show should be induced by the Government to show by being provided with the money either directly or indirectly?—I think more of them would respond if they had these facilities.

4355. Therefore it is rather the people who do not think it worth while to advertise who would in the end

Mr. P. Baker. 14 Mar. 1907.

have to be subsidised by the Government?—No. Speaking of it as a subsidy, I think it would apply to all exhibitors—those who are at present in the habit of exhibiting, as well as those who are not. But it would act in this way—that a large number of manufacturers who do not exhibit at present would exhibit, and those who do exhibit would probably exhibit better.

4356. But still, looking at it from the Government point of view, we may assume as a business proposition that it pays the people to exhibit who at present do exhibit?—Yes.

4357. If the Government find money to subsidise the rest, you are really finding money to advertise people who do not think it pays them from a business point of view to advertise in that particular form?—Exhibitors who make a very good exhibit sometimes will stop for some years and not exhibit again. They spend a lot of money over that exhibition possibly, and have found it an expensive luxury rather. Then another exhibition comes along, and they will say, "No, we had enough of it last time; we will wait awhile." It does not at all follow that because a firm has exhibited once they are going to exhibit again. It is an expensive business altogether.

4358. I will put another case to you, if I may. We are told by certain manufacturers that they send exhibits to foreign exhibitions, but in their particular trade there is no new invention or no new fashion or anything else done for ten years, and so they think that ten years is quite often enough for them to exhibit. In that case, supposing there was an international exhibition in an immediate five years should the Government, in order to get them to exhibit, although they do not want to exhibit, subsidise them to exhibit?—I think in a case like that, if there were a subsidy the firm in question would make a better exhibit, and would be induced to do so, where sometimes they would hesitate and possibly not exhibit.

4359. But still that would have to be done with Government money?—In speaking of the subsidy, I want it to be understood that I would not favour the direct grants of money to exhibitors. I do not think that is a use of Government money that would be justified.

4360. But still, in one form or another, if the Government finds, say, £200,000, whether they give cheques direct, or whether they give it in consideration of railway rates, or whether they give it for space, it comes to much the same thing as far as the Government is concerned?—Yes, it does.

4361. Take one other trade, a trade like the textile trade, who do not want to exhibit much. That is a sort of trade that does not greatly care to exhibit. Merchants buy the goods from the manufacturer, and so the manufacturer does not want to exhibit. If the Government want to get those goods shown at large exhibitions, they have to do one of two things, have they not? They have either to appeal to the patriotism of those men to show—and you can appeal too often to patriotism, perhaps, in business—or they have to pay for it?—Yes.

4362. Whereas with the machinery man, who is advertising machinery, it is the breath of his life to show?—Yes.

4363. Could you treat them on the same basis, therefore? One man it pays to show, and the other man it does not pay to show at all in his particular business. You see there are difficulties?—There are difficulties, and I see the difficulties distinctly that you mention. Each trade has to be considered on its merits in dealing with the question. I do not see how you can have altogether a sliding scale applied by a permanent body such as the exhibition officials.

4364. My point broadly is that if the Government wish to get up a big British exhibit for a large international exhibition, and have to find the money, they are on the one hand finding money for certain trades who do not want it, because it pays them well to expend the money themselves, and, on the other hand, they are finding the money to induce people to show who do not want to advertise in that particular form. That is the suggestion I want to put before you?—It is a real difficulty.

4365. (*Chairman.*) I suppose there would be gradua tions between those two classes, and there would be certain people that would show if they got a little help in the way of transport facilities and in the way of decoration?—Yes. I think that would meet the case. I do not think firms would expect to get anything in the way of a large grant, but they would expect to have facilities given, such as other nations are, at least, getting, and that Great Britain should be prepared to back up her manufactures or industries in the same way that other nations are backing up theirs in exhibitions. I think that there is nothing extraordinary in the request, and I think it is an expenditure of money that could be justified on broad national grounds.

4366. (*Mr. Wilson Fox.*) But it may come to this, when we really come to consider it, that it is as much organisation as money which exhibitors want?—Yes, I think so. It is both—organisation is essential, and money would be a very great help.

4367. (*Chairman.*) You do not want to waste your time, when you have got your things there, in looking for the right man and in getting at the authority?—That is so. And then there is the friction. It means a great deal of trouble. Of course, some of the responsible heads of firms and some of the responsible heads of departments go to look after the matter, but their time is valuable, and the bother and the worry of that sort of thing is inclined to upset the ordinary routine of business. Firms do not like that, and the less there is of that the better.

FOURTEENTH DAY.

Thursday, 21st March 1907.

PRESENT:

Sir ALFRED E. BATEMAN, K.C.M.G. (*Chairman*).
Mr. C. A. HARRIS, C.B., C.M.G.
Mr. MALCOLM RAMSAY, C.B.
Mr. S. J. WARING.
Mr. U. F. WINTOUR (*Secretary*).

Mr. GEORGE COLLINS LEVEY, C.M.G., called, and examined.

Mr. G. C. Levey, C.M.G.

4368-71. (*Chairman.*) I think you have prepared a statement which, to a certain extent, is in answer to our formal questions?—I have not prepared that exactly as a reply to those questions, because it has not been done *seriatim*, but I think it covers all the ground embraced in your questions.

The witness handed in the following statement:—

I represented the Colony of Victoria at the Vienna Exhibition of 1873, at the Sectional Exhibition under Sir Henry Cole held at South Kensington the same year, at the Centennial Exhibition, Philadelphia, in 1876, at the International Exhibition, Paris, in 1878,

and I entirely organised and administered the Melbourne International Exhibition of 1880-81, which was upon as large a scale as any exhibition ever held in this country. I was Executive Commissioner for Victoria at the Amsterdam Exhibition of 1883, and organised an International Exhibition at the Crystal Palace in 1884. I acted as representative of Sir Alexander Stuart, the Executive Commissioner for New South Wales, at the Colonial and Indian Exhibition, South Kensington, 1885, organised the British section of the Adelaide Exhibition of 1887, and was secretary to the Royal Commission for the Hobart Exhibition of 1894-95. Since that date I organised the Greater Britain Exhibition, Earl's Court, in 1899, and was secretary for the Colonial Committee of the Royal Commission at Paris in 1900. I have been present at all the great exhibitions held since 1873, with the exception of Chicago, St. Louis, and Milan.

In my opinion, considerable benefit accrued to British arts, industries, and trades from the participation of this country in International Exhibitions, and the results were such as to warrant His Majesty's Government in giving financial support to similar exhibitions in the future, up to and including the Paris Exhibition of 1878.

Previous to that date these exhibitions were conducted by a Royal Commission, frequently with the present King at their head, but virtually controlled by officials, who possessed considerable exhibition experience. Exhibitors had confidence in the management of these exhibitions, and combined with the officials to make them successful. The first great International Exhibition with which I was connected, that of Vienna in 1873, was less successful than it otherwise would have been owing to an outbreak of cholera in the Austrian capital. The British section, with which I was associated as representative of Victoria, Australia, was under the capable management of the late Sir P. Cunliffe-Owen; his relations both with the exhibition authorities and the British exhibitors were most cordial, and although the attendance of the general public was not so large as it otherwise would have been, owing to the circumstance mentioned above, I heard no complaints from exhibitors, who, on the contrary, considered that they had been afforded an exceptional opportunity for bringing their products and manufactures before the people of Austria, Hungary, Bohemia, Turkey, and what were then termed the Danubian Principalities, but are now known as the Balkan States.

The next International Exhibition in which I took part was the Centennial at Philadelphia in 1876, where I was again in charge of the Victorian Court. The British section had, so I was informed, been organised by Sir P. Cunliffe-Owen, but he was unable to visit Philadelphia during the currency of the exhibition, and the representative of Great Britain was Colonel, subsequently Sir, Herbert Sandford. Here, again, the display made by Great Britain was quite worthy its reputation as the greatest of all manufacturing nations, and the relations between the British Commission and the American officials were most friendly and cordial. Nor were there many complaints on the part of the British Exhibitors, although Philadelphia was the headquarters of the American Protectionist party, and many of the British exhibitors realised that the exports of this country to the United States were not likely to be so large in the future as they had been in the past. But the superiority of British manufactures, especially over those of Germany and even the United States, were marked, although the United States were very strong in machinery, and especially in agricultural implements.

The next European exhibition was that at Paris in 1878. The French Government made great efforts to demonstrate to the world that France had completely recovered from the disasters of 1870, and a very fine display was made by the British Empire, the United Kingdom, India, Canada, New South Wales, Victoria, South Australia, Queensland, and Cape Colony being well represented. The relations between the British Commission and the Executive Commissioner, Sir P. Cunliffe-Owen, with the French authorities, the Colonial officials accredited to him, and the exhibitors were excellent. I was a British Juror in the Food section, and had good opportunities of ascertaining the views of the British exhibitors. They seemed generally well satisfied with the results of the exhibition, in which the British Empire held the foremost position. Germany was not represented at all, and the United States very poorly.

The United Kingdom voted public money to the exhibition at Sydney, 1879-80, and Melbourne, 1880-81. The British display was good, but as I was present at both, having organised the latter, I could not help realising the superior organisation of the foreign as compared with the British sections. France, Germany, Austria, and even Belgium and Italy appeared to have ample funds for the ornamentation of their Courts, which presented a thoroughly artistic appearance. Sir Herbert Sandford, who represented Great Britain, had no funds for that purpose, and if it had not been that the Colonial authorities expended some money in the ornamentation of the British Court it would have presented a very unattractive appearance. The general feeling in the Colonies was that foreign nations were making a determined effort to capture British trade, and that the Home Government was not sufficiently alive to the possible results of their efforts. Among the incidents which followed the two Australian Exhibitions were the establishment of direct lines of steamers from France and Germany to Melbourne and Sydney, the opening of a French bank in Australia, and direct shipments of foreign produce, instead of, as formerly, via London or Liverpool, and a very large increase to the exports from the Continent to Australia, which became so considerable that the mail steamers to Australia took cargo from Antwerp.

From 1881 there has, in my opinion, been a want of system in the management of the British section of exhibitions, side by side with a decided falling off in the number and attractiveness of the British exhibits. At many International Exhibitions which were commercially important the United Kingdom was not represented at all, or, at any rate, had no official representative. The latter was the case at the Amsterdam Exhibition of 1883, although India, New South Wales, and Victoria took part, and I was Executive Commissioner for the latter Colony. In most cases when the United Kingdom participated, and expended large sums of money, the object was rather political than commercial, such as at Chicago. Many minor exhibitions were neglected altogether, or, if this country put in an appearance, it was not officially. The management was sometimes in the hands of a Royal Commission, sometimes in that of the Society of Arts, sometimes in that of a Mansion House Committee. That the United Kingdom was represented in Paris at all in 1889 was owing to the energetic action of the then Lord Mayor, Sir Polydere de Keyser. On that occasion the British and Colonial section covered 218,000 square feet, as compared with Belgium, 120,000 square feet; the United States, 113,000 square feet; and Switzerland, 65,000. Many monarchical countries were not represented at all, because the exhibition was held to celebrate the centenary of the French Revolution. But for the first time the British exhibits showed a falling off as compared with the display made by this country at the previous Paris Exhibition. Sir Henry Trueman Wood, in a paper read by him before the Society of Arts, stated that the space occupied was only two-thirds the former amount, and the number of exhibitors about one-half. Their quality must be a matter of opinion.

The United Kingdom did not make a brilliant display at the various exhibitions held in Belgium and Spain during the 90's, although strenuous efforts were made by private individuals to maintain the commercial honour of their country. I was not present at either Chicago or St. Louis, but I do not think the general verdict at either place was satisfactory so far as this country was concerned. The exhibits were in themselves admirable, but they were not displayed with any artistic effect, or to the best advantage, although the system of collective exhibits adopted at St. Louis was a distinct step in advance.

I can speak unhesitatingly about the inferior position occupied by this country at Paris in 1900, when compared with the United States and Germany. The methods of this country compared very unfavourably not only with those of the United States and Germany, but of such countries as Austria, Hungary, and Russia. Everything in the German sections had been carefully thought out, and the result was a triumph not only for German business methods, but also for their good taste and appreciation of beauty.

Upon the whole, I should be inclined to say that the money spent since 1880 has not been well spent, and that even if the amount had been larger the result would not have been satisfactory, owing to want of system. As a matter of fact, the expenditure of Great Britain has been very small when compared with that

Mr. G. C. Levey, C.M.G.
21 Mar. 1907.

of other great Powers. Thus, at Paris in 1900 the figures were as follows:—

Report of the French Commissioner-General—Vol. I., 256 Vol. IV., 121.

——	Exhibitors.	Space Occupied.	Expenditure.
		Metres.	£
Great Britain -	3,193	32,512	100,000
United States -	7,610	32,047	285,000
Germany - -	2,696	53,512	250,000
Hungary - -	3,249	13,670	147,000
Russia - - -	3,179	27,554	256,000
Austria - - -	1,092	15,900	126,000

It is only fair to state that the British Colonies and India spent something like £40,000. While Great Britain loomed largely both in space occupied and number of exhibitors, her expenditure was about one-third that of the United States, less than half that of Germany and Russia, and much less than that of Austria and Hungary.

The truth is that international exhibitions have not been regarded seriously either by the Government or exhibitors of this country. Some of the lukewarmness of British exhibitors has been caused by the fiscal policy of the United Kingdom. Exhibitors complain that the information afforded by the exhibits to foreign manufacturers and to the jurors who examine the British products more than counterbalanced the undeniable advantages afforded by the advertisement of those wares to foreign consumers. When it was pointed out to British exhibitors that they had the same facility for examining the exhibits of their foreign competitors that these had in inspecting theirs, the reply was that the high price of British labour made competition with foreigners difficult, and that the high tariffs made it impossible. It was in vain that I have pointed out to British manufacturers, as I have done on many occasions, that notwithstanding all the obstacles in the way, the British export trade to foreign nations was larger than that of any other country. The reply in many cases was that they did not care to exhibit.

The great defects of the British system are:—

(1) Want of organisation in the management.
(2) Want of system amongst the exhibitors.

I have already pointed out that there have been three ways of administering the British section of great international exhibitions. It is not fair to criticise the efforts of the Society of Arts or the Lord Mayor's Committee asked to undertake a work for the performance of which they had no adequate machinery, and very insufficient funds. But when a Royal Commission has been appointed the usual system has been to place the executive control in the hands of gentlemen who have had no previous experience of exhibitions or the requirements of exhibitors. Of the three gentlemen—Colonel Jekyll, Mr. Earle, and Mr. Spearman—who were in charge at the Paris Exhibition of 1900, only one, Colonel Jekyll, had any lengthy official experience, and his only knowledge of exhibitions was that he had held the position of secretary to the Royal Commission for the Melbourne Exhibition of 1889, and on that occasion the greater portion of his work consisted in organising the Fine Arts Section.

It is probable that during his connection with the Paris Exhibition he gained a vast amount of useful experience, but at its close he received promotion and a permanent position, and when a Royal Commission was appointed for the St. Louis Exhibition another Engineer officer of great ability but no exhibition experience was selected as chief executive officer. It is impossible with such a system or want of system, to produce satisfactory results, although I am bound to say that the system of collective exhibits introduced for the first time at St. Louis was a great improvement upon previous methods.

Nor are exhibitors free from blame. The manufacturers of this country do not attach the same importance as those of foreign countries to exhibitions. These latter regard them as an admirable means for extending their trade, and obtaining new clients. In two countries the local manufacturers, producers, and merchants have established a powerful organisation which enables them to obtain the maximum of display at the minimum of cost. French exhibitors found as far back as the eighties that by isolated action they were placed at a disadvantage, and they formed the Comité Francais des Expositions a l'Etranger, which systematises the efforts of individual exhibitors and welds them into one harmonious whole. The French Government virtually leaves the question as to whether France should or should not participate in an international exhibition to the decision of this Society, and if it should decide that it is for the advantage of French commerce and industry that France should participate, this Society takes the matter into its own hands and arranges everything. The Society is composed of the principal manufacturers and producers of every department of French industry, and is worked upon co-operative principles, without profit to any individual. The method adopted by France has recently been adopted by Belgium, and I believe Japan.

I consider that all exhibition matters should be left to such a society, but that it should work in conjunction with a department of the Board of Trade; that the President of the Board of Trade should be the official head of the Society; and that a gentleman of taste, executive ability, and exhibition experience should be placed at the head of the department of exhibitions, who, with the president of this Society, should decide whether this country should take part in any exhibition, and should recommend the amount of subsidy, if any, which should be given.

Of course, the success of this department would depend almost entirely upon the selection of the gentleman who was at the head of the department of exhibitions.

4372. (*Chairman.*) I see from your statement that you have been concerned with exhibitions for a very long time; indeed, since so far back as 1873?—Yes.

4373. In that year you represented the Colony of Victoria at the Vienna Exhibition?—Yes.

4374. Then you were connected with the sectional exhibition at South Kensington in the same year, with the Centennial Exhibition at Philadelphia in 1876, with the Paris Exhibition of 1878, with the Melbourne Exhibition of 1880-81, with the Amsterdam Exhibition of 1883, and with an International Exhibition at the Crystal Palace in 1884. Then you were at the Colonial and Indian Exhibition at South Kensington in 1885, you organised the British Section of the Adelaide Exhibition of 1887, and you were secretary to the Royal Commission for the Hobart Exhibition of 1894-1895. Later on, you organised the Greater Britain Exhibition at Earl's Court in 1899, but, of course, you do not call that an international exhibition?—No.

4375. Then I think you were secretary for the Colonial Committee of the Royal Commission for the Exhibition at Paris in 1900?—Yes.

4376. And you say you have been present at all the great exhibitions held since 1873, with the exception of Chicago, St. Louis, and Milan?—Yes.

4377. Those are three rather large exceptions, are they not?—Yes, they are.

4378. You think that a considerable benefit has accrued from the participation of this country in international exhibitions?—Yes.

4379. Up to and including the Paris Exhibition of 1878, you think the Government took a stronger part than they have since?—They took a stronger and more successful part than they have since, and there was better organisation.

4380. You say that previous to that date these exhibitions were conducted by a Royal Commission; since that date, have not the big exhibitions all had Royal Commissions?—Some, but not all.

4381. Take Chicago, Paris, and St. Louis?—The British section at Chicago was really arranged by the Society of Arts.

4382. The Council of the Society of Arts was formed into the Commission, was it not?—Yes; you could not call it a Royal Commission in the ordinary sense of the term.

4383. I see that you took a part in the International

Exhibition of Philadelphia in 1876, where you were in charge of the Victorian Court?—Yes.

4384. There you were well satisfied with the display made by Great Britain?—Yes. The British section had one of the positions of honour at the Philadelphia Exhibition, and made a very fine display.

4385. They had a very good site, I believe?—Yes, a very good site. Up to that exhibition at Philadelphia in 1876, English manufacturers did a very large trade with America, because the protective policy had scarcely been introduced. There was then a great willingness on the part of British manufacturers to exhibit in America, because they saw that a great trade advantage might result from it.

4386. We have been told by several witnesses that the high tariff has stopped their trade with America a good deal of late years?—That would be so.

4387. Going now to the Paris Exhibition of 1878, you say that a very fine display was then made by the British Empire?—Yes.

4388. And the British Empire held the foremost position?—Yes.

4389. You put it, I think, as one of the reasons why our display shone as one of the best, that Germany was not represented at all, and the United States were very poorly represented?—Yes.

4390. Then we come to the two smaller exhibitions, at Sydney and Melbourne?—I cannot accept that term as regards the Melbourne Exhibition. The exhibition at Melbourne was a larger exhibition than has been ever held in this country. It was quite on the lines of the 1862 exhibition held at South Kensington. It was not a small exhibition; it was as large as any of the old exhibitions, though, of course, it was not on the same scale of magnitude as the modern exhibitions have been.

4391. It is in reference to these two exhibitions that you begin to comment, in your statement, on the want of funds for the British section; but there was public money voted for these Colonial exhibitions, was there not?—Public money was voted, but not sufficient. I think nearly the whole of the public money voted for the Melbourne Exhibition was devoted to the salary of Sir Herbert Sandford and to the Art Collection. When Sir Herbert Sandford came out there, he had absolutely no money whatever to administer his court, and we were obliged to vote him money for the salary of a clerk, and for the decoration of his court.

4392. Who voted that money?—It was defrayed out of the general funds of the exhibition granted by the Government of Victoria.

4393. I see you date from those two exhibitions the establishment of direct lines of steamers from France and Germany to Australia?—That was contemporaneous, and I think the exhibition had a great deal to do with it. The fact was that the local consumers in Victoria for the first time found out that Belgium produced glass, and that Germany produced, to a very large extent, two things, namely, cement and iron wire for fencing. So they opened up direct relations with various foreign manufacturers, and the result of that was that there were lines of steamers started direct, and the P. and O. had to open up communications with Antwerp.

4394. Apparently that result came from the activity of the Belgians and the Germans, and not from the apathy of the British exhibitors?—It arose from the fact that the French and the German exhibitors were much more in evidence than the British.

4395. Was it the fact that the British exhibits were poor at those exhibitions?—No, they were very good, but they did not bear anything like the relation that they ought to have done to the magnitude of the trade which at that time existed between Australia and England. Nine-tenths of the trade then between Australia and European countries, or more than that, was with England; after that, it was much more evenly divided. What I mean to say is, that the British exhibits at that Melbourne Exhibition did not bear any proportion whatever to the importance of the trade between Great Britain and Australia.

4396. Now we will go on to the Paris Exhibition of 1889. There you say, for the first time, the British exhibits showed a falling off as compared with the display made by this country at the previous Paris Exhibition in 1878?—Yes.

4397. That was, to some extent, on account of the Government taking no part at all in the exhibition, I suppose?—The Government took no part in it. The exhibition was managed by the Lord Mayor and the Lord Mayor's Committee. I have given a quotation from Sir Henry Trueman Wood's speech, which gives statistics.

Mr. G. C. Levey, C.M.G. 21 Mar. 1907.

4398. "The space occupied was only two thirds the former amount, and the number of exhibitors was about half. Their quality must be a matter of opinion." Was that what Sir Henry Wood said?—Yes; he said that in a paper which he read before the Society of Arts.

4399. What is your opinion about the quality of the British exhibits at that Paris Exhibition?—I should have said that the quality was poor; but, of course, he did not care to say so in so many words.

4400. Then you go on to say that the British exhibitors did not make a good show in the exhibitions that went on in the 90's in Belgium, Spain, and so on?—Yes, in my opinion that was so.

4401. You were not present, as you have said before, at Chicago or at St. Louis?—No.

4402. But you do not think the general verdict at either place was satisfactory so far as this country was concerned?—That is so.

4403. You are aware, no doubt, that there were large sums voted for both those exhibitions?—There was a large sum voted for St. Louis, and I think that at St. Louis there was a distinct improvement in the way they adopted the system of collective exhibits. By that means they assisted financially a large number of the smaller manufacturers, and they made a very much better display than they otherwise would have done. They had a very considerable vote at St. Louis—something like £150,000.

4404. Then I take it you are in favour of collective exhibits for a number of our goods?—I am, very much so.

4405. What particular goods would you say especially lend themselves to a collective exhibit?—I think nearly all—not, of course, heavy machinery, but ceramics, textiles, glassware, and cutlery, all lend themselves to collective exhibits. In my statement, I have given some figures about the expenditure at the Paris Exhibition of 1900; I do not know whether you have had them already.

4406. Thank you, we have got those. When you say you are in favour of collective exhibits, do you mean that you are in favour of each nation being represented separately, or would you class the articles of all countries by their kind?—I think from the point of view of the nation, it is very much better that each nation should have its own court.

4407. There is rather a difference of opinion as to the arrangement of collective exhibits, especially having regard to the convenience of judging articles of the same class from various nations?—That could always be got over if you adopt the system of having a large court, and having the nations, France, England, Germany, and so on, arranged longitudinally, and the different classes of articles, ceramics, for instance, arranged transversely. For example, supposing you had the exhibits of France, England, Germany and Austria arranged lengthwise, and then the classes of articles, such as ceramics, cutlery and textiles arranged crosswise, then if you went through the exhibits in one direction, you would see all the ceramics, say, of the different nations of the world, and if you went through it in the other direction, you would see all the exhibits from each separate country. That was the system adopted at the Paris Exhibition of 1878, where, if you wanted to do so, you could see all the exhibits of Great Britain together, and if you wanted to see all the ceramics of the world, by walking in the other direction you could do that. That is, to my mind, the very best system for arranging an exhibition.

4408. (*Mr. Harris.*) But that would have been impossible at the Paris Exhibition of 1900, would it not?—It would have been impossible at Paris in 1900, because the exhibits were divided over such a large number of buildings.

4409. (*Chairman.*) For the plan you suggest, you want an enormous square block, do you not?—Yes. I take it that the enormous size of modern exhibitions has made anything like a systematic arrangement impossible. In Paris in 1900, from one building to

Mr. G. C. Levey, C.M.G.

21 Mar. 1907.

another was sometimes a distance of a mile and a half, or, I might say, two miles, and it was a day's work to go from one end of the exhibition to the other. In those circumstances, anything like systematic arrangement became almost impossible.

4410. The same was my experience at Chicago?—It was the same at Chicago. I have a friend who took part in the British Exhibition there, and he told me that in that case you had a great agricultural hall and you had a great machinery hall, and between them you had enormous areas to traverse. Of course, you always must have your machinery hall separate, but the modern system of having separate buildings for every description of manufacture makes a systematic arrangement virtually impossible, and adds enormously to the expense of administration. For example, Germany, which spent a great deal of money at the Paris Exhibition, as I say in my statement, had to make four or five trophies—and magnificent displays they were—whereas under the old system they would have made only one.

4411. Under the old system, you would not have so many separate beautiful buildings, I suppose?—No, you would not. You would have a smaller number of very large buildings. I think the modern exhibition is a sort of megalomania, and each has tried to be larger than the other; but they defeat their own purpose.

4412. So far as the British Section is concerned, what is your criticism of it in the last two exhibitions?—I should say it has been badly managed except in the introduction at St. Louis of the system of collective exhibits.

4413. From top to bottom?—No, not from top to bottom. But I would rather not say badly managed. I think they have not been as well managed as they might have been. I do not think it is right to say they have been badly managed, because all the officials have done their very utmost to make them a success, but, generally speaking, the officials at the head of them have not had any exhibition experience.

4414. Surely several of the officials at some of the recent exhibitions have been previously employed on exhibition work?—The staff have had exhibition experience, but the policy has been always arranged by the chief.

4415. There has been a different chief commissioner, I think, each time?—Yes, there has. If you take Paris in 1900, of the three principals of the exhibition, Sir Herbert Jekyll, Mr. Earle and Mr. Spearman, the two latter had really had no exhibition experience at all, and Sir Herbert Jekyll had only had a very little. He was a very able officer, and no doubt he learnt a great deal at that exhibition, but then he has not been employed on another exhibition. At the next exhibition, another gentleman was employed, who, I likewise believe, was an extremely able man.

4416. That was Sir Charles Watson, who was then Colonel Watson, or Major Watson, I think?—Yes. He was a very able man, and I am rather inclined to think that he picked up a good deal of exhibition experience in his time.

4417. That points to your idea that there should be some permanent organisation for organising the British exhibits?—I think there should be a permanent organisation.

4418. Are you acquainted with the French and German systems of organising exhibitions?—I know the French system.

4419. What do you think of the French system?—I think the French system is an admirable one. Perhaps I may just mention my own experience with the French system of organisation. I tried to induce the French Government to come to Earl's Court and have a large exhibition there.

4420. When was that?—I saw them in 1901, I think it was. I had some acquaintance with the Minister of Commerce, and I discussed the matter with him very fully. He said that from a political point of view, nothing would give him greater pleasure than to see an exhibition at Earl's Court, but after having said that from the political point of view, he said that all matters of detail must be decided by *Le Comité Français des Expositions a l'Etranger*. I then had to go before that Committee, and I argued the matter with them. The president of Earl's Court, M. Cremieux Javal, did the same. We had several interviews, but the result of them was that they came to the conclusion that it was not advisable in the interests of French commerce to come to Earl's Court, and so it dropped. That seems to me to be an ideal system.

4421. Though they did not come into what you wanted, you thought that your proposal was well and carefully considered?—The proposal was thoroughly considered. I fought my ship as well as I could, but unsuccessfully. At the same time, I feel perfectly certain that the decision arrived at, although I do not say it was a right one, was arrived at carefully and deliberately.

4422. What is your opinion of their methods of getting hold of exhibitors?—Nearly every man in France who is likely to be an exhibitor is a member of the *Comité Français*.

4423. Are there as many people in the south of France who are members as there are round about Paris?—Yes. They have an enormous clientèle—several thousands. They have the silk people of Lyons, the manufacturers of Roubaix, and the manufacturers of Limoges, the wine growers and the olive growers—they are all in the society. If that society says, "We have come to the conclusion that it would be advisable for the French exhibitors to go to any country you like"—Ruritania, we will say—then the individual exhibitor feels that it has been carefully and maturely considered, and that it would be very much to his interest to go there if he can make arrangements to do so. They do everything in a large way, and they know exactly the tradesmen to employ, and the furnishers to go to, and so they make a very fine and showy display at a comparatively small price. They make a collective bargain with the exhibiting nation for the charge for space, and then they apportion that out amongst their clients. The result of that is that they get together a very fine exhibition at a, comparatively speaking, small expense—small, that is, as compared with the effect they produce.

4424. Do you think such a society would be possible in this country?—I see no reason why there should not be one, if you could get British manufacturers to look at exhibitions from a serious point of view; but—I am only reiterating what every British Consul in foreign parts says—British manufacturers do not understand advertising in foreign countries, and they do not understand how to keep their wares well before the public.

4425. Take the textiles coming from Yorkshire, which will be in fashion six months hence, you would not have the manufacturers exhibit them so that their patterns could be copied, would you?—I would not have them exhibit things which are of an ephemeral character; that, perhaps, would be unwise. But there are an enormous number of things which are not of an ephemeral character. For example, I have got in my mind an exhibition which I saw, at which there was a very considerable number of English cloth manufacturers exhibiting, and also cloth manufacturers from Verviers in Belgium. The English cloth manufacturers exhibited great rolls of cloth all over the place, but with no organisation or attempt at display. On the other hand, the Verviers court was an exceedingly pretty court, with all the cloths and other things very nicely arranged, and everything shown to the very best advantage. Anybody going into those two sections would have supposed Verviers was infinitely more important than the West Riding of Yorkshire.

4426. I suppose our people are content with ordinary advertising, and with selling their goods through agents and merchants abroad?—Yes; for example I have seen a South American town covered over with posting-bills in the English language.

4427. Still you think that some such society would be possible in this country?—I see no reason why it should not be. If such a society could be organised and started by people who could inspire the notion that it was not done merely to exploit the promoters of the society, I think that English manufacturers would be very glad to join such a society.

4428. You say you think that the President of the Board of Trade should be the official head of such a society?—I think so.

4429. And that there should also be a small permanent department for exhibitions?—Yes.

4430. Their duty being to keep the records of exhibitions and carry on the traditions?—There should be

a small permanent department, so that the experience of one exhibition might not be lost to the management of another.

4431. What is your opinion about the awards at exhibitions; would you keep them on. Do you think they are still looked upon as valuable?—I think they are looked upon as very valuable, but I am not so sure about their always being awarded according to the merits of the exhibit. At Paris in 1900 the system was an extremely wise one, so far as the group juries were concerned, but then the decisions of those group juries, who really made a careful examination of the products, were very often overruled by the superior jury, who had no real knowledge of the matter at all. These decisions of the superior jury were very frequently given from political causes, rather than upon the merits. For example, they would say, "Well, Spain has not got more than so many gold medals; we ought to give her a few gold medals"; or "Great Britain has got rather more gold medals than she ought to have, and we must cut some of them down." That sort of feeling is allowed to influence the superior jury, but the group juries took an enormous amount of trouble, and made, to my mind, extremely equitable decisions. I was a member of the group jury for agriculture, and I am sure that we were most painstaking; and it was very mortifying, after we had come to decisions, after a great deal of trouble, to find that they were interfered with—not always, but to a certain extent—by the superior jury who knew nothing whatever about it. For example, I recollect getting the very highest award for a Canadian plough, which certainly was the best plough in the exhibition. It was admitted to be so. But that was cut down by the superior jury, who had never seen the plough, and knew nothing whatever about it. They thought it an impossible thing that a Canadian plough should be better than the ploughs of other nations, which were better known, and much larger.

4432. Do you go so far as to say that the awards were given to a certain extent upon the reputation of the firm or of the country, rather than upon the excellence of the article itself?—Those considerations are allowed to have too great an influence; I do not mean to say that they are the only things which are considered, but too much importance is attached to them.

4433. Still, with all the faults of the system you would not do away with awards?—No, I would not.

4434. Then as regards what should be paid for the exhibitor in the case of his exhibits, do you think he should be assisted as regards the cost of space?—I think that in an international exhibition an exhibitor should have free space. If the Government are very liberal they might give him free freight and free transport, but I do not think that is essential. What is required is that there should be some cheaper method of organisation which, as I suggest, could be done through that society. As it is now, supposing I lived in a country town and were a glovemaker, and I wanted to exhibit at a large international exhibition, I should have to arrange all my organisation for the representation of my goods. Either I should have to send someone there during the whole time of the exhibition, which is extremely expensive, or I should have to leave my affairs in the hands of an exhibition agent, who knows nothing about gloves, and probably does not care very much about it beyond getting his fee. If there were a society such as I suggest, the expense of the representation would be reduced to a minimum, and at present that representation is a most important thing to a manufacturer.

4435. The society you suggest would take care that your goods were properly shown and properly considered at that exhibition with not much cost to you?—Yes. If I were a very large manufacturer I could afford to send my own representative. For example, such people as Armstrongs, of course, would have their own representative, but a small manufacturer cannot afford that, and his interests would be very much better looked after by such a society than by an agent.

4436. There are several agents, but you do not think that the agent is quite capable of looking after the various articles which are exhibited?—I think the agents act honestly and fairly as a rule, but in the first place they have no technical knowledge of the various trades.

4437. Not of all trades, perhaps?—They have no technical knowledge of all the trades which they represent. In the second place, their fees become expensive. Then, again, there is a very vicious system which prevails—I do not say universally, but it does prevail to a certain extent—of making their fee dependent on the kind of award a man gets.

Mr. G. C. Levey, C.M.G.

21 Mar. 1907.

4438. I do not know that we have heard of that before?—I do not say that that prevails universally, but it does prevail to a certain extent on the part of exhibition agents.

4439. Do you mean that if you get a *diplôme d'honneur* you have to pay a high fee for it?—"I will give you £50 for acting as my representative in Ruritania, but if you get me a *diplôme d'honneur* I will give you £100." That is the sort of thing.

4440. Do you know of your own knowledge that that has been done at several exhibitions?—I know that it has been done, but I could not say that it is universal or frequent.

4441. But you have known of cases?—I have known of cases.

4442. In recent exhibitions?—I will not say in recent exhibitions, but in exhibitions which have been held during the last thirty years. You can easily see that that is a system which it is quite possible may exist. There is one point I should like to add: Although I would have the permanent exhibition department a very small one, merely to preserve the continuity and to preserve the traditions—and I think that might be done quite well by the Board of Trade in a, comparatively speaking, inexpensive way—yet I quite recognise that the selection of the gentleman who is to be placed at the head of the staff at any exhibition is a very important matter, and that it would be very important that he should be a man of considerable executive ability and of considerable exhibition experience, and also that he should be a man of good taste.

4443. (*Mr. Malcolm Ramsay.*) Has practically all your time been taken up with one exhibition or another in recent years, or have you any other profession besides that of organising exhibitions?—There have been years in which I have had nothing to do with exhibitions. During that time I have lived, to a certain extent, on my private resources, and I have been a good deal connected with journalism.

4444. I asked that because I wanted to know what was your experience of trade; that comes chiefly through organising exhibitions, does it not?—Exclusively. I have never been connected with any manufacturing trade.

4445. Your opinion, I understand, is that exhibitions are distinctly favourable to the export trade of the country?—I am very much of that opinion.

4446. Do you think they increase the aggregate export trade?—Yes.

4447. You say in your statement that before 1878, I think it was, or at any rate, in the earlier exhibitions, the Government did better than it has done at the more recent ones?—Yes.

4448. Do you think that may be accounted for to a certain extent by the fact that at the earlier exhibitions our foreign commercial rivals were not nearly as formidable as they are now?—They utilised these various exhibitions and we did not. That is one thing. Another thing is that the present King, when he was a much younger man, took a very active part in these exhibitions, and the fact that he was at the head had a very considerable effect in inducing British manufacturers to exhibit. Then you had in Sir Phillip Cunliffe Owen an extremely able man, who was on very excellent terms with all the manufacturers, as well as with all the officials. He managed always to get together a very fine collection of exhibits. Up to 1878 I do not think foreigners realised what exhibitions could do, but in proportion as they began to strengthen we began to weaken. As I said before, Germany was not represented at all in Paris in 1878, for political reasons, and the United States was only represented very poorly. On the other hand, Russia made a very magnificent display, not for commercial, but for political reasons; they were anxious to bring about a good feeling with France, and they did so. What I want to point out really is that as they strengthened, we weakened.

4449. Setting aside the increasing competition of other nations, you think that our organisation has latterly been less effective than it was before?—Yes.

4450. When you were speaking of the French system you instanced your negotiations with a view to an ex-

Mr. G. C. Levey C.M.G. 21 Mar. 1907.

hibition at Earl's Court, and you told us, I think, that the Minister of Commerce decided the policy, and it was left to the society to decide the business aspect?—Yes.

4451. Who do you think should decide the business aspect, if we applied that kind of system to England?—If there were such a society, the society. If not, the Board of Trade.

4452. How would you suggest that that society should be composed? Should it consist of representatives of the large manufacturers, and so be an unofficial organisation, that is to say, an organisation not undertaken by Government?—Yes.

4453. Or should it have some official representative upon it, and be a Board of Trade organisation?—The President of the Board of Trade ought to be the nominal head of it. He ought to be what they call the *President d'honneur*, and he ought to know what is going on in the society. He ought to have, probably, some representative to take a part in it. But the society itself should be strengthened, and the good working of it should depend upon its being entirely in the hands of the exhibitors themselves.

4454. Therefore, as soon as any Department of the Government had decided whether it was politically advisable to take part in an exhibition, the matter should then be referred to this society, who would advise as to the practical benefits likely to accrue from it?—Yes. This society would probably say we ought to have a vote of so much money, and then it would be a matter for the Government to decide whether they would give it.

4455. Do you not think that would lead to increased demands on the public exchequer for representation at these exhibitions?—I am rather inclined to think that an additional expenditure would be in many cases very advisable. But the Government would always have the power of saying "No." Another thing is this: By the present system our Government scarcely ever takes part in an exhibition as early as it should do; the thing is always postponed for a very considerable time, and then they only go into it at almost the eleventh hour, when it becomes more expensive.

4456. I think you told the Chairman you considered it would be practicable to get the manufacturers to combine into an organisation of this kind?—I think it would.

4457. Notwithstanding the aloofness which many of them have shown in the case of recent exhibitions?—Yes. I think, if they thought that they or their representatives would have a very large say in the whole organisation and the general policy and the whole working of the exhibition, they would be very much more willing to come in than they are now, when they are entirely under the control of an official who may or may not have sympathy with them. Some officials are extremely sympathetic to exhibitors, other officials are not; but I take it that the officials of a Department like the Board of Trade would be infinitely more likely to be sympathetic to exhibitors, and look after their interests, than the officials of the Foreign Office would be.

4458. May I infer from that that it is your opinion that manufacturers would like to exhibit now, but are deterred from doing so, because they think the organisation is not as perfect as it might be?—That is almost too strong a word to use, "deterred." I think they would be more likely to come in if there was such an organisation as that which I suggest. I do not say that they are deterred, because I should be very sorry to think that any manufacturer did not expect to get full justice and sympathy from the officials; but he would get a more intelligent sympathy, I think, if it were in the hands of such a society as I suggest. And, again, as I want to impress on this Committee, the expenses of his representation would be very much less than they are now.

4459. Do I understand you to think that, taken as a whole, our British manufacturers are less enterprising and less alive to their true interests than their foreign competitors are?—I am sorry to say that I think they are. I think the English manufacturer concentrates all his energies on the production of his article, and I think in that he is not excelled by any other country in the world, but when it comes to selling his article he takes a very back seat indeed. I think English commercial agents, English *commis voyageurs*, are infinitely less able than the same class of men in foreign countries—not in working their own affairs, nor in travelling in Liverpool or Sheffield or Plymouth, but when they go abroad. In the first place, scarcely any of them know anything about foreign languages.

4460. Does that objection apply to exhibitions?—You asked me a question whether I thought English manufacturers were less alive to their interests than other manufacturers. I say yes; not in the production of their goods, in which I think they are not rivalled, but in the sale of them, in which I think they are.

4461. As regards such a matter as exhibiting, do you consider that they are not alive to the true advantages which can be got out of it?—I do not think they are.

4462. Of course, a certain proportion of manufacturers find it a very good thing, and they do go in for exhibiting; for example, Doultons, and the makers of some kinds of machinery, are fully alive to the advantages of exhibiting. But would you say that those who have not gone to exhibitions are not alive to their own interests?—I think they are not alive to their own interests. Take that very firm of Doulton's; Doulton's have been made by exhibitions.

4463. May not Doulton's be a business which has a peculiar adaptability for that particular form of advertisement? The ware is of a kind which can be easily taken abroad, and which rather gains by being shown on a large scale, and therefore can be better advertised by being taken to an exhibition than by being advertised by a commercial traveller?—I do not quite follow that.

4464. I was asking you whether you think that some trades might get a much greater advantage out of advertising in the form of an exhibition than others would?—Yes, certain trades would. In the case of certain trades an exhibition would be very expensive, and would not be so useful as it would in other trades. I scarcely know any trade in which a commercial traveller going round the world could take an efficient number of samples. For instance, take carpets. Supposing a man comes to you with a piece of carpet about the size of this sheet of paper; it produces no effect whatever. On the other hand, if you see at an exhibition a large fullsized carpet, you see at once what the carpet is. I think that although exhibitions are more advantageous to some trades than to others, they are advantageous for all trades. You will see at some of these large international exhibitions that some of the great machinery people and some of the great engineers go to enormous expenses in exhibiting.

4465. I suppose you are generally aware of the amount of the grants that have been given by the Government to various exhibitions?—I am generally aware. I know there was £100,000 granted to the Paris Exhibition of 1900; I know there was £150,000 for St. Louis; and I think that for Chicago the figure was something in the neighbourhood of that.

4466. Is it your view that the Government has spent too little on the whole at exhibitions, or that it has not got the greatest advantage out of the money which has been voted?—I think that the Government might have voted more money with advantage, but I think that it has not been altogether wisely spent. For example, I do not see very much commercial advantage in exhibiting in the United States, but then on the other hand there is a very considerable political advantage to be gained by it.

4467. The political aspect is not one with which we are immediately concerned?—I understand.

4468. (*Chairman.*) We are looking to the commercial aspect now?—Looking at it from the commercial point of view, I should not feel inclined to spend much money upon exhibitions in the United States.

4469. (*Mr. Harris.*) You informed Mr. Ramsay that the foreigners grew stronger as we grew weaker; but do you not think that the explanation of it might be that the English trader felt that he had really got all he could out of exhibitions, and therefore he was dropping them?—I think that that was to a great extent the feeling. I think they thought they had spent a lot of money in advertising themselves, and that they now might rest on their laurels. But I think that is a very unwise policy, and I think everybody who has tried it finds that out. There are certain trades which have been made by publicity and by advertising, and they have to go on with it. If they begin to cease their advertising, their trade ceases in the same ratio. I think that feeling was very strong amongst English

manufacturers some 20 years ago, and they thought that they had an idea that the world was in their hands, and that there was no necessity for them to do very much more.

4470. May I gather that you would meet that by a collective exhibit, as you suggested to the Chairman?—Yes, if I could not get the manufacturers to go in any other way. I am supposing a condition of affairs in which the whole of the exhibits would be in the hands of such a society. Failing such a society, I think I would follow the policy which was pursued recently at St. Louis. I would have a collective exhibit, of which the Government should pay a very considerable proportion of the expense; but if a man had his own exhibit, then he must take it on himself.

4471. In the case of a collective exhibit, would you have the names of the manufacturers composing it displayed?—I think so.

4472. Do you mind telling us what your general impression has been of the show made by Great Britain at exhibitions you have been at lately—was it good or bad?—I would not say good or bad; I would say fair, certainly not good.

4473. It did not satisfy you as a British subject?—No. I have never seen an exhibition for some time past of which one might suppose that an Englishman going to it would say he was proud of the exhibit made by his country.

4474. I take it that the British manufacturer does not exhibit just for national pride?—No, not at all.

4475. You said just now to Mr. Ramsay that the British manufacturer produces for private demand, so to speak, but when he has produced a good article, will you really go on to say that he does not care how it is sold?—I say he does not know how to sell it in foreign countries.

4476. I know you said he does not know how to sell it, but do you mean that he does not care whether it is sold to the very best advantage or not?—He is very anxious that it should be, but he has got rather an idea that that ought to be done by the merchant and not by him. He has got an idea that the sale of his products is not a portion of his business.

4477. Can you cure that by encouraging exhibitions?—You can cure that by inducing manufacturers to go to exhibitions at a greater rate than they do now. As I said before, the large manufacturer says, "I have got as many orders as I can go on with, and I do not care very much to exhibit; I do not care to exhibit merely for the glory of the thing, and the maxim *noblesse oblige* does not apply to me." On the other hand, the small manufacturer who would be very anxious to exhibit is deterred by the expense, for, as I said before, he has to employ an exhibition agent at a very considerable expense to look after his exhibit.

Mr. G. C. Levey, C.M.G. 21 Mar. 1907.

4478. Supposing Great Britain continues to exhibit, what is the interval which you think it advisable there should be between these international exhibitions?—I think Great Britain ought to appear at all what we may term first-class international exhibitions. Those international exhibitions do not occur more than once every three or four years. For example, there was a large international exhibition in Paris in 1900, there was a large international exhibition at St. Louis in 1904, and there is no large international exhibition on foot now.

4479. Do you think that an interval of four or five years is not making it too frequent to be at all attractive to the exhibitor?—I do not think so, because there are all sorts of new things coming out every four or five years. For example, we had an entirely new revelation some 15 or 20 years ago in cycles; now we have got a similar revelation in motors; and we may have another revelation in aerial navigation—in addition to the improvements which take place in every kind of manufacture. Take agricultural implements; they are constantly being improved.

4480. (*Mr. Malcolm Ramsay.*) You told Mr. Harris that the British exhibit never struck you as more than fair at any exhibition; was that because of the quality of the goods, or because of the quantity and the scale of the exhibit?—Every exhibit was a good one, but the number was small, and they were badly arranged. For example, I recollect in the Paris Exhibition of 1900 going down with an American to the place where there was a large quantity of iron products, and seeing on one side a Swedish exhibit and on the other side an English exhibit. The Swedish exhibit was beautifully arranged and beautifully got up, and everything looked admirable. On the other hand, the Englishman had just dumped down his exhibit in the same way as it had just left the workshop, and there was no attempt made to give any display to it. Anybody going through the place would not fail, as in the case of Verviers and Bradford, to have come to the conclusion that the Swede was a much more important ironmaster than the Englishman.

Mr. WALTER HUNT FELTHAM, called and examined.

4481. (*Chairman.*) What is the name of your firm?—W. H. Feltham and Co.

4482. Of where?—Tooley Street, London, and Southall Street, Manchester. Our principal works are at Manchester.

4483. I understand that you have exhibited at the Paris Exhibition of 1900?—Yes.

4484. What was it that you exhibited?—Cotton bags.

4485. Cotton bags for flour, salt and sugar more especially?—Yes. We were the first firm ever to exhibit such a commodity at any international exhibition.

4486. Then you say in your heads of evidence "also show printing of same for various trades"?—Yes, that was practically to show the printing on the goods, and also what the goods were for.

4487. You say that was a new thing?—It was a new thing as far as exhibiting was concerned. It is a trade that has grown very much during the last 10 to 20 years.

4488. I suppose far more articles are put into bags now than there used to be?—Yes, 50 per cent. more.

4489. You found out a new thing, I suppose, and you simply exploited it?—No, it was not exactly a new thing. It was simply looking after it and adapting ourselves to circumstances and getting other people to fall in with the newer phases of trade.

4490. Do you think you can trace good business from your exhibit at Paris?—I am sure of it—most decidedly.

4491. At home or abroad?—Both—in France and in London as well.

4492. And in other countries?—No. We are rather restricted about that, and it is only to a very few countries that we can go.

Mr. W. H. Feltham.

4493. Is that because of the trusts?—Partly; but, for instance, we cannot touch America, because there is a 75 per cent. duty on everything we should send in. Then, in many countries they do not use anything of the kind, and are not likely to.

4494. It depends, I suppose, on the produce?—A great deal. We can do trade with the Australian Colonies, but we are being kicked out there a good deal by the duties; and we can do a little trade with India.

4495. I suppose you have not experienced any actual disadvantage from exhibiting owing to having your goods copied?—Quite the reverse.

4496. Do you approve of the system of awards at an exhibition, I mean the medals, and so on?—I am a little bit independent about that. As far as I can judge, it is practically in the hands of the agents who take up the representation of certain firms.

4497. Did you not have an agent?—We did not. As far as my memory goes, it was 10 guineas for getting a bronze medal, 20 guineas or 15 guineas for getting a silver medal, and about 20 or 30 guineas for getting a gold medal.

4498. That is payment by result?—Yes.

4499. (*Mr. Malcolm Ramsay.*) Is that what they asked you?—That was one of their conditions.

4500. (*Chairman.*) Was that a printed condition?—Yes. I would not have anything to do with that. I went over three times in one week to see the jury. I went over on a certain day when they did not meet. I

Mr. W. H. Feltham.

21 Mar. 1907.

came back and went over again, and altogether I was over there three times in the one week for the purpose of meeting them. Mr. Behrens, of Manchester——

4501. Do you mean Mr. Gustave Behrens or his brother?—I am not quite certain what was his Christian name, but he was on the jury, and owing to my being there and being able to explain, they really pulled the whole of the stand almost out, and had goods taken out from the glass case and taken away, I think. I put down the fact that I got the award to being there personally myself. We had only a very small exhibit, and it was the first time we had ever exhibited, and in such cases, as a rule, you do not get much recognition.

4502. Still, you got a bronze medal, and I suppose you mean to have a silver or a gold medal the next time?—I should hope so, if I exhibited, most decidedly. We should try to excel our last exhibit, and also, of course, with the experience we have had we should try to do better. But it would not be any good for us to exhibit in places like Germany, or in places like Spain or Italy—having regard to my particular trade.

4503. Because there is no demand there for your goods?—There is no demand for them.

4504. Should you say that you have been induced to buy certain goods from seeing processes or goods exhibited?——Yes. I went round the exhibition, and I saw that Singer's, the machinists, were exhibiting certain new forms of fittings for sewing machines. We have them in our works at the present time, and it was seeing them there that made me adopt them.

4505. You would not have heard of them otherwise, probably?—Certainly not; but we saw them working there.

4506. I need not ask you whether you are likely to refrain from exhibiting in future, because I understand that you will exhibit again?—We should at Paris.

4507. But not at Brussels, say?—We should not exhibit at Brussels. One great thing to a small firm exhibiting, as far as my opinion goes, is the initial expense. It is a heavy expense for a small firm to undertake.

4508. Would you not take part in a collective exhibit?—Where?

4509. Would that method of exhibiting help you as regards expense, if an exhibit was got up by the Government or by a Chamber of Commerce?—Yes. I think that would be a very good thing.

4510. But you would want to keep your own name, of course, on your own goods?—Most decidedly we should, and not to sink it just to form the trade exhibit of a certain country. Competition is quite keen enough, and if you are going to do anything at all you have to be all there. It is no good playing second fiddle.

4511. You are in favour of this country taking part in exhibitions as long as they are important ones, I suppose?—Most decidedly. But, as I say in my Heads of Evidence, I think the committee for an exhibition should be composed of as many business men as possible, who would look at it from different business sidelights.

4512. As regards that, did you have anything to do with the Management at Paris?—Nothing at all.

4513. Did you not want them to help you at any time?—I stood on my own feet practically, and I did not go to them. Of course, it was a little bit difficult, as I was not very conversant with the French language, and they would have been a considerable help to me if I had felt inclined to have gone to them; but I got in touch with some friends there, and I was all right.

4514. You did not require their help?—No.

4515. So you have not any experience to give us of what they did?—I think the committee there were always very willing to give us any help that we wanted as exhibitors.

4516. How did you come to exhibit there. You got a circular asking you, I suppose?—No. I heard that such a thing was coming off about two years previously, and I made application, and was called a fool for my pains for doing it.

4517-21. Did you have a man there all the time?—The whole time.

4522. I suppose it was rather expensive to have him at Paris?—That was rather expensive; and then I was going there continually myself.

4523-24. At future times you would exhibit at Paris; but would you exhibit in the colonies—in Australia, for example?—I would, if we had the chance and the opportunity of going over there.

4525. You did not exhibit in New Zealand this last year?—No.

4526. Why not?—Because it is very difficult to appoint anyone who would understand our goods. You want somebody there who can take a man up and give him a price right away, instead of leaving it to be referred home for prices, for the different sizes, qualities, and so on.

4527. You could not have instructed him sufficiently, then?—Not sufficiently for that. Ours is a very peculiar business, and it takes almost a lifetime to learn it before you get hold of all the intricate points or prices, sizes, printings, and so on. For instance, we make one bag, say a 14-lb. bag, in from a dozen to perhaps 20 different sizes—all to contain 14 lbs.

4528. You mean that the sizes would differ according to the specific gravity of the goods inside?—Yes. You want to be up to that. A man comes up and says, "I want a bag to hold 14 lbs. of lead"; another one will say, "I want a bag to hold 14 lbs. of flour"; and another one will say, "I want a bag to hold 14 lbs. of salt"—they all would want different sizes.

4529. (*Mr. Harris.*) Do you mean those particular bags, for instance, that are so commonly used for selling flour in England?—Yes.

4530. (*Chairman.*) I suppose the specific gravity of all flour is about the same, is it not?—No.

4531. Does it vary much?—We should make, I should think, for a 7-lb. bag quite a dozen different sizes, all to contain 7 lbs. of flour.

4532. Generally, you have not had much to do with the organisation, but you think that we ought to have on the committee business men, if possible?—I do, most decidedly.

4533. But you would have a Royal Commission, I suppose?—Yes, most decidedly. I think if the committee were appointed and carried on something like the Board of Trade is being carried on at the present time there would be much good done by it. According to my experience, we want to take up these things on a more business line, and there ought not to be so much red-tapeism about it. If we were to carry on some of our private business in the same way as some of the Government officials do theirs, we should be nowhere—we should not—there is no question of it. Somebody wants half-a-day's holiday, and you have got to get that signed by four or five different people, and it does not concern No. 5 a bit—it has nothing to do with him—yet he has to sign it.

4534. I am glad you rather except the Board of Trade from these censures?—I only go by what one sees. We have to carry on our business in a way that will make it pay, and not so as to lose it.

4535. (*Mr. Harris.*) Your business is evidently rather a peculiar one?—It is a very peculiar one.

4536. Do you think that you would advise all young firms, if I may use the term, to exhibit with a view to pushing their trade?—Yes, I should.

4537. Rather in the way that you did?—Yes.

4538. You make a remark in your *précis* to the effect that many British manufacturers are very slow in moving?—Yes, they are.

4539. Do you think that that is consistent with your idea that you ought to have manufacturers on the committee in order to bustle things along?—No, I would make an exception in certain cases. Some of the slow-goers I would try to wake up; but then slow-going people are not the men, as a rule, who make an old business live at the present time.

4540. Do you not think that those men, in their own business, know their business pretty well, perhaps better than you and I do?—They do in some ways, but they are not willing to adapt themselves to to-day's experience and to-day's methods of business.

4541. Yet you would push them into an exhibition?—No, I would not push them, I would take the smartest men you could get.

4542. You would get the smartest men on to the

committee with a view of pushing the other men into exhibiting their goods?—Exactly.

4543. Do you think that would be a proper application of public money?—I did not look at it from that point of view.

4544. You are aware that as a rule the British Government has given certain grants for exhibitions?—Yes.

4545. It did at Paris?—Yes.

4546. Do you think it is right that the British Government should go on doing that in order to push traders who really ought to wake up of their own accord?—I think it might do good.

4547. To British trade generally?—Yes, I think it might. I can speak of the Paris Exhibition, because we exhibited there. The foreign exhibits in all trades were, in my opinion, very much better than our own exhibits. Of course, there was no one competing against ourselves, but I am talking now of silks and cottons, printed goods and machinery.

4548. Do you mean that you think that the foreign exhibits were better in quality than the British?—Both in quality and in quantity—most decidedly I do.

4549. Would you make a general statement to that effect?—Generally I would say so.

4550. Would you say that of machinery?—Yes, certainly of machinery.

4551. What nations, for instance, are you thinking of?—Germany.

4552. In the quality of her machinery?—Both in the quality and in the quantity. Her electrical machinery was a magnificent exhibit altogether, and so was Austria's. Then if you take silks, in fancy silks of all kinds we had a very poor show in comparison, both as to quality and size.

4553. Are you aware whether, for instance, that electrical machinery was all German made?—No, I could not say that.

4554. You did not inquire whether, perhaps, certain of the goods came from elsewhere?—If I had known this Committee was going to be appointed I might have made more inquiry, but I did not. I simply went there as a casual visitor. But there is no question about it that some of our old manufacturers want waking up. Take, for instance, Sheffield goods. I was talking to a Sheffield man some two or three years ago. Knives that they had been making for many years were being copied by the Americans and by the Germans, but of a cheaper quality; yet the people in Sheffield would not make them. The result was that that trade had to go, and it is very hard when you let a trade go to get it back again. You may afterwards adapt yourselves to the circumstances, and make that particular thing, but then you have got to kick somebody else out, and you cannot always kick those people out after they have been making a trade. You want to be first in the field.

4555. I suppose some of those manufacturers would have said, "We do not want to take up that class of manufacture"?—I do not know.

4556. (*Chairman.*) Are you sure that the duty in America is as high as you told me just now on bags?—It is 75 per cent. on cotton bags. We have not the slightest chance. I know as a fact that the Americans come here and sell in Liverpool to some of our own customers bags that they get 5½d. for—we will use that figure as a relative price—in America, but they dump them down here at 4½d.

4557. I gather that you would not go to America to try and push your trade there?—We cannot.

4558. You cannot do it?—No, we are absolutely out of it altogether.

4559. (*Chairman.*) Do you sell in Canada?—No, the Americans get into Canada.

4560. You have got a preferential tariff there?—But it does not make the slightest difference to us. The Canadians also make their own bags, and they make their own cotton—and they are growing it. We can get a little into South America, but not much.

4561. Not much into South America, do you say?—No, the Americans dump down there very strongly. Somehow or other, our Lancashire people cannot give us the quality that we want. The Americans use a better staple cotton altogether.

4562. (*Mr. Harris.*) Is it that the Lancashire people cannot or will not—referring to what you said just now?—It is due to both.

Mr. W. H. Feltham.

21 Mar. 1907.

4563-4. (*Mr. Waring.*) The trend of your observations just now seemed to be in the direction of the individual rather than on the matter which is before us of international exhibitions—I mean when you were speaking of the lethargy of the ordinary trader?—Yes.

4565. That is the difficulty?—It is the difficulty.

4566. And it is a great difficulty?—Yes.

4567. Of course our particular point is this question of international exhibitions, and I was going to ask you, Is it your point that a more commercial element on the committee which controls an exhibition of that kind would tend to infuse vigour into the organisation, and to initiate a policy that would react upon the traders themselves?—Most decidedly it would.

4568. That is how you would bring in the connection?—Yes, I would. I might emphasise that doubly; it is what we want. We go back to the old story of the red-tapeism. If you can do away with a great deal of the red-tapeism generally, we shall get on, I believe, much better. I do not want to be egotistical in saying "I this" and "I that," but I am only speaking from my own personal experience, and so I cannot help it. I took up this exhibition at Paris on my own responsibility; I carried the whole thing through from beginning to end, so I can only speak from that point of view.

4569. A further point is, Admitting this lethargy is in existence and that we are gradually getting ousted by other countries, that must reflect upon the nation in course of time, must it not?—It must do.

4570. Consequently it is the nation's duty to try to avoid it as much as possible?—Exactly.

4571. By contributing in the way of getting a smarter set of men into the control of matters, and bringing in all the help they can?—That is so.

4572. In England we pride ourselves rather on individuality, do we not?—Yes.

4573. And we have not in the past looked for assistance from the nation?—No. That is what you want to do, I think, more.

4574. Your point is, I think, that there is no need to make things worse by having lethargic commissions and committees as well?—Exactly. I take it that we want to take all these things up from a purely business point of view. Will it pay? No Government wants to give £30,000, £40,000, or £50,000 to a commission or an Exhibition Committee, unless there is going to be a reflection in the trade of the country afterwards.

4575. Or a try to beat it up?—Or a try to beat it up.

4576. Beat it into them in fact?—That is so. I think if you were to ask any of the exhibitors at Paris, they would say that the foreigners were very much better in any particular trade than we were. The exhibitors that I spoke to all had the same opinion.

4577. (*Mr. Malcolm Ramsay.*) Could you define more precisely what you mean by red-tape as regards exhibitions? I take it that one thing it means is delay?—Yes.

4578. Does that apply to the preliminary arrangements for collecting the exhibitors, or to the arrangements at the exhibition itself, or to both?—There seemed to me to be a fair amount of delay in getting the thing settled in the first place. As far as the exhibit itself was concerned, I do not think there was any fault to find at all.

4579. Do you mean that when you got there, you did not have any difficulty?—When we got there we did not find any delay. We sent our exhibit about a week or so beforehand. I arrived there on the Monday morning, I think it was, and there was my stall all taken out ready for me to proceed to work. I think exhibitors too often are themselves to blame, because they do not look after it personally. It is deputed to an agent, and he employs Tom, Dick, and Harry, and he has about twenty other things to look after, so he can only give just a glance here and a glance there, and it is rather left to the workmen to look after it.

4580. You think the red-tape came in more in the preliminary stages in collecting the exhibitors, than actually at the exhibition when the time came for showing the goods?—I do not think there was anything to complain of at the exhibition.

Mr. W. H. Feltham.

14 Mar. 1907.

4581. Of course, you are aware that the organising of an exhibition on the spot is rather a special trade?—It is, practically.

4582. It is a business of its own?—Almost.

4583. Therefore you might get a very smart committee of business men who would not know the ropes at all, as far as arranging the stands and managing the exhibitors and agents was concerned?—Yes, I quite agree with you there. As you say, it is almost a trade by itself; in fact, it grows upon you. It is an experience. You may fail once, but you will profit by that experience, and you will go on a different line next time.

4584. But as a technical job it needs to be done by a person who has been at exhibitions?—If it rested with me to have a say on that, I would say, get a man who is well experienced in exhibitions of all kinds to be one of the committee, so that you could have his opinion and experience.

4585. Taking the preliminary stages, do you think that you could get a committee of business men to give the time required to organise the thing?—Query.

4586. Is that not difficult?—It is a difficulty.

4587. I understand that by a business man you mean somebody who is actually engaged in trade?—And with a big business.

4588. If he had a big business to look after he would have keen competition to face?—Exactly.

4589. Could he afford to give up eighteen months of his time?—No, he could not do that, or else his business would give up him, one or the other.

4590. Is that not a great difficulty in the way of having a committee of business men in your sense?—It would be so, perhaps, but I would say that that might be remedied by getting them to meet together now and again.

4591. But as a matter of fact, is not that what has been done to some extent in the past? The Government have had a Commission, and they have had an executive officer who has not been a business man in your sense, because it meant three years' continuous work to organise the exhibition, to run it at the place, and to wind it up afterwards?—I can see your point.

4592. They have appointed a Royal Commission with a Chief Commissioner, and they have brought in a variety of people, some of whom, as far as I know, have had direct interest in large businesses?—Yes.

4593. Your point would, of course, be met by increasing the proportion of manufacturers who join the Committee?—Exactly.

4594. And by using them as a consultative body?—More as a Consulting Committee, if you could put it in that way, but not more as an actual working committee. I think that you would be remedying a fair amount in that way.

4595. Do you think it would be possible to get the real hard work of collecting the exhibitors and running the exhibition done by men who are actually in business?—I think a fair proportion of them would come forward.

4596. Would you be prepared to give up your time?—I would be prepared to give as much as I could.

4597. How much would that be?—It would depend on what I was called upon to do.

4598. Would you give a day a week—could you afford to do that?—No, I could not—not at the present time. When you have worked up a business from practically nothing, you have to keep on going for some years before it rests on an independent foundation. It is not an international exhibition, but we exhibit at the Bakers' and Grocers' Exhibition at the Agricultural Hall, which pays us undoubtedly, because we come in touch there with the very men that we want to come in touch with. It is a trade exhibition, and we come in personal touch with them, and we can talk to them.

5499. We probably will not differ as to the advantages of a trade exhibition, because that is a purely business thing, and it is confined to one article, and the visitors are people who want the goods that are going to be exhibited there?—Exactly. Here is one result of the Paris Exhibition. I met a city man some two or three years ago whom we had been dealing with and supplying for some two or three years before that—since just after the 1900 Exhibition. He said, "Mr. Feltham, perhaps you would like to know where we first saw your name?" I said, "I should, because I could never understand where you got hold of our name." He said, "At the Paris Exhibition; we happened to be over there, and we saw your name down from Tooley Street, and we said, 'We will go and see Mr. Feltham's exhibit'"—and they went, and I am taking orders from them to-day.

4600. Would you mind telling us whether you have a large bill for advertising generally in the year?—No, it is a very small one, under £25. I used to advertise very much more, but I found practically that the whole of it was thrown away.

4601. Do you do much with travellers?—I have one traveller. We have done more, and I myself have done a great deal of travelling. I have travelled all over the country. You can do more by personal application and speaking to people and writing them and letting them know that you are alive and that you want their business. That is the only way you can carry on a business like ours, where there is competition all the way round. If we were to employ 20 travellers I do not think we should do very much more. The personal element in our business has been principally, I believe, the success of it. But if you advertise in the trade journals your advertisement is among, perhaps, a dozen or twenty pages of advertisements, and people, as a rule do not go wandering over these pages of advertisements.

4602. (*Chairman.*) Do you not advertise in "The Miller"?—We have a little space, about an inch square, every week in "The Miller," and, I think that that is as good an advertisement as I have got. It costs me about 5 guineas a year.

4603. (*Mr. Malcolm Ramsay.*) How often would you be prepared to exhibit in a country where you had an opening, or thought you had one?—That would depend upon the distance.

4604. Would you say every three years?—I should think it would pay every three years. I would go over to Australia or New Zealand if I could go myself—that is, if I could be spared from my business for three or six months—if I could be absolutely out of it altogether, I should not hesitate five minutes about going.

4605. Are you quite prepared to do it even on the present basis?—I should be prepared to do so.

4606. Without any change in the organisation, would you?—No. Personally, I should want to feel that things were being carried out in rather a more businesslike way than they have been.

4607. Supposing there was a more businesslike way of doing things, but it cost you just as much in the future to exhibit as it has done in the past, would you go on exhibiting?—I believe it would pay me to do so.

4608. Without being relieved directly of any expenses, you think that with a proper organisation it would still pay you to exhibit?—It ought to pay really better, because, I believe, it would appeal more to business men generally.

4609. (*Mr. Harris.*) I gather that if you could have spared the time you very likely would have gone to New Zealand?—I should have gone, and I should not have hesitated about it. I am morally convinced that I should have been able to secure some rattling good orders—no question about it.

4610. (*Chairman.*) You have no partner, I suppose?—I have no partner.

FIFTEENTH DAY.

Thursday, 11th April 1907.

PRESENT:

Sir ALFRED E. BATEMAN, K.C.M.G. (*Chairman*).
Mr. A. WILSON FOX, C.B.
Mr. C. A. HARRIS, C.B., C.M.G.
Mr. ALGERNON LAW.
Mr. MALCOLM RAMSAY, C.B.
Sir ISIDORE SPIELMANN.
Mr. U. F. WINTOUR (*Secretary*).

Mr. DAVID HOWARD, called and examined.

4611. (*Chairman.*) I think you have been engaged a long time and in a large way as a wholesale manufacturing chemist, have you not?—I have been at it for fifty years.

4612. Your firm is a very old one, I believe?—It has been established for 108 years. I came into it nearly fifty-one years ago, as a boy.

4613. Your firm have exhibited at several large international exhibitions abroad, I understand?—Yes. We did not exhibit at the Paris Exhibition of 1889, and I think that is the only one of the large ones that we did not exhibit at.

4614. I see from your *précis* that you exhibited in London in 1851 and 1862, in Paris in 1855 and 1867, and then in London in 1885?—Yes.

4615. What exhibition was that; was it one of the South Kensington ones?—Yes, it was; but I forget exactly what it was called.

4616. You have also exhibited at Calcutta in 1884, at Paris again in 1900, and at St. Louis in 1904?—Yes.

4617. Then you say in your *précis* "etc."; what does that mean?—There have been some minor ones, at which we have exhibited.

4618. What is the nature of the goods that you exhibit?—They are pharmaceutical and other chemicals. I believe we are the oldest firm of quinine manufacturers. There is a French firm who have changed their name who are older; but we are the oldest who have kept on under the same name for all those years.

4619. Can you tell us whether you have had any increase in business in foreign countries which you can directly attribute to the exhibition of your goods?—I do not think that there is any increase of business that we can directly attribute to exhibitions. In reference to exhibitions in Paris and in America the tariff question prevents very immediate orders from those countries. Moreover, when one gets to the top of the tree, I suppose all we can hope for is to remain there; we cannot get much higher.

4620. You have a large foreign connection, I suppose?—Yes; and with the Colonies it is very large indeed.

4621. The French tariff is not so very high, I think, is it?—It is just enough to render it practically impossible for us to send anything into France; it just turns the scale. When we sell any goods in Paris it is almost invariably for export from Paris; they hardly ever pass the depôt.

4622. Have you ever experienced any actual disadvantage from exhibiting, through having your goods copied, and so on?—No, I do not think so at all. Chemicals are chemicals, and the only thing that one's competitors can do from the exhibition point of view is to make theirs as good in appearance. You may get a hint from others of new articles which they are exhibiting, but I think we get more than we give.

4623. You have different new ways of making up, surely, have you not?—The actual making up is not generally exhibited. The make-up of chemicals is a point that, as a rule, applies only to pharmacy; the dispenser may have showy ways of sending out his goods. With chemicals, as a rule, it is simply a question of purity, and the package is a very secondary matter.

4624. Do you attach any considerable value, as a means of developing your business, to the awards you have had at exhibitions?—I do. It is a very great advantage to be able to show that one keeps up one's old position, and that if we got the gold medal in London in 1862 we can get the *grand prix* at St. Louis in 1904.

4625. Do you attach copies of these medals to your trade circulars, and that sort of thing?—Yes, we always do.

4626. You have received a large number, I suppose?—I think, including the minor ones, we have ten or eleven, but the medals awarded at the exhibitions mentioned in the *précis* are the only ones we put on our billheads, and so forth.

4627. Have you ever been induced to buy from British or foreign manufacturers to any great extent, in consequence of having seen their goods at exhibitions?—To no extent, except in the case of machinery. For the machinery there is no doubt that a good exhibition is invaluable; you find forms of machinery there which you probably would not otherwise see.

4628. Machinery is what we should expect you to buy. You have found machinery to suit your purpose at those exhibitions then?—Yes; we have bought machinery solely because we saw it at an exhibition.

4629. Besides that, can you give us any definite points on which you have derived instruction or knowledge from visiting exhibitions?—My experience is that the most valuable information one gets is something a little outside one's own line. If you can learn what other people are doing in what seems a very different sort of work, you often learn a very great deal of your own work. To be enabled to keep up in a considerable measure with the progress of other manufacturers is always helpful in one's own work.

4630. Are you thinking now of things quite apart from chemicals and drugs?—Yes. For instance, a metallurgical furnace may teach one a good deal about a chemical furnace, and the machinery for a spinning mill may suggest forms of machinery for very different purposes.

4631. Then altogether your views on exhibitions are that they are helpful in a general way?—Yes, if they are good. An inferior exhibition, I am sure, does harm, and an inferior exhibit is a very great evil.

4632. I think you have usually exhibited at the important exhibitions, and that you have not often refrained from exhibiting at them?—That is so. In 1889 we were short-handed, and we deliberately did not exhibit then, because we were not sure of doing it well enough.

4633. Your not exhibiting then had nothing to do with the special features of that exhibition?—I do not know that our political feelings were particularly moved by the anniversary which that exhibition commemorated, but that would not have prevented our exhibiting.

4634. And your failure to exhibit, I presume, had nothing to do with the fact that the British Government did not take any part in it?—We decided not to

Mr. D. Howard.
11 April 1907

exhibit, and I really do not know what arrangements were or were not made. On that point I might say that I am quite certain it is not worth exhibiting at any exhibition where there is not joint action; and that means really Government action. The great point, and the one on which we would lay very great stress, is that if an English exhibit is to be really representative of the particular branch of trade which is in question, it must be, to make it effective, a joint exhibit—I mean that a number of manufacturers must agree together so that they shall make the English exhibit in that department an important one, and there must be so much joint action that they shall all have good exhibits. I think that means more or less Government management to get it together. I was not at St. Louis myself, but I heard all about it and worked very hard for it, and I believe the arrangements were most admirable. The chemical trade, largely owing to the Society of Chemical Industry, agreed that they would make a good exhibit.

4635. That was a collective exhibit?—It was a collective exhibit in this sense, that separate exhibits were placed all together.

4636. That is to say, the exhibits of separate firms?—Yes; the exhibits were not mixed. We combined together to make the English chemical exhibit a good one.

4637. And you were satisfied with the effect?—Everyone who was there said the effect was very good, and all that we have heard shows that the effect has been very good.

4638. Did you think that in other sections the British display there was good?—I did not go to St. Louis myself, and I never like to give evidence on what I do not know.

4639. Did you go to Paris in 1900?—No, I did not.

4640. Then you are not able to give us your experience of the other British exhibits at any quite recent exhibition?—No. The last one that I was at was the Paris Exhibition of 1867.

4641. As far as your own industry is concerned, you were well satisfied with the arrangements that were made at St. Louis, I gather?—Yes, they were very good.

4642. You say the Society of Chemical Industry got up a good exhibit; but you got all possible help, I hope, from the Government organisation?—Yes, the Government work was admirably done. It was that which enabled the Society to get our manufacturers to combine together; indeed, no society could have done the work without that unity which came from the co-ordination which the Government brought about.

4643. That brings me to this, that you think that in future large exhibitions there should be a Government Commission, or Government control in some form?—I am sure that that is the only way in which you can do it satisfactorily.

4644. You do not think that a committee of business men by themselves would do as well, then?—I think the ideal committee of business men would govern themselves; but my experience of men is that they are much better governed.

4645. You prefer to have a Royal Commission, with business men on it, I suppose?—I prefer a Royal Commission with business men on it, who can exercise a certain influence in keeping people together and keeping them in their place.

4646. How were you asked to exhibit? Did you receive a circular from the Commission?—I think the history was this. We had a circular, and we put it on the table; then we found that the matter was being taken up, and some of the business members of the Commission strongly urged us to come in to make a good exhibit of British manufactures, saying that it was rather a matter of patriotism. And so we went in for it; but we certainly should never have dreamt of going into it single-handed.

4647. Did it cost you much?—It is very difficult to say. It cost us some hundreds of pounds in actual cash out of pocket.

4648. Can you not give me a nearer figure than that?—No. It cost a great deal more, because it meant the time and thought of all our very best men, besides our own time and thought. It is a very serious matter to make a good exhibit.

4649. Did you have a representative at St. Louis all the time?—We have a representative in America, and he looked after the things. We had not anyone on the spot to explain the exhibit.

4650. Who was there on the spot looking after your exhibit—your agent? Who put up the exhibit for you?—Our American representatives, with the assistance of some of the English committee who were over there.

4651. Those were people from the Commission, I suppose?—Yes. The Americans have to buy things from us, though they do charge us a duty of 35 per cent.

4652. They do buy things of you there, do you say?—Yes; we do a good deal of business, in spite of the tariff, but, of course, that is only in very special things.

4653. They compete with you on the Continent a bit now, do they not?—I do not think they do in chemicals much, except in bromides, as they have cheap sources of bromine; but otherwise they do not.

4654. They require a good deal of bromide themselves, do they not, over there?—Yes, and unfortunately they make more than they want. I think that is the only thing in which we really have any competition from America.

4655. I suppose you have not considered the past organisation of the British sections at exhibitions, except as you came across them?—I think we have never taken part in the organisation of any of them.

4656. Has it occurred to you that it might be an advantage to have any permanent nucleus, from exhibition to exhibition, established in this country?—There the question is—how far is it possible to get a continuous succession of really first-rate exhibitions? If it was to keep up a constant number of rather periodic ones coming too often, the only result would be that it would be impossible for any leading firm to be permanently exhibiting—the expense is so great, and the trouble is so great.

4657. You have told us, I think, that you could not trace any direct benefit from exhibiting?—We could not trace any direct benefit from the actual exhibiting, but then I think that has a good deal to do, as I say, with the tariff. Moreover, chemicals are not very attractive things, and no one would buy chemicals merely for the look of them.

4658. So that you have exhibited partly for the general prestige of the country, I suppose?—For the general prestige of the country, and I would say for our own prestige; one must keep one's position.

4659. Are there new firms in your industry constantly coming on?—Constantly.

4660. From your knowledge, do they generally exhibit?—If it was a very important exhibition, and they exhibited and we did not, that might tend to give the impression that we had fallen out of the race.

4661. But you do not want exhibitions to be too frequent?—No. In the first place, there is no very great novelty in our line of business constantly coming up, and then what you exhibit is rather the general character of your chemicals. A new chemical substance may be invented, but the mere sight of it will not even suggest its use, still less its name. The question of introducing novelties in chemistry is purely a question of literature.

4662. You introduce your novelties through doctors, do you not?—I do not know. That is a very wide subject.

4663. It is, and we will not go into it deeply?—We are at a great disadvantage in England in introducing novelties, firstly, owing to the fact that we may not try limited experiments on animals, and, secondly, *pace* the German doctors, our doctors are very scrupulous about trying experiments on human beings.

4664. Do you mean to say they are too scrupulous, or very scrupulous?—They are very scrupulous. I do not say too scrupulous.

4665. Do you think that in that way there is a danger of our getting behind other nations in the use of new chemicals or new drugs?—In the use of new medicinal chemicals undoubtedly. We follow their lead. Whether we are the worse for not doing otherwise, I would not venture to say; that I must leave to a doctor to say.

4666. I want rather to get out of you whether your goods are not in a somewhat different position to many things that are exhibited at exhibitions?—They are exceedingly different. New machinery, or, taking, for

example, the textile trades, new patterns and new styles, appeal to the eye so immediately.

4667. If a new drug is invented you would not show that at an exhibition, would you?—Certainly not, because it would certainly be patented, and we should not make it.

4668. You would get certain doctors to try it as far as possible, I suppose?—Yes, that is the way it is done, and then, as I say, English doctors do not like it; they are very careful.

4669. You would send a new drug on to the doctors, I suppose?—Yes, and we can get a medical opinion about it where there is not the smallest risk. A doctor will try a new salt of quinine very willingly, because he could not do any great harm with it.

4670. I suppose you are aware that American chemists send a great deal in that way to English doctors for experiments?—I know; and they send it with a great deal of literature, too.

4671. But you do not do that so much?—No, we do not. I am afraid my conscience would not allow me to issue some of those things.

4672. But anyhow, you have got a certain amount of advertisement from these exhibitions?—Yes.

4673. But the exhibit has been an exhibit of known drugs?—Yes. We have given people the idea, which I do not think is unfairly given, that we are in the front rank, and that we can make at least as good things as other people.

4674. (*Mr. Harris.*) I rather gather from your statement to the Chairman that you look upon the collective exhibit as the perfect form of exhibit; will you tell me when you first joined in a collective exhibit at these exhibitions?—If I remember aright, in 1867 there was a somewhat vague attempt made at a collective exhibit.

4675. So far back as that?—Yes; that is to say, all the cases of the English chemists were made of one pattern—there was about that much combination. But there was no effort made to ensure that all the leading firms were exhibiting; that was just left to whether they chose to come in or not.

4676. So you did exhibit in that year in Paris really on your own basis?—There were Commissioners appointed, and they were exceedingly helpful, but there was not that combination among the exhibitors that there has been since.

4677. Now take the Calcutta Exhibition of 1884; was there any more combination in that case?—I do not think there was. As that is one of our best markets, we did not much want anybody else; we were quite content to go on our own there.

4678. Have you gone to any of the Colonies? Did you think, for instance, of going to the present exhibition in New Zealand?—I do not think we have sent anything, but I am not quite sure. We have not unfrequently sent goods to Colonial exhibitions through some leading merchant who is making an exhibit. That is very common. Some leading importer will exhibit a number of goods, and ours among them.

4679. You told the Chairman that as regards the St. Louis Exhibition what you have heard of the exhibit was very good. Did you form any opinion as to the general effect of that upon the chemical trade of this country?—It is very difficult to answer that question definitely. My own opinion—and it is only my own opinion, nothing better—is that it was a distinct benefit to the chemical trade to have been well represented, and that it would have been a considerable damage if it had not been well represented.

4680. That was the occasion when Sir Boverton Redwood was taking an active part in it?—Yes. He took a very leading part, and a very good and able part too. That exhibition probably influenced the Canadian buyers. One cannot exactly trace it, but I am quite certain, knowing what we do now, that if the English manufacturers had not exhibited at St. Louis, and had not done it well, the Canadians would have got the impression that we were behindhand, and so possibly would the South Americans.

4681. Are we to understand from what you said just now that, having once joined in such an exhibit as that, you would not go into an exhibition on your own now?—Unless it was something very exceptional.

4682. Unless you had another Calcutta one?—Calcutta I should have to go to. Really, in a very great exhibition a mere individual exhibit is lost, unless you can combine together so that the whole exhibit is worth looking at.

4683. That would be particularly true of chemicals, I suppose?—Yes, especially so. Unless you can somehow or other attract attention you are lost.

4684. Do you look upon exhibitions generally as things to be encouraged from the point of view merely of education, or also from the point of view of the benefit to the nation's trade?—There one must not look too much to one's own particular industry. I do not think the educational influence of chemical exhibits is much. By the time a student understands enough to understand a chemical exhibit he can educate himself without the help of the exhibition.

4685. I was looking at education in its broader sense?—It is only the business I do that I look to, of course. The educational effect of exhibitions of machinery, to take the extreme, is undoubtedly very great; it is not merely that you see a particular machine which fulfils your particular needs, but you get a general knowledge of what machinery is doing, which often is worth more than the particular machine.

4686. Would you say it is worth more to the individuals of the nation than to the nation as a whole?—Yes, it is worth more to the individuals of the nation—to the thinking ones, at any rate. By an exhibition you learn the general progress more easily than you can possibly learn it in any other way—in machinery especially.

4687. Take your own more particular products; do you still think that the general reaction upon the good of the nation is sufficient to justify the expenditure of Government funds in helping you to exhibit?—I should say that at St. Louis it was, speaking from the general point of view; but unless it is an important exhibition, and unless it is well done, it is not. To encourage an exhibition is a thing I should be rather afraid of.

4688. (*Mr. Malcolm Ramsay.*) Could you tell us more definitely at what intervals you would be prepared to go to a first-class exhibition. Would you consider an interval of five years or ten years sufficient?—I should say five years would be more frequent than I should at all wish to have to do that. Ten years would be a not unreasonable interval, because then you have time for the previous work to be forgotten rather. I am speaking of my own line of business; of course, engineers must speak about their line.

4689. Did you think of going to the smaller Continental exhibitions which were held between 1867 and 1900—say the exhibition at Brussels in 1897, or the exhibition at Antwerp in 1894?—No. There I confess, we had no particular feeling of patriotism, and the Belgian market does not happen to suit us. Had we had a large *clientèle* in Belgium, it would have made the whole difference. It was simply a question of £ s. d.

4690. (*Chairman.*) The Belgian duties are not high, are they?—No; but Belgium is the dumping-ground of every chemist who has anything to sell. I would not say we never did it ourselves.

4691. (*Mr. Malcolm Ramsay.*) I should like to ask you a little more about your view of the part Government should play in connection with exhibitions. Do I rightly understand that you consider the most important point is organisation and co-ordination?—If I may judge—and now I do not pretend to speak as an expert; I merely speak from my own experience—if the Government can regulate and utilise and bring together the mercantile knowledge of individuals, that would be an invaluable help; on the other hand, if it does much more than that, if those who are not in business try to regulate business matters, it does not succeed.

4692. Would you consider that the Government should exercise a right of selection as between manufacturers, and reject certain exhibits and take others?—I am afraid I should be inclined to be governed by my own chances of being in, when considering that question. I think officials should have the power to reject a palpably and unreasonably poor exhibit, or to reject an exhibit which is a flagrant case of puffing an unworthy novelty; but I do not think their power of rejection should go much further than that.

4693. I thought you said just now that unless an exhibit was first-rate, it was better not to have it?—I think the exhibit being first-rate depends upon getting

Mr. D. Howard.

11 April 1907.

such a combination among the leading firms that it must be first-rate.

4694. Would you as an exhibitor expect or as a taxpayer think it right, that Government should give you any direct financial help towards your exhibit?—I do not think the Government ought to give an individual firm financial help.

4695. I am thinking of the individual firm?—I think the Government—if I may venture to express an opinion about what I do not understand—might very well bear the expenses of organisation; but I do not think the Government ought to pay the expenses of the exhibitor.

4696. (*Sir Isidore Spielmann.*) You referred just now to the difficulty you have in introducing new drugs to the market, especially through doctors. I suppose that remark applies to all other firms in the same trade?—Yes, it applies to everybody in England.

4697. I take it that by participating in an international exhibition you practically rely, or in a great measure you rely, on that way of introducing you new drugs?—We have very few new drugs, and we never sell anything under an assumed name. If an article not patented is asked for, if it will pay we can make it. But the particular art of introducing new medicines depends chiefly upon a name which expresses nothing—I believe that is essential for a proprietary name, and if it is neither good Latin nor good Greek, so much the better. That all links in with these experiments on animals and on human beings, and on arrangements with doctors, and on other things which—I do not know if I ought to say it—I think it is very much to the honour of the English medical man that he has very little to do with.

4698. But still, by these international exhibitions you are able to introduce a drug to the attention of the international jury, and you rely upon the jury to give you a valuable opinion in the shape of a high award?—We have never introduced a new drug; that is a thing we have never done. I do not think it is the business of the manufacturing chemist to do it. It is the business of the doctor to ask for what he wants, and if he asks for it he shall have it, provided it is not patented.

4699. But you do attach importance to the awards you get, do you not?—Yes, but I think the awards relate to the quality of the manufacture. Certainly our awards were not for any special novelty, but for the general quality of manufacture.

4700. What awards did you take at the St. Louis Exhibition?—The grand prix.

4701. Do you advertise that fact?—Yes.

4702. That is a distinct advantage to you, I suppose?—Undoubtedly.

4703. If you had not participated in the St. Louis Exhibition, and another competing firm had taken the grand prix, I suppose that would have done you injury in your business?—I think it would. It was an exhibition of sufficient importance for people to notice the absence of an exhibitor. Might I say it is exceedingly important that in our case the jury should be men of rather special knowledge—apart from their being men of the highest character. That is a point on which I certainly think the independence of the Government officials is very important; they can judge whether the names recommended to them on the evidence given are the names of men whose awards will carry weight.

4704. At the exhibitions you have mentioned here, I think the organisation has been, in most cases, under Royal Commissions?—Yes, I think it always has.

4705. Have you ever exhibited under the organisation of the London Chamber of Commerce?—We have never exhibited at any of the exhibitions where there was not a Royal Commission, so far as I know, except it be Calcutta or some of these minor exhibitions which I have not put down in my *précis*. I do not remember about Calcutta.

4706. (*Mr. Algernon Law.*) Did you exhibit at Milan?—No, we did not. We consulted our Italian agents, and they said that pharmacy was not arts or science. I think that is as near as I can give you what our agents said.

4707. (*Mr. Wilson Fox.*) Do you show apparatus and plant in addition to chemicals?—No, we do not.

4708. I see in your *précis* you say, "The only immediate influence of exhibitions on our purchases has generally been in the matter of apparatus and plant"?—It is active, not passive there.

4709. Therefore you have rather spent money on going to exhibitions than got any back?—As far as the immediate result goes, yes. There is no doubt it has cost us a lot of money.

4710. But you could have bought apparatus and plant without showing your own goods, could you not?—If we had been visitors we might have done all that.

4711. Your exhibits, I suppose, are really only interesting to experts?—Absolutely so. Questions of purity were gone into very carefully by the jurors. They experimented and had independent tests, and they took infinite pains. Take what is certainly the oldest thing which we are well known for, that is quinine. If you were to exhibit it in this sun for a week it would become brown. Therefore the mere appearance of a chemical does not tempt people.

4712. That being so, would you say that the members of the trade with which you are associated are on the whole not likely to come forward to exhibit their manufactures very frequently?—I think they will all feel, as I do, that there is nothing much to be gained by that.

4713. Would you also find that it would be difficult to get many of them to exhibit? I have heard what you have said, and I know your opinion; would that be the opinion of your fellow-manufacturers?—Having done a good deal to put pressure on other manufacturers to exhibit at St. Louis, I know that a great many of them—and some of the best—were very loth indeed. They wanted a good deal of pressure to be got to exhibit at all.

4714. That is exactly what I wanted to get from you, because you rather suggested that for the good of the country, and from motives of patriotism, manufacturers situated as you are may be induced to exhibit, and that not from the business point of view as far as you are aware?—Except in that way as showing they were keeping at the top.

4715. Do I understand that to any extent you show with the object of increasing or maintaining an export trade?—Our export trade is what we are most anxious about, because England is pretty well saturated with at least as much medicine as is good for it—perhaps more.

4716. And the doctors are more enterprising abroad, I understand?—In new countries there is always a chance of turning somebody else out.

4717. In what other way besides exhibitions do you bring your goods to the notice of foreign countries? Do you employ travellers?—We employ agents.

4718. Are the agents fixed in certain places, or are they men who travel in any way?—We have tried travellers, but on the whole a really good agent who knows all the buyers is better than a traveller.

4719. I do not want to ask you to tell us any secrets about your business, but do you have many agents abroad?—We have agents in India, we have agents in Italy, we have agents in Canada, and we have agents in Constantinople; then we have men who are our special correspondents—I do not know whether you would dignify them with the name of agents—in a dozen other places.

4720. I have asked that question in order to ask another: Do you show in countries where you already have agents?—Yes, I should say rather where we have agents than where we have not.

4721. Why is that?—It helps the agent. We did not show in Italy because our agent said he did not think it would help him. That was the only reason we had.

4722. (*Mr. Harris.*) In referring to the jury just now, did I understand you rightly to suggest that if they were officials you could rely upon them better?—I am afraid I did not make myself clear. I was referring to an official selection of the jury—that is to say, not merely a committee appointing themselves, but that the Government Commission should exercise a wise discretion as to whom they would take on the jury.

4723. The jury is usually appointed, is it not, by the Commission of the country in which the exhibition is held?—I am not sure. I have known jurors, but I was never one, so I do not know exactly how they are appointed.

4724. Your suggestion is, then, that you would like to have a certain official control, in order to ensure sound jurymen being selected?—Yes, because it wants a very judicial mind to perform their duties properly.

4725. (*Chairman.*) I suppose there would be a difficulty from time to time in getting jurors for your manufacturers who are not competitors?—A juror is *hors concours*, and that is as good as getting a prize.

4726. (*Mr. Algernon Law.*) Were those who were reluctant to exhibit at St. Louis converted to the practice by their experience? Did you hear anything from them afterwards?—I heard no dissatisfaction with the particular firms I am thinking of who got the *grand prix*.

4727. (*Sir Isidore Spielmann.*) You are strongly in favour of collective exhibits, I gather?—Very strongly.

4728. Would you equally participate, on your own account, if they were not collective?—It would want a very strong case to make us exhibit at all if it were not a collective exhibit. If chemical manufacturers did not go in all together, we should not go in by ourselves.

4729. (*Mr. Wilson Fox.*) In your particular industry it would be very difficult to get up a good exhibit unless it were a collective exhibit, I understand?—It is infinitely more interesting when you have a good collective exhibit.

4730. Among your people it would be very difficult to get up a representative show without the exhibit being collective, would it not; and without some pressure being brought to bear upon the leading men in the trade to show?—It would be apt to degenerate into a number of interesting exhibits of new things and new firms, but not sufficiently telling to create much attention or to get people to come to look at them.

4731. (*Chairman.*) Should you object to patent medicines, like Pink Pills for Pale People, being exhibited in your collective exhibit?—I should object to it extremely, because I am thankful to say we have never sold anything under a name that did not describe it.

4732. You were not at St. Louis, and therefore you do not know whether such patent exhibits as Pink Pills and so on, were exhibited in the chemical section?—If they were, the members of the committee who induced us to go kept it very secret. I do not think they were.

4733. Was it understood that there should not be that class of exhibit?—Most distinctly. That is not chemistry. *Mr. D Howard.* 11 April 1907.

4734. (*Mr. Malcolm Ramsay.*) You were speaking just now about the part that business men should take in the organisation, and I understood you to think that they might be associated with the Royal Commission rather in an advisory capacity; is that so?—I do not quite know how it was worked at St. Louis, but it was worked very well there.

4735. There might be particular points referred to them, and they might attend occasional meetings of the Commission; would that be so?—I can only say that it certainly worked very well at St. Louis.

4736. (*Mr. Harris.*) So you think St. Louis was a counsel of perfection?—I do not say quite that, but it was exceedingly good.

4737. (*Mr. Malcolm Ramsay.*) I suppose the ordinary business man, by which I mean a man who is actively engaged in looking after a business of his own, has not much time to spare for taking an active part in organising an exhibition?—In proportion as he is worth having in his own business, it is difficult to get anyone else to replace him; and therefore it is, I suppose, that he is wanted everywhere else.

4738. (*Chairman.*) We have had from several witnesses their opinion as to whether they prefer exhibiting by classes or by countries; would it make any difference to you whether you had your exhibit in contiguity with similar goods from other countries, or whether you had it in one great British section?—Personally, I should not in the least mind being pitted against a foreigner, either as a class or as a country; but I think from the point of view of general business it is better to keep the countries separate.

4739. And you would like to keep the countries separate?—I think so. I think it creates more interest, and it puts in a rather wider rivalry, which is a good thing.

4740. You would be in favour of having a great exhibit for the whole of a country?—Yes.

Mr. Francis A. Darton, called and examined.

4741. (*Chairman.*) What is the name of your firm?—F. Darton and Co. *Mr. F. A. Darton.*

4742. Do you carry on business in London?—Yes.

4743. What is your business?—Scientific instrument makers.

4744. You have exhibited at several great exhibitions in recent years, I understand?—Yes.

4745. When did you exhibit in Paris—in 1900?—No, not in 1900. I think it was in 1878; at any rate, it was at the time when Sir Philip Cunliffe Owen was the British Commissioner.

4746. Then you exhibited at Chicago in 1893?—Yes, and I was there all the time.

4747. At Brussels in 1897, at St. Louis in 1904, at Liège in 1905, and at Milan last year?—Yes.

4748. The goods that you exhibited were chiefly self-recording barometers and thermometers, aneroid and mercurial barometers, clinical and other thermometers, microscopes, electric motors and dynamos, levels, compasses, clinometers, and specific gravity instruments?—Yes.

4749. Have you had any increase of business in foreign countries which you can attribute to exhibiting?—Yes, I have had some, certainly. In the case of the American exhibition some departments of the American Government bought of me.

4750. Can you trace any increase of business from Milan?—From Milan I have had a few small orders, but very few as yet.

4751. Have you suffered any disadvantage from having the goods that you have exhibited at exhibitions copied?—No, I do not think I have had any cause to complain on that score.

4752. Do you attach value, as a means of developing your business, to the awards that you have had at exhibitions?—Yes, certainly.

4753. You have had high awards, I suppose?—Yes. It does not matter how good your stuff is—I am speaking of manufacturers now—but unless you get some awards you never get to the front in our line.

4754. Have you been induced to buy anything that has been of use to you by seeing it at an exhibition?—Yes, I have. When I have seen instruments that have interested me I have ordered samples of them.

4755. Are there any other points in which you have derived instruction in matters of manufacture?—Yes, certainly.

4756. You have refrained, you say from exhibiting at several exhibitions of late years; the Paris Exhibition of 1900, for instance?—In that case I applied for space, and they told me that they had no room.

4757. Was that a case of applying too late?—No, I applied in very good time.

4758. Did you want a great deal of room?—No.

4759. You have got no very large machinery or anything like that to exhibit, have you?—No. My instruments are not large instruments; they are more self-recording barometers and things of that sort.

4760. About what space would you want?—I could do with a space about as big as the window of this room. When I exhibited at Chicago I had a much larger space. I had two cases with a centre-case outside a small room. But that is not a necessity for me when exhibiting, and at the last exhibition, at Milan, I only sent half that amount.

4761. Have you found exhibiting to be expensive?——Milan was one of the cheapest exhibitions I have been at. Chicago was a miserable fiasco as regards expenses; it cost me a lot of money.

4762. Why was it so expensive?—It was expensive to get the goods out there, and then American labour is a good deal dearer than English labour. At the end of the exhibition we were waiting some weeks to get our things through the Customs, and getting our packing-cases in. Before that occurred they cut off all our water supply and all our light, and as it was quite six inches deep in snow it was dangerous to work in the

Mr. F. A. Darton.

11 April 1907

building at that time putting our goods away, because the snow broke in the roof, and large sheets of glass came down occasionally.

4763. Was that the fault of the organisation?—The American buildings were very rough in comparison with European buildings. It was beautifully designed, but the interiors of the exhibition buildings were left as rough as they possibly could be. I had several of my best thermometers spoilt by the heat there. I took out some very delicate standard thermometers, and the heat in the gallery where we were placed was so tremendous that it burst them.

4764. It was very hot in Chicago, I remember, at that time?—Yes. We knew that was coming, but unfortunately when we complained about it, we got nothing seen to. They put the blinds on the other side of the Manufacturers' Building, where they were not wanted; and I had eventually—it was so very hot—to take out one or two of the sheets of glass myself in the large windows, and to rig up a ventilator to let a little air in.

4765. Did you complain to the British Commission about it?—Yes, I complained until I was tired.

4766. But they could not do anything for you?—They neglected us to a great extent all the way through.

4767. What was your experience at St. Louis; was that better?—I did not go to St. Louis. That was entrusted to the Government. They got me to send a few instruments, and they took all the onus upon themselves; they even sent a gentleman round, experienced in scientific matters, to coach himself up as to our exhibits.

4768. From whom did he come?—He came from the British Commission.

4769. From the Royal Commission, do you mean?—Yes. He was a man who was well up to his work, too; he was an intelligent man.

4770. You found that better?—Much better. I can assure you. I noticed that in a marked degree among the French and Germans, even in Chicago. They had that system right through, and it is the proper system, in my opinion, for running exhibitions. They were all united together. When I was there I met a man in the German scientific section whom I know well—he was a German manufacturer of induction coils. He was deputed by the German Government to take charge of the whole of the scientific section, and if a gentleman wanted to inquire about any particular exhibit, he walked up to this man, and this man found him all the catalogues and gave him all the necessary explanations about it, and understood what he was talking about.

4771. He, in fact, represented the exhibitors to a great extent?—Yes, and he represented himself also; but he was paid by the German Government.

4772. So he represented the German Government?—He was appointed by the German Government at a salary. I do not suppose in a case of that sort that it cost very much, because he would have been only too anxious to go out to show his own stuff.

4773. He was one of the exhibitors, was he?—He was one of the exhibitors as well.

4774. Your trade did not send a collective exhibit, did it?—No.

4775. You did not join with other firms?—No, but all the scientific instrument makers were in the gallery. There were only four of us exhibiting.

4776. So that your manufacturers were together, and side by side?—They were close to each other. You can understand that to be in a gallery in that particular position was about the worst position that a scientific instrument maker could go to. The Swiss had all their scientific instruments on the ground floor. Their exhibit was the centre of attraction, and I may say that practically the whole of their scientific exhibits were sold. The Swiss manufacturers reaped enormous benefits by having them all in that central portion of the building. The principal part of our British exhibits on the ground floor was taken up mainly by such people as pipe manufacturers and soap manufacturers and somebody's patent scents. I think they held us up to ridicule. I know the other nations were laughing at it, to think that this was a specimen of what Englishmen made.

4777. (*Mr. Wilson Fox.*) In fact, it was badly managed?—It was. It seemed a kind of gigantic advertisement. What is there in a soap, what is there in scent, and in all those sort of things? That does not appeal to any scientific or educated man.

4778. (*Chairman.*) Your point is that your instruments were put in a position quite unfitted for them owing to the temperature?—Yes. I spoke to Sir Henry Trueman Wood about it, and he quite agreed with me. He said: "I quite see you did not come hundreds of miles on purpose to be placed up in this poky corner." He went down and spoke to Mr. Lloyd about it, but Mr. Lloyd vetoed it immediately.

4779. That is, he would not make any change?—No, he would not.

4780. Who was the head of the British Commission at that time?—Sir Henry Trueman Wood.

4781. And he was vetoed, you say, by Mr. Lloyd?—He did not take any active part in it really; in fact, I did not see him a dozen times the whole time I was there. He is a very scientific man, and he is well up in science; but then a man may be a scientific man and have no business capacity.

4782. That was at Chicago; but you did not hear of anything of that sort at St. Louis, I think?—No.

4783. The St. Louis Exhibition was much better managed?—I think it was. Everyone I spoke to seemed well satisfied, or, at any rate, better satisfied with the results there.

4784. Do you think that a Royal Commission should manage these exhibitions?—I think it would be very much better if it did. I suppose you see quite as well as I do that in arranging a business of that description it is very difficult to pick good men to take on twelve months' work.

4785. You mean people from the outside who have not had work of that kind before?—Yes. It is like a business; you get all the people that are not much good. I think probably that had you had some good business man from some of our permanent Government Departments it would have been well worth while to have spared him for the twelve months.

4786. You seem to be rather in favour of having a small permanent nucleus between exhibition and exhibition?—Something of that kind, I think, there should be. Another thing you want is that the Commissioner himself should be a man with a good deal of tact. You can easily offend foreign susceptibilities if you are not very careful how you handle them. We felt it so much out at Chicago that we exhibitors on our own account gave the Colonial Commissioners a smoking concert. We formed a British Exhibitors' Club there, and I was the treasurer. We held it in the Manufacturers' Building; and we invited the Commissioners from Australia, New Zealand, and Canada all up one night at our own expense, and gave them a little entertainment. I think that sort of thing helps towards friendly feeling. I think one of the most satisfactory exhibitions I ever exhibited at for its size was the Brussels Exhibition.

4787. That was in 1897?—Yes. That was well managed.

4788. It was well managed, you say?—Yes, capitally. They had not any too much staff, but they had just sufficient staff to do the thing properly. When the Lord Mayor went round, they were so short of hands that I took charge of the British Commission offices and looked after the mace and all the rest while they went parading round. We had only two big City policemen, who were very tactful men, and a few sailors in British uniform. It was managed economically and well. I will tell you what Mr. Dredge did, which I think was a very good thing. A lot of the English jury were there some time before; they were personal friends of his, and they went round with the French jury to explain the beauties of some of the instruments exhibited.

4789. You are speaking now of the international jury?—Yes. They really pulled them a good deal by the nose—I am only speaking as an exhibitor. In Milan lately the German Government almost held a pistol at the heads of the exhibition authorities, and told them that they expected such and such awards for the different exhibitors, and they got them.

4790. Have you not been properly treated in regard to awards?—Yes. I do not say anything about that, and I am not speaking about that. As far as I know I think I have been served very well.

4791. What awards did you get at the Chicago Exhibition, which we have heard so much about?—At

Chicago I got five of the highest awards. They only gave bronze medals there, and I got them in five different sections. A curious thing happened at Brussels. I got the *grand prix*.

4792. Why was that curious?—I was going to tell you. When the report came down, Mr. Dredge showed it to me as an exhibitor, and said "You will like to see it, Mr. Darton; you have won the *grand prix*." Twenty-four hours afterwards I got notice that I had not received the *grand prix*, but that I had received two gold medals, and Ross, of Bond Street, had got the *grand prix*. Ross had an agent on the spot—some lace agent, or something like that, acted as his agent—and there is no doubt got at the other jury over it. Mr. Dredge tried to fight it, but they would not re-open the subject. I have got the list sent down from the jury somewhere to-day, where my name is in print as receiver of the *grand prix*.

4793. That is not a question of the Germans, or any other nation, taking your *grand prix*, because it was given to somebody else of your own nationality?—Yes. That was through no fault on the part of our representatives; it was the fault of the jury.

4794. (*Sir Isidore Spielmann.*) You do not think it was a printer's error, do you?—No. I knew Mr. Dredge very well, and as the British Commissioner he came to me and said, "I am very glad to congratulate you, Mr. Darton, you have got the *grand prix*." He said, "I will send you down the report which I have just received from the international jury." It was a printed book with my name in it.

4795. (*Chairman.*) On the general question of organisation, you are in favour of a Royal Commission with business men on it, I suppose?—I think so. That would be the way to do it. If properly done, I think you could economise, at any rate you would not waste much money. Another thing you would have to look forward to is that when you take a man on temporarily for these sort of jobs, it is that man's interest, if he is an employee, to hang on as long as he can. Look at the St. Louis Exhibition; they were down in Westminster here for months and months after the thing was finished. An ordinary business man would say, "Now, I will clear this matter up, and we will get the thing through as soon as possible."

4796. In fact, you think that Commission was carried on longer than it should have been?—That was my idea. I think all these things should be managed in a businesslike way. I look at it as a business man. If I were running it as a part of my own business I would not allow it, and I do not think we ought to allow it in Government affairs.

4797. How often are you prepared to have these big exhibitions, and to take part in them?—I do not believe in having too many. Personally I think that when they began to give annual exhibitions over here it simmered down to nothing at all. When they had the great exhibitions, they certainly carried much more weight than the annual exhibitions they had for some years over here.

4798. Do you think once in five years would be enough?—I think once in 10 or 11 years is enough. I do not believe in having them so often.

4799. Would you still have your permanent organisation going on?—In a matter of that sort, is there not some Department of the Government from which they could detach certain men that they knew were good business men and men of business capacity filling their places temporarily while they were away?

4800. That is what I want to get from you: you think that could possibly be done from some Government office?—Yes, I think so. I will tell you where we found woeful trouble always in exhibitions—that is, in getting your goods. At Paris in 1878 two of us, myself and a man, were there for over a week trying to find our cases. We ought to have been back here before that.

4801. (*Mr. Malcolm Ramsay.*) Do you mean the packing-cases containing your goods?—Yes.

4802. (*Chairman.*) That is 30 years ago; could you give us any more recent instance?—Even in Chicago it was the same. I had to go myself to find my cases. I got no help from our own Commission. I was referred to different men—"Go to so-and-so; go to so-and-so." The exhibition ground at Chicago was miles across, and you got rather disgusted with that. After it had been on for about a week, I set to work and went up to Mr. George, the Secretary of the American Commission of Liberal Arts. He was a Scotsman, and a very smart man. He said, "I am very sorry your goods have not turned up; if you come up to me to-morrow morning at 10 o'clock I won't leave you till I have found them"—and he did find them. I went up to him at 10 o'clock the next morning, and they were on my stand in less than an hour—the whole lot.

Mr. F. A. Darton.

11 April 1907.

4803. Had you paid for the transport of those goods?—The American Commissioner saw to that, when they once arrived. I paid for the transport of my goods over to America right up to the Exhibition.

4804. You had paid for them up to the Exhibition?—Yes.

4805. What else did you pay for?—I paid for their return, and I paid for the Customs business; we had to get clear of the Customs.

4806. You did not pay Customs duties, did you?—I took some out that I had to pay duty on.

4807. You paid duty on what you sold?—Yes, I paid 60 per cent.

4808. But you did not pay duty on all that you took?—No, except this, that there were some expenses in the Customs in clearing them out. After the Exhibition was shut up, I was up at that office about a fortnight getting my goods through, going about from pillar to post.

4809. (*Mr. Wilson Fox.*) I suppose if these international exhibitions were held often, exhibitors here would cease sending out such good exhibits, or at any rate they would not take the trouble to get up such a good exhibit every year as they would every 10 years, say?—I am sure of that. Your mind cannot keep pace with it.

4810. Therefore if annual or biennial exhibitions took place, in which Great Britain participated, you would get an inferior class of British exhibits shown?—Yes.

4811. Which would do perhaps some damage to British credit abroad?—I think so.

4812. Apart from exhibitions, how do you push your trade abroad—what steps do you take?—Mostly by price lists mailed to different firms abroad.

4813. By sending price lists to individuals?—To people who we know will use our stuff. We are wholesale people.

4814. By sending price lists to individual retail people on the Continent?—Yes.

4815. I do not mean to private individual purchasers, but to retail traders?—To shopkeepers, traders, and people of that sort.

4816. Do you not use travellers or agents?—Yes. We travel in Belgium and some parts of France, and I am going to send a man off at the end of this week to Switzerland.

4817. Do you select particular countries?—I do not select any special countries. I know pretty well where my goods go. I see that when I am abroad myself. When I am on the Continent, I always keep my eyes open to see what is going on, and if I think a thing is likely to take over there, and it is of English make, I can soon put some in.

4818. You have sent your goods twice to American exhibitions, I understand?—Yes.

4819. You were not afraid of the tariff there?—No, and I will tell you why. We are in a very fortunate position. It is probably not known to most people, but we scientific-instrument makers have a certain advantage there. If, for instance, I make a very high-class instrument, say a standard barometer, or anything of that sort, a professor at an American scientific institution can order one from me, and he can go before a magistrate and take his affidavit to the effect that it is for scientific purposes, and then he gets it in duty free. That makes a considerable difference.

4820. (*Chairman.*) Are there many institutions that can do that?—It is done all over the United States; it is in connection with education.

4821. (*Mr. Wilson Fox.*) Were a good many of your things sold to institutions?—Yes. Professor Hoag bought several of me for the Geological Survey.

4822. Is this sale to institutions the main reason why you were able to show in America?—Yes. The Americans like English work, and a scientific institution which can get its goods in duty free makes a point of getting English instruments. You find all the professors, when they come across here, are going

Mr. F. A. Darton.

11 April 1907.

round the different centres of science to find out anything new.

4823. Apart from that sale to these scientific institutions, do you find that exhibiting in America did you any good in pushing your trade there?—It has.

4824. Notwithstanding the tariff?—Notwithstanding the tariff; but the tariff, no doubt, is extremely injurious to us.

4825. Still, it is worth your while to show and send goods there?—Yes.

4826. Is it a costly thing to send your goods to an exhibition?—Yes.

4827. I understood that your exhibit was rather a small one in size?—It is small, but the instruments are very delicate. Being such delicate instruments, that is why we thought we ought to have been shown, at any rate, a little more consideration than an ordinary soap or candle manufacturer.

4828. Who was sent in charge of them, and who looked after them?—At St. Louis?

4829. Or at any of these exhibitions?—At St. Louis I sent them under the charge of the Government, and they paid all the expenses. When I went to Chicago, I stopped there the whole time myself.

4830. That was an expensive thing to do?—It was, but if my exhibit had been in a good position, I should not have regretted it.

4831. (*Mr. Algernon Law.*) Have you made any sales in Canada as the result of exhibiting at Chicago and St. Louis, do you think?—I have had some Canadian trade since, which I can trace to Canadians coming to me there.

4832. With regard to the refusal to receive your exhibits at Paris, did you make any protest? How soon did you apply, because it does seem rather an extraordinary thing?—They sent me papers, and I filled them in for space, but I heard nothing—I am only speaking from memory now. I give them notice about the space that I should require. Then some notice appeared in the papers to say that so-and-so would be the last day when they could receive applications. I went then to the Commission—in Scotland Yard I think it was—and I saw Mr. Lloyd there. He said, "I am very sorry Mr. Darton, but we are full up, and we have no room whatever; we cannot take you."

4833. Did you not make any protest on receiving this reply?—I was rather half-hearted about it, and I did not much care. That is the real truth of it. I do not think the last French exhibition was a very successful one.

4834. Did many other instrument makers show?—Not many. The French had a very fine exhibition at Paris—of course, they would; I mean in our particular line.

4835. I was thinking of your English fellow-manufacturers?—The English manufacturers did not have much show there; there were very few of them.

4836. Have you anything special to say about the management of Liège or of Milan on the part of British organising authorities?—Yes. Liège was badly managed.

4837. What about Milan?—Milan, I think, went very nicely indeed; everything seemed to be very satisfactory. I did not visit Milan myself; I started to get there, but I found the heat so great that I turned back.

4838. Did no one representing you go there?—No. Mr. Hillman, who had done some little things for me before, acted as my agent there, and he did, as far as I could see, as well as I could; he worked very hard for me.

4839. Have you sent any thermometers, or anything of that sort to Germany?—Yes, I have, but not very many. We are not anxious—in fact, we are rather chary of sending them to Germany.

4840. In your *précis* you say, "Those instruments which I have had copied by German makers have been copied from patterns purchased here in London"?—Yes, that is right enough.

4841. Were you one of those who suffered by the imitation of the Physical Laboratory's test-mark on some thermometers that were sent out to Argentina?—I could not tell you.

4842. There were some thermometers, which were traced to Germany, that were sent to Argentina with the Kew mark on them?—I have had thermometers brought into my establishment with my name on, which were not of my make.

4843. Have you had your thermometers tested by the Physical Laboratory?—I send plenty of them down to the Kew Observatory.

4844. Have you ever found those imitated?—I have never found them imitate the "K.O."

4845. They have done so, as a fact?—Have they? They have imitated my electric motors; they have got them up in the same way, and put the same word outside, giving them the same name, and then sent them over here in large quantities.

4846. (*Sir Isidore Spielmann.*) You have participated in six exhibitions, I see?—I think so.

4847. At which of them do you consider the British section was best managed?—Personally, I think the Brussels Exhibition was the best thing I have ever known. I cannot speak about the last exhibition at Milan, because I was not there. That was, as far as I can say, very well managed.

4848. You are referring specially to your section?—Yes.

4849. You did not concern yourself much, I suppose, about the other sections?—No, I did not.

4850. When you speak of the good management of the Brussels Exhibition of 1897, you refer specially to your own section?—Yes. It was not a big section, and I saw the whole of the section; and every exhibitor I spoke to seemed well pleased with the management That is a great deal to go by. When you are over at an exhibition like that, you get fairly friendly with all the other exhibitors.

4851. At which of the exhibitions do you consider the British section was worst managed or badly managed?—I think Chicago, without exception.

4852. I think you also said Liège, did you not?—Liège was badly managed.

4853. You referred to an exhibitor's agent whom you employed; have you any experience of any other agent?—Yes. One thing that the British exhibitors should be very careful of is the choice of the man they get hold of as their agent. There is another man besides Mr. Hillman that I know very well. That is Mr. Arthur Day, who is out in New Zealand now. He is a very honourable man.

4854. On the whole, is your opinion of exhibitors' agents favourable?—It is, of those two I have mentioned; but there are a great many who know nothing about the stuff they handle and who trouble less. If they know that the exhibitor is over here in England, they take his money, charge him big prices—about double what it costs them—for packing-cases and other things, and rob him through thick and thin. Some of these semi-carriers, and men of that sort—shipping agents—say they will be agents for you; but they know nothing about the stuff and they care less. That is where an exhibitor should be very careful. Those two agents I have mentioned I am personally acquainted with, and I would trust them just the same as I would my own brother. I feel sure they are both honest men, and men of business capacity too.

4855. (*Mr. Malcolm Ramsay.*) You told the Chairman of certain orders that you had booked at exhibitions; I suppose you follow up those orders, or that development of trade, after the exhibition, do you?—Yes; we have been in correspondence with them ever since. I have got customers on my books who have been on them ever since.

4856. So that the orders that you have got at exhibitions have led to permanent developments of trade?—Yes. In the same way in travelling, we do not look upon our first orders to pay our expenses.

4857. I understand you to think, looking at it broadly, that the money you have spent on exhibitions has been worth the while?—I think so.

4858. You have got enough out of it, and it has not been thrown away?—I look upon it as a valuable asset. It is like sinking so much in your business for goodwill. I might call your attention to one fact which is lost sight of by a great many people. Through exhibiting at some of those Continental exhibitions we get looked upon as good men over there by the optician. He is a man of some importance. The optician over there does not know much about who's who, and if he gets out a good thing he brings it to you in the first instance;

and so you get the benefit of it in that way—you get the first pull over the others.

4859. I do not want to inquire into the details of your business, but would you mind telling us whether the money that you have spent on exhibitions bears any large proportion to the money that you spend on agents and travellers?—It does not come to anything like the amount I spend on travellers.

4860. Then it is not very much compared with what you spend in that direction?—No.

4861. As far as I can gather, you do not grudge it?—No; but I think there should be a proper system. What you want to do is rather to encourage the scientific man. You want to see the scientific man come and reap the benefit of his brains. You find that sometimes the expenses of an exhibition prevent a really clever man showing anything. Do not forget that. There are a great many people at exhibitions who make a very big show of things, but who perhaps are not the makers at all. What you want to do is to encourage the actual producer of the thing to come forward.

4862. (*Mr. Harris.*) I should like to press you upon one or two points in your evidence. Did I understand you to say that unless you get some awards it is not much good going on with the business?—No, I do not go so far as to say that. I mean to say that unless you get some awards you do not score with big people, with the Government Departments and with bodies of that sort. I am only speaking now of my experience, but I know most of the men in my line, and I am personally acquainted with most of the contractors who work for the Government. There are lots of men who do very good work, but who rarely see Government orders or contracts.

4863. Are you speaking of the British Government now?—Yes. I do not think these people would get the same consideration as they do if they were not to exhibit, because there is always a certain amount of kudos which sticks to a man who has got a lot of medals.

4864. You have given us a very lamentable account of your position at Chicago; can you tell us how it was that you were not choked off from ever exhibiting again?—I do not believe in sitting down under your misfortunes. If I had I should not be here to-day, I think.

4865. How was it that, after all, you got your five highest awards?—I came in contact personally with the jury. Being over there, I was able to explain to them all the technicalities of anything special that I had. That is a great thing with the scientific instrument maker, and, as you can understand, the man who makes the instrument knows more about it than anyone else.

4866. (*Chairman.*) You did not leave that to your agent?—Not a bit.

4867. (*Mr. Harris.*) Can one say that you "nobbled" the jury?—That is it.

4868. (*Sir Isidore Spielmann.*) What medals did you take in Chicago?—Bronze medals.

4869. I thought you said you took the highest awards there?—That is so. They did not give any silver medals, and they did not give any gold medals.

4870. (*Mr. Harris.*) That is, not in your section?—Not in any. At Chicago the medals were all bronze.

4871. (*Chairman.*) Was it not the case that if you were awarded a gold medal you had to gild your own bronze medal?—That is the case in all exhibitions.

4872. (*Sir Isidore Spielmann.*) But there was only one grade of medal at Chicago, you say?—That is all. At St. Louis it was a silver medal; but then I only sent a very small show there.

4873. (*Mr. Harris.*) I should like to understand how you did exhibit at St. Louis after all. You suggested to the Chairman, I think, that it was in part a collective exhibit?—Yes, it was.

4874. With whom did you go in?—I went in with a man named Cossor, a glassblower.

4875. At the requisition of the Government?—Yes. One of the Royal Commission, a young fellow named Baugh, had a good deal to do with selecting the people. He said to me, "I wonder you do not go in for this St. Louis Exhibition." He said, "I think some of those instruments are very nice. You had better show them there. We are making arrangements with Cossor that he should go in for a show-case, and if you like to join him it will not cost you a penny." It did not cost either Cossor or myself anything.

Mr. F. A. Darton.

11 April 1907.

4876. Who paid for you, then?—The British Government.

4877-78. That was not true of most of the exhibitors, was it?—Yes, it was true of all the lot. Mind you, there I think they erred on the side of generosity. I think, properly managed, they could do it at a very small cost to the exhibitors, if their officials were to see it right through and take their proper position. In Chicago, the German Consul had two permanent clerks put under him out there, in order to act as clerks for all the German exhibitors. That brought them hundreds of accounts.

4879. How do you mean that it brought them hundreds of accounts?—Because a German exhibitor arriving there, not knowing the town, not knowing the people, and not knowing even the English language, when he got a man there wanting to buy his stuff, one of these clerks would be sent up and do all the necessary writing for him, stating the prices and interviewing the man; and it did not cost the exhibitor a penny, but he got large orders through it.

4880. Were they orders just for the time?—No.

4881. Did they lead up to permanent work, then?—They have continued to do it ever since. It has been a grand thing for them; it has got them well established there.

4882. Do you think, if something similar could have been done for you, our manufacturers might have reaped a benefit in the same way?—Just the same; I am certain of it. The Germans are very sharp in looking after all that sort of thing. Look at Zeiss's factory. You know that the Government stepped forward and found them £120,000 when they were practically bankrupt.

4883. (*Chairman.*) What Government?—The German Government. To-day their town is probably the most flourishing town in Germany, and never costs the Government a penny.

4884. (*Mr. Harris.*) You said just now, "I know where my goods go, and therefore I know where to send my travellers"?—Yes.

4885. Do you never try to break new ground by your travellers?—Yes, I do. I generally break up new ground myself.

4886. Personally?—Yes; that is the best way. If I can have time to travel myself I can do it very well.

4887. You do not wait for your goods to find their way to a place by means of an exhibition, or in some other way, before you do that?—We look upon an exhibition as a great means of helping us. If I go to an exhibition I always go to the scientific department at once; that is the department that interests me. I carefully overhaul every case that is there, and there is very little that escapes my notice. If I see anything I think is useful to me I write to the man who is exhibiting it. The same remark applies to others. I have got one or two people in Paris now—I suppose it might be half-a-dozen, very good houses—regularly buying my electric motors and things of that sort.

4888. Do you attribute that to an exhibition?—There is no doubt that has been the cause of it. We are looked upon as somebody. Radiguet, the scientist who died the other day, or, rather, his firm, is a customer of ours, and regularly deals with us. We are well known to all these men, but we should not have been if we had not appeared at these exhibitions.

4889. (*Chairman.*) And yet you say you think one every ten years would be quite often enough?—Yes.

4890. Surely, in such things as electric motors and dynamos a great deal happens in ten years?—Yes, there is no doubt there have been enormous strides made in that way. We exhibited at Olympia when the Electric Show was on. That was a private affair, and, although it was a very successful show, I assure you that if it were run every year it would get vapid, and people would not take any notice of it. If it were run as a yearly show it would not pay.

4891. That is a point I wanted to put to you. Are you in favour of those special exhibitions? Would they satisfy you as well as a general and universal exhibition?—That is rather a wide question to answer, and I should not like to say for certain. Personally, if it was a good scientific exhibition I should be delighted to go in, but I am afraid that scientific instruments would not be sufficiently attractive to the general public. It is a curious thing as regards a lot of the

Mr. F. A. Darton.
11 April 1907.

best instruments that it is not the scientific man that is any good to you, but it is the men he brings in his wake. Directly Professor So-and-So says it is a good thing, Mr. So-and-So must have it. Whether he knows much about science or not, he thinks it is a proper thing to do.

4892. I think you said you exhbited at the Electrical Exhibition at Olympia last year?—Yes, and we were very well satisfied with that; it was very good.

4893. Still, you think it should be more of a universal exhibition, with other attractions?—I do think so.

4894. In order to bring a large number of people to it?—Yes. But, mind you, I think some of these exhibitions, like the Paris Exhibition, get a great deal too unwieldy. That is a point you have to consider. Some of the big exhibitions have not been so good as some of the smaller ones.

4895. Because the place was so enormous?—Yes; you got lost in it. Sight-seeing is very tiring, as you know, and if you go over an exhibition for half a day you are very glad to get out of it, aren't you?

4896. (*Mr. Wilson Fox.*) I suppose, when you have been to an exhibition you have walked round it and seen the other exhibits?—Yes.

4897. Could you form, roughly, any general opinion as to how the other British exhibits compared with the foreign exhibits?—Which exhibition are you thinking of?

4898. Take any great international exhibition you like—that you have been to. Can you say whether the British exhibits generally, and apart from your own exhibit, compared favourably or unfavourably with the foreign exhibits?—I think as regards the quality of the goods they compared very favourably; but they were not collectively as fine, as a rule, at the different exhibitions as some of the foreign ones.

4899. It is your point that they were not shown off so well?—That is my opinion.

4900. They did not present such a good appearance to the public?—That is so. The French are very particular as regards their exhibits. When they have taken on a certain space to fill in, they have had the same style of design all through, and they have done it with great artistic taste. Take Chicago. The Germans there made a splendid show, and ours looked like a workhouse. They got some beastly lions' heads, which were not even gilt—they were done with this Dutch paint, Dutch metal—and they were looped up with loops of red and white and blue in the commonest cotton stuff they could buy at the commonest store in Chicago. Do you know that the average American countryman is a great deal more innocent than our ordinary English countryman?

4901. (*Chairman.*) Are you referring to the thousands of people one used to see coming into Chicago from the West?—Yes. It seemed to me with the majority that the people who got on best with them were the men who told the biggest lie. The larger the legend they told them the better they seemed to enjoy it. I am sure that the British exhibits, if they are properly placed before people, will go off all right; but we are not such puffers as the Americans, you know.

SIXTEENTH DAY.

Thursday, 18th April 1907.

PRESENT:

Sir Alfred E. Bateman, K.C.M.G. (*Chairman*).
The Right Hon. Sir James Kitson, Bart., M.P.
Mr. A. Wilson Fox, C.B.
Mr. C. A. Harris, C.B., C.M.G.
Mr. Algernon Law.
Mr. Malcolm Ramsay, C.B.
Sir Swire Smith.
Sir Isidore Spielmann.
Mr. U. F. Wintour (*Secretary*).

Sir Albert K. Rollit, called and examined.

Sir A. K. Rollit.
18 April 1907

4901*. (*Chairman.*) What has been your experience in connection with exhibitions?—I have been President of the Brussels, Antwerp, Bordeaux, Liège, Milan, and other British Commissions, and a member of the Royal Commission for Paris, 1900, etc., and of the Amsterdam and Kiel Commissions.

4902. You formed the Brussels Commission, I understand?—Yes. I was asked, as President of the London Chamber of Commerce and Chairman of its International Exhibitions' Committee, to undertake the formation of the Brussels Commission by Lord Curzon, as Under-Secretary of State for Foreign Affairs and Chief of the Commercial Department of the Foreign Office; and a grant made for this purpose to the Commission was accompanied by a request from Lord Curzon that the London Chamber of Commerce should organise the Commission, that I should be its President, and that Mr. Dredge should be the executive commissioner. I mention that because it is the *fons et origo* of the action of the London Chamber of Commerce in connection with International exhibition commissions.

4902*. That was in 1897, was it not?—That was in 1897, upon the initiative of Lord Curzon. I assume Lord Curzon desired thus to have both a collective and personal assurance of the proper administration of the grant.

4903. We should like to know your opinion as to the effect of international exhibitions?—My opinion is that international exhibitions promote international trade and benefit the political relations between States—both being, in my opinion, matters of the greatest importance, especially in modern times, when the chief feature of the general position is the growth of internationalism and the spread of international trade and commerce. International exhibitions subserve the purpose of comparison and present points of competition, and they are one of the best forms of national industrial advertisement. I should like to add that by advertisement I do not at all mean entirely individual advertisement of either firms or business men, but advertisement of the industries and progress of countries. May I also add that I think one important consideration to bear in mind is that exhibitions are object lessons of the relative conditions of industry and of the possible points for improvement. One great consideration is, that while many men would not go to a foreign country, probably in some cases very distant, merely to explore, they would and do combine business with pleasure, and take the opportunity of getting to know something of the *personnel* of the nation which is holding the exhibition, and at the same time of observing the conditions of its industries and of the industries of other nations as compared with our own. Thus they get most valuable business information. If I were asked to mention firms who had got that advantage, I would reply that the theory of exhibitions is by no means an exact science, and I do not recollect individual cases; but I have made general inquiries and I have exercised on many occa-

sions general and careful observation, and what I have said is the summary of my opinion.

4903*. We do not want from you so much the experience of individual exhibitors, because we have got a good deal of that from them; what we want is your general impression?—It is a general impression that I have conveyed. May I say this as an illustration—that it was a revelation not only to myself—a man of no special knowledge on the particular subject, though I was greatly surprised—but to many business men to observe at Paris the vast progress made by the United States and Germany in relation to special machines. I am thankful that when there was great room for advancement on our part observation has tended greatly in that direction; at any rate, that was a great lesson at the Paris Exhibition.

4904. I understand you think there is no option, in the interest of British trade but to take part in international exhibitions?—I think not, if we are to keep well in the race and under the notice of other nations. I am satisfied that it is not a question of whether a particular exhibit is good (though of course that is often useful); it is a question of whether the country is keeping up to the times and availing itself of the progress of science and of its necessary adaptations to industries, also of design and taste and presentment of goods. Then exhibitions afford an opportunity of bringing new products, novelties, and specialities under general notice. The general use abroad of British agricultural implements, some special machines, and of sanitary appliances, is one indication of the benefit of such exhibits. As I say, I think there is no option, in the interest of British trade, but to take part in international exhibitions. We must put in evidence our ability to compete and to bear comparison, or we shall be beaten. The political benefit is shown by the undoubted fact that the International Exhibitions at Bordeaux and Paris, coupled with their official and commercial recognition, by the Corporation of London in the former case, and by the Association of Chambers of Commerce in the latter, have been prime factors in the achievement of the *entente cordiale*. I may say that I went to the Bordeaux Exhibition with the Lord Mayor, to whose recognition of that exhibition I have just referred as "official," and undoubtedly the first ripples of the *entente* were then heard at Bordeaux, and were, in my opinion, emphasised and carried into great practical effect when the Chambers of Commerce met in Paris in 1900, its International Exhibition year.

4904*. That is very interesting; what was the date of the Bordeaux Exhibition?—That was held in 1895. May I add also that Bordeaux was a very free trade city, and that it had great English connections in trade? It was the city of Richard of Bordeaux, and there were many traces of the old English occupation, and of English names—all of which, I think, tended to the very good feeling which was promoted so much by the visit, under the auspices of Sir Walter Gilbey, with whom we were staying at his chateau in the Medoc.

4905. As that was in 1895, it took some time to bear fruit, because the feeling in Paris was not very friendly for some years after that?—I admit that; but there were special causes—Fashoda and the "Pinprick Speech." But these were only passing interruptions of a general feeling.

4905*. You approve of grants being made by the Treasury in aid of the British section, I presume?—Yes.

4906. Do you think, judging from your experience, that they have been well, economically, and beneficially administered?—In my experience, they have, as a rule, been well, economically, and beneficially administered. In the case of Brussels we made a return to the Treasury of about £820, as a surplus from the grant of £4,000 for the Commercial Section and £1,500 for the Art Section, which was a very great feature, perhaps the best show of that kind that has been done on the Continent. In the case of the Milan Exhibition, there will be a much larger surplus—probably £4,000 to £5,000—from the grant of £10,000. In the case of the Brussels Exhibition, the Commission formed by the London Chamber of Commerce received the thanks of the British and Belgian Governments for their services. I may add, as it has a bearing on the matter, that the Commission itself raised a guarantee fund of about £7,000 to protect the grant—lest the grant, I mean, should be inadequate.

4906*. Was that in the case of Milan or Brussels?—That was in the case of Brussels. It was done to enable us to deal freely with the grant.

Sir A. K. Rollit.

18 April 1907.

4907. Now, we will go on to Milan, I think?—In the case of the Milan Exhibition, I had numerous interviews as to the grant with both the former Chancellor of the Exchequer, Mr. Austen Chamberlain, and the former Parliamentary Secretary of the Board of Trade, Mr. Bonar Law, both before and after a deputation from the Commission waited upon those gentlemen; and with great difficulty and after very long negotiations, the grant of £10,000 was obtained, which, I believe, was largely due to the representations of Mr. Bonar Law, and also to political considerations. I might mention that as a last resort, I asked the Italian Ambassador to communicate with the Government and others and to point out such considerations; and I believe that ultimately led to the grant being made. The negotiations continued for several months. At one time, it appeared probable that the grant would not be made, whereupon, as we felt the necessity, we nevertheless proceeded with the work of the Commission and should probably have carried it through in some form, as at Liège, but our work was of course greatly aided by the grant. I may say we proceeded after a conference with the representatives of the exhibition from Milan, and we should have provided like we did in the case of Brussels, the necessary funds rather than let the thing fall through; and as the results have proved, if we had formed a guarantee of £7,000 and used it all, it would have been fairly adequate. The grant was nevertheless made late, and was too small for many purposes and more than was necessary for the time and conditions under which we had to do the work.

4907*. That is an important point, because you have already told us that you think of paying back from £4,000 to £5,000, which looks as if you had asked for too much money?—It appears to be a paradox, and I will explain it. We had £10,000 to deal with. We did not, as in the case of Brussels—I do not know why—form a guarantee fund to protect the grant, but if we had thought of it I think probably we should have done so. We always had to work according to the limit of our cloth, and we could not do what I think ought to have been done—namely, make some definite promise to exhibitors that we would do what we ultimately did, out of the surplus, when we were sure—namely, make a return based upon the amount we charged them for space, in order to partially recoup the cost of transport to, and in, Milan, and terminal and other charges. Transport charges are excessively heavy in most cases, and in the case of transport in Milan they were exceptionally so. We could not tell exhibitors firmly that we would make some contribution towards the cost.

4908. Was that because you had not got your grant early enough?—It was partly because we had not got our grant early enough, and partly because we did not know how far it would go according to the exigencies. Therefore we were in this position, that we could not deal as definitely as we could wish with the exhibitors. If we had been able to do so we could have no doubt induced more exhibitors to come forward.

4908*. Have you got this money to spare because you did not get sufficient exhibitors?—It was owing to the lateness of the grant and its limited amount.

4909. To the lateness of the grant?—Yes, and I would also say that it was owing to a circumstance which I think is worth mentioning. Exhbitions, like everything else, grow, and even the promoters themselves did not realise, either at Brussels or Milan, the extent to which their exhibition would grow. At Milan it overgrew, and we found that owing to that we were pressed for time and as to space, etc., etc. We did not get the grant till September. Mr. Serena and I instantly went off to Milan, and made the best arrangements we could as to space. We came back, and sold it at 2s. per square foot to our exhibitors, which was a low price; and if we could have said definitely, "We will either give you space or help you towards space," or "We will defray some of the transport and terminal charges," I am sure we should have got more exhibitors.

4910. What was the mode of the formation of the Commission?—In connection with this my evidence may be as useful as upon any point. We have on the London Chamber of Commerce—and I think it is the only organisation for that purpose—a standing International Exhibitions' Committee, which is a permanent

Sir A. K. Rollit.

18 April 1907.

Committee, of which I am the chairman. We have had it for many years. It is without funds, except those of the Chamber. We do all we can to get intelligence about exhibitions, and when we hear of one likely to induce Great Britain to take part in it, we take some preliminary steps. We do our best to get provisionally a grant; if we cannot get a grant we still go on—we did at Liège without a grant at all.

4911. Does your Committee decide whether the exhibition is worth having a grant for?—Undoubtedly—that is, in our opinion. We go carefully into all the details furnished to us. Deputations come over and interview us, and we thoroughly thresh it out with them. Then we recommend to the Council of the Chamber either that they should take action or the contrary. If the Chamber resolves to take action, we consider whether we can induce the Government to participate and to definitely make a grant, which is important for two reasons: It is the outward and visible sign of recognition, and therefore most important in the view of the nation where the exhibition is; it is also an official sanction of the action of the Commission; and perhaps, above all (though the other two points are very important), it gives means of action.

4912. I think we should like to know the composition of this Committee; do they represent manufacturers as well as merchants?—Undoubtedly; but remember, please, that London is not a manufacturing city in the ordinary sense of the term, though it is a much greater manufacturing city in the shape of household, domestic, and other industries than people suppose. It is a Committee consisting of business men and experts; and I could have mentioned, if I had thought the inquiry would have been made, many men of standing. I will put in a list of the Committee.

4913. (*Sir James Kitson.*) Have you a permanent secretary?—We have one of the clerks in the Chamber allotted for our work, who does it regularly; in that sense he is the secretary of that committee. I think I spoke just now of myself as being the permanent chairman. I should have said that I have been chairman for many years consecutively though re-elected yearly.

4914. (*Chairman.*) Do you think the Committee of the London Chamber of Commerce is as capable of doing that work as a committee of the whole Associated Chambers would be?—I think it has done its work, as proved by its surpluses and (under difficult conditions) its comparative success, well; but if I were forming a permanent organisation I should undoubtedly form one composed of the London Chamber of Commerce, which is a Chamber of some 4,000 members—no other can approach it—and of the provincial Chambers. But that brings me to our next step. The next step we take, is to have a meeting of the Exhibitions' Committee to go through the lists of the old commissions, so as to get continuity and expert assistance, and to add representatives of the Provincial Chambers, whom we welcome. I think the Presidents of the Manchester and Leeds Chambers, the President of the Associated Chambers of Commerce, and I should say nearly 20 representatives of the Associated Chambers were members of the Commission. Sir Edward Fithian, the secretaary of the Associated Chambers, has been one of the honorary secretaries in all cases as far as I remember—certainly in Milan and in Brussels.

4915. You are speaking now of the Commission which you formed?—Yes. Then anyone—I am speaking generally—who was eligible, we have been pleased to add. We communicate widely, and I always take willingness to work as one good criterion of the probable value of the work. We had a most representative and influential Commission. I can give you the names, of course.

4916. We do not care about that; the only point for us is that the first steps were taken by your Committee of the London Chamber, who, on their own responsibility, settled that a Commission should be formed for a particular exhibition?—Certainly, but I repeat that the official *fons et origo* was Lord Curzon, not the London Chamber.

4917. Lord Curzon, of course, is no longer in the Government, but you are a permanent body?—I think it was a very good plan, subject to the modifications I have indicated, and it has worked well.

4918. You have told us the steps which you took, which show that you got a very excellent Commission together, including members of the Associated Chambers of Commerce, as you have told us?—I think of the total of about 90 at least some 20 were connected with the provincial Chambers in addition to the Associated Chambers.

4919. Then you gave your offices free of cost, which was very useful?—The London Chamber gave the use of offices free of cost throughout, but they were quite distinct, in a building which we let to many other people. The Chamber also, in the first instance, gave much clerical assistance. Owing to the shortness of the time we had much difficulty in obtaining exhibitors, but we did everything in our power to this end. Business was also beginning to be brisk, and this was necessarily an additional impediment, having regard to time. I believe the exhibitors were perfectly satisfied with the action of the Commission. I spoke to some of them at the Exhibition, and also to their representatives, and they so expressed themselves. But we had not been able to do as much for them as we wished owing to the smallness of the grant, especially having regard to the heavy transport charges in Milan and previously, though we have returned out of our surplus a proportion of the charges in proportion to space taken, according to an understanding which we made previously, because we did not know how our grant would plan out. Foreign Governments and organisations do a great deal more for their exhibitors, notably in France, where there is a permanent institution in aid of exhibitions and exhibitors, with what I may call exhibition stock-in-trade—uniform show cases, etc. This is a recognised public institution in France, and it is, as I know from local knowledge, as a former director of the British Chamber of Commerce and a resident for some years in Paris, highly approved. While some more permanent organisation might be desirable in this country, I consider that in the case of the exhibitions I have mentioned, the organisation and machinery have been good and effective and economical, chiefly owing to the co-operation of the Chambers of Commerce; while continuity of knowledge and experience has been maintained by the Exhibitions' Committee of the London Chamber of Commerce, and by the appointment on each successive Commission of members of former Commissions. Had more time been given by the earlier allocation of grants much more would have been done. Between September, when the grant was made, and the opening of the exhibition in the early spring, the work was necessarily done under the greatest pressure. Having regard to the amount of the grant and the time available, the result was satisfactory, especially in certain departments closely connected with the leading industries of this country, such as agricultural implements, land transportation, sea and inland water transportation, decorative arts, the Industrial Working Hall, etc. May I mention about the Industrial Working Hall that it was an innovation and an excellent one? It was very interesting. You saw the whole process of manufacture by a special machine, and you saw the result. But it limited us very much in obtaining exhibitors, for we could not show anything except it was in process of manufacture. It was not a universal exhibition; it was an international exhibition, but not a universal exhibition. We tried to get a collective textile exhibit from the West Riding, but a collective exhibit, unless the machines producing all the products were there, was not admissible. The department and the departure were excellent, but the result was a little unfortunate as far as British exhibitors were concerned.

4920. Now will you deal with the question of awards?—I was a member of the superior jury or jury of appeals, and am of opinion that the greatest care was exercised in making awards, in which Great Britain was very successful, both absolutely and relatively. We took a greater percentage of awards than any country except Germany, and we took more gold medals (which is the third grade) than Germany itself. The Italian Minister of Commerce presided over the meetings of the superior jury, which lasted the greater part of a week; and from what passed I am satisfied that the sectional juries had, as a rule, done their work well and carefully; and I know that in the case of the jurors for Great Britain (notably Sir Thomas Brook-Hitching and others), whose services were honorary, the work had been well done. Some criticism was made or rather inferred by questions in the House of Commons as to the appointment of one of our jurymen, but I am satisfied that there was no ground whatever for any complaint or complaints which have been made, and such questions indicated a great want of knowledge of the actual facts. That was a case of the Fisheries, where the Japanese Commissioner, we having no fishery expert, acted, and

acted most ably for us. May I just give one illustration of the value that an exhibition may be? I went to that exhibition, and owing to what I saw with regard to the Fisheries—I am commercially very largely interested, and have been so for years, in the deep-sea fishing industry in the North Sea—I came to the conclusion that there was a great opening in the Adriatic. The North Sea now is so depleted that we have to go, I may tell you, from Iceland to Portugal to get our fish. I came to the conclusion, as I say, that there is a great opening in the Adriatic. That will give you a purely casual illustration of what anyone may learn from an exhibition, which led me to go to Trieste and examine the matter more closely, with the result that I made recommendations to my Hull Steam Trawling Company on the subject. For the same reason I went to see the Fishery Exhibit of the Roumanian Exhibition at Bucharest.

4921. Did you get the information which led you to that conclusion by going to the exhibition?—Yes, and by going to the Roumanian Exhibition, which I saw at Bucharest, and to the fish market at Trieste. I came to the conclusion that the Adriatic is a place where, owing to the backwardness of the Italian fishing industry, there might be a new field for British enterprise—certainly there is a great collection and variety of fish there.

4922. Now I come to a very important point—that is, your suggestions for improvements in organisation. I think you do not favour a Royal Commission as the best means of administration?—No, I do not.

4923. In that you differ from a good many of our witnesses, I think. You do not seem to attach importance to having a Royal Commission, with the prestige and dignity which would attach to it?—I have seen that there has been some difference of opinion about it. I speak chiefly from my knowledge as a member of the Paris Commission. In the case of the Paris Commission, evidently someone had organised it, or someone had disorganised it, without local knowledge to any extent, and without commercial knowledge, for it was notoriously deficient in the commercial element. I attended as a member of the Commission only two meetings. At the first we received resolutions appointing committees—all printed and ready with the names—and at the last we passed a vote of thanks, or received a vote of thanks, or said we ought to receive a vote of thanks, for our services. I was placed upon a committee which I had no connection with. On some other Committee I might have been useful, but I was placed upon the Furniture Committee. If there is a subject which I take less interest in than another it probably would be that. I am only taking one case of a square man in a round hole, or of a round man in a square hole; and I saw many illustrations of the same fact.

4924. You think a Commission organised by the London Chamber of Commerce would be a better organisation?—I think so, if organised with a standing Committee in permanence—not by the London Chamber necessarily, but by co-operative action on the part of the Chambers.

4925. What part, if any, would the Government take in that?—I should say the Government would be among the constituent bodies, and largely represented, through both the Treasury and the Board of Trade; but I do not think it should be a Departmental Government Committee. That is my own impression.

4926. Did you attend more meetings of your Commission at Milan than the two you attended at Paris?—I should think I have attended 30 or 40, including Committees.

9427. Forty meetings of the Commission for the Milan Exhibition?—I should think so.

4928. Not out there?—I am including the Commission and its committees. I was chairman of the executive, and of other committees, and for a week a member of the superior jury. I should think I have attended thirty meetings, at any rate.

4929. Who would you make the chairman of the permanent body?—I am a believer in election. I think it is best for a body when formed to elect its own chairman. It knows who is the most likely man to do the best work.

4930. Would you have a permanent committee or commission of the Chamber of Commerce?—I should have a permanent committee, the basis of which should be the Chambers of Commerce, because exhibitions are commercial undertakings. It should undoubtedly have representatives of Government and of the departments. That, I think, would be the best nucleus; and on the occasion of any particular exhibition it should have representatives of the trade and commerce with that country and also exhibition experts.

Sir A. K. Rollit.

18 April 1907.

4931. Then you want money; I see you say at the end of your proof: "With the aid of Government grants." Would you ask for a particular sum of money and expect to get it from the Treasury?—No. Everything depends on the circumstances, and the Government would have the last word about that, of course—absolutely. It would depend to a certain extent upon the representations we made and upheld. I do not seek at all to get the control for this committee for the London Chamber, though I wish particularly to add that in the Brussels report we recommended—and I think it would have been wise to have given it—that the surplus we returned of about £800 should be the nucleus for minor exhibitions to enable us to do some preliminary work. I think there should be a fund, even of a very moderate amount, for that purpose.

4932. Would you not come across the Public Accounts Committee very much then? It would be worse than a grant in aid, would it not, if it was to be carried over from exhibition to exhibition?—I do not think so. It could be made as a grant with no liability to return, only to account; there are Parliamentary precedents for such cases.

4933. You mean that it should be granted to a particular body?—Yes, to the permanent commission. May I say that I think that would be the nearest approach (and in the best direction for this country) to the French system, which is rather more bureaucratic than I think would be well here.

4934. You do not like the German system then?—Certainly not; that is thoroughly bureaucratic. At the same time it has been very effective, and very liberal money grants have been made—there is no denying that.

4935. You want to get money, and you want to keep it thoroughly in the hands of the commercial people?—With adequate Government control and representation. The basis—I use the word advisedly—should be Commercial; it would be for a commercial purpose.

4936. You are aware, of course, that the French system is a little different from that? You have got the basis of a grant, have you not?—Yes.

4937. And the people also subscribe, do they not?—I do not know whether they subscribe, but the Government helps. They have funds to provide cases, to do provisional work, and to meet preliminary expenses; and most effectively do they present their goods.

4938. Would the Commission for a particular exhibition be the judges as to what should be exhibited? Would they have the control of the collective exhibits?—When an exhibition was undertaken, I should think they would have to co-opt persons connected with the particular countries and industries, and when the Commission was thus extended I think they should be the controlling body as to the commercial part of it. Of course, if they did their work badly, then, like any other department, they would be under the control and criticism of Parliament and of their department.

4939. The control and criticism of Parliament is generally exercised through some department, is it not?—It has been attempted to be exercised as to Milan in several questions which had not a shadow of substance about them.

4940. You mean questions in Parliament, but I mean that the control of Parliament is generally over tht departments?—The influence of Parliament is much beyond the departments.

4941. Then you would not contemplate having this fund audited by the Audit Office, would you?—I do not know why a special provision to that effect could not be made. We are not bound down absolutely by precedent in such cases. I do not see why it should not be audited just like local accounts, or why there should not be a report. It might be part of the terms of the grant that a report with accounts should be presented to Parliament.

4942. (*Sir James Kitson.*) In your opening statement you said that the general use abroad of British agricultural implements, some special machines and sanitary appliances, is an indication of the benefits of such exhibitions. Are you aware that long before the era of exhibitions British agricultural implement makers, like Clayton, Ashworths, Robeys, and the rest, had

Sir A. K. Rollit

18 April 1907

established a great trade on the Continent?—Undoubtedly.

4943. I suggest that you attribute a little too much importance to the extent of exhibitions on that particular industry?—I am perfectly prepared to modify my statement to *one* of the advantages of exhibitions. I think I said so—at any rate, I intended to convey it—that *one* advantage of exhibitions had been that.

4944. The Committee is anxious that the importance of exhibitions should not be exaggerated, so I take you on that point. There is an enormous business done in that, and we lead in that branch of industry, do we not?—Undoubtedly.

4945. And we lead, not in consequence of exhibitions, but in consequence of the excellence of our manufactures?—I suggest partly in consequence of the advertisement by exhibitions, and, of course, otherwise.

4946. With reference to the advisability of assistance, you make a point of the *entente cordiale* and of political relations; but should trade not be considered rather than possible political advantages?—Trade is the primary consideration and factor beyond all doubt, but I was speaking rather historically, and political considerations have had weight in St. Louis undoubtedly, and in Chicago, and, as I know, in Milan.

4947. You gave us quite a full statement as to your work on Commissions and so on; and you say that in the case of the Milan Commission you would have carried it through in some form, even if you had not had a grant?—Certainly, we had practically arranged to do so.

4948. How would you have carried it through?—We should have carried it through probably as we did in the case of Brussels, by forming a guarantee fund; and I do not doubt for a moment that we should have had assistance in various other ways.

4949. Would your guarantee fund have come from interested traders?—Not at all. It was subscribed by members of the Commission in the Brussels case, and would have been so in this case.

4950. What would be their reason—patriotism?—Certainly. In the case of Brussels many of us guaranteed £200 apiece, simply to protect the grant and to enable us to have a freer hand in dealing with it at an earlier stage than would otherwise have been possible.

4951. If you were so public spirited, do you not think the Government might rely upon that public spirit in the future rather than on grants?—I think it would be very unfair, I will not say to rely upon it, but to expect it or to ask it as a regular thing.

4952. I think you made a casual observation that the London Chamber of Commerce could not rely on London, because it was not a manufacturing centre?—Hardly that. I said that it was not generally regarded as a great manufacturing centre, but I added distinctly that, taking into account the domestic industries, the household industries—as distinguished from large manufactories and mills—it had distinctly a large manufacturing character.

4953. The information which has been given to us is that London is growing, owing to the fact that it is becoming a great industrial centre?—I should have said that the industries were migrating largely to Reading, Huntingdonshire, and other places, where I see them from the railway; but it is still much more than people generally suppose a manufacturing centre.

4954. I am only suggesting that you, as the representative of the London Chamber of Commerce, should keep up your flag?—Certainly. I think you did not hear that I said I should not take it down, or, perhaps, I should say did not infer that from what I said.

4955. You say that notably in France there is a permanent institution in aid of exhibitions and exhibitors; do you know what the cost of that permanent institution is?—I cannot say at the moment.

4956. Can you give us any guidance as to the cost of this proposed permanent Commission which you suggest?—It ought to be very slight, and I believe on the lines I have mentioned that the cost would be inconsiderable.

4957. (*Sir Isidore Spielmann.*) I think you say in two places in your proof that you regard our participation in these exhibitions as competitions; you say we must put in evidence our ability to compete and to bear comparison, or we shall be beaten?—Yes, in the long run.

4958. Are you not of opinion that we are usually beaten at these exhibitions—I am referring to the British sections?—No. The awards show exactly the contrary, both at Brussels and at Milan. In quantity it may be, and, time and other things considered, that is not wonderful; but in quality undoubtedly the awards show beyond question that we are well to the front.

4959. Do you regard the number of awards as indicating success?—Yes.

4960. Even when the number of awards is obtained by a scramble, as it were, on the part of our jurors?—As far as my experience, knowledge, and belief extend, that is not a correct or fair statement of the facts. As a member of the superior jury I had no reason to suppose for a moment there had been anything of the sort, and the appeals brought before us indicated the contrary. I have a report which I could refer to which also indicates the contrary. Of course, as in all cases, there will be defects in management of some sort; but, taken as a rule, I entirely dispute the statement.

4961. We have been told by witnesses who have given evidence here that awards are often obtained for this country in the way I have described—that is to say, there has been a scramble for those awards?—That I decline to accept in the case of Milan or others I have been connected with.

4962. As regards the general effect of the British exhibits, do you consider that the British sections, as a rule, compare favourably?—Time, grants, and circumstances considered, I think that the British sections have done very favourably; and I say the awards confirm that view.

4963. But as regards the general appearance of the British sections, as compared with the appearance of those of France or Germany, what would you say?—What could we do for appearances or in decoration or a pavilion, etc., at Milan with a grant such as we had? We had to dispense, advisedly, with outward show and decoration, and to make the best of our money by inducing exhibitors to exhibit. We did not attempt any show.

4964. I am not particularly referring to those exhibitions where you yourself have been President of the Commission; I am referring to the British sections at all the international exhibitions. Do you not consider that, as a rule, they compared unfavourably in the general arrangement of the section and were inartistic as well?—I agree that that is so; but it is a national defect, comparatively, of our nation that we do not do sufficient about the presentment of our goods in any way, even in our own markets, as compared with France and other countries. One of the objects of comparison by an exhibition should be to improve that; and I think it is improving.

4965. Do you consider that the small amount of the grant has had anything to do with it?—Undoubtedly. If we had had a freer hand, I think, we should have attempted more in the earlier stages, I will not say in the way of decoration, but in making the sections more distinctive. We might, for instance, if so determined, have had even our own pavilion, as Belgium had, which, I think, would have been of some service, by aggregating more of our exhibits.

4966. Later in your proof you say that when the London Chamber of Commerce promotes an exhibition you confer with other Chambers of Commerce in Great Britain. What is your experience as to the result of such efforts? Do you consider they take a sufficient amount of trouble to procure you exhibitors?—What we did in the particular case of Milan was to send our assistant secretary from the Chamber of Commerce to several provincial Chambers, to give information in the shape of answering questions and a short address. In regard to personal co-operation, through the President and Secretary of the Associated Chambers and the Presidents and members of several individual Chambers there was co-operation. But I am not goin to deny at all that there is an indisposition in this country to exhibit, which I regret and lament, having regard to my opinions; and to that extent I admit there was not that alertness which there ought to have been; in my view, of course.

4967. As a rule, do they procure you exhibitors, or do they disappoint you?—I think they help to the best of their ability. There are Chambers of Commerce and Chambers of Commerce.

4968. (*Chairman.*) I think we shall all agree with that?—Those who know.

4969. (*Sir Isidore Spielmann.*) You say that at Milan you could not do more for the exhibitors, owing to the smallness of your grant. But you returned money. Why did you not spend that money, and do more for them?—I explained that paradox—I wrote it as a paradox in my proof of evidence—by saying that it was to small to enable us to act early and energetically, instead of being compelled to constantly regard the limits of our cloth. It admitted of a surplus because we worked things economically and finely, and in the end we shall be able to make a return to the Treasury. But if we had had more we might have helped transport and terminal charges, and we should probably not have charged even so much as we did for space; we should certainly have helped more with regard to the storage of cases and the like. I stated it as an apparent paradox on the face of it, and I gave my explanation.

4970. (*Mr. Harris.*) If you have this money to return, what has prevented you from giving a greater return to the exhibitors, instead of returning it to the Treasury?—We had an understanding with the exhibitors that if we had a surplus we would return them some 25 per cent.; that was our bargain. But, of course, the surplus, though a surplus, was not ours to use, and if we had paid them all their expenses I think the Treasury might have said, "Well, that was not your bargain with them. Your surplus ought to have come to us, or you should at least have taken our direction." We went to the utmost limit that we felt we properly could.

4971. (*Sir Isidore Spielmann.*) With regard to your always working against time, and to the pressure under which these exhibitions are said to be promoted, how does it happen that when the London Chamber organises an exhibition they have not plenty of time? We are often told that when Royal Commissions are formed, exhibitions have to be promoted against time, but where you have plenty of time, and where you are your own masters, why is there pressure then?—I may mention first that the preliminary negotiations with the exhibiting country are often prolonged. They do not realise very often at first—and they did not either at Brussels or at Milan—the scale on which the exhibition is going to be. You have deputations to see, and particulars to get. The first step, and it is often a long one, is to get to know accurately and definitely what is intended to be done. Then you have to visit the country. Next you have to convince our Government on all these points. It took months in the lobbies at times when we divided during one part of a Parliamentary Session seeing both the Chancellor of the Exchequer and the Parliamentary Secretary of the Board of Trade. Hence time goes on. I did not get the personal promise of a grant till August, or, officially, until September, and the exhibition was in April. There is where the time is lost.

4972. Do we understand that you favour the voluntary system of allowing the exhibitors to send what they please?—As a universal rule, I should say no; there must be some selection and supervision, unquestionably. Even now we should not act otherwise, and we sometimes reject. We should not take any member on the Commission, though we accepted everybody, I know, except one; but we should not commit ourselves to accepting anybody and everybody, and we should not accept any exhibit. As a general rule, certainly, anybody should not be at liberty to exhibit whatever he chose, it should not be.

4973. What is your opinion of collective exhibits?—I approve of collective exhibits, and we did our best to get one; but the Working Hall conditions proved a great obstacle. You cannot get a collective exhibit very well, and send out several machines which may each differ in some points of detail, and show all in work and show all the different products at the same time, which was the condition. The collective textiles exhibit which we tried to get was not admissible. But I am distinctly in favour of some collective exhibits. At the same time, you will always find a good deal of—I do not like to use the word jealousy, but—independence on the part of manufacturers in preferring to show their own wares separately, instead of associating them with those of others. I know it and can quite understand it.

4974. Do you not think that the frequency of exhibitions is detrimental?—There is something to be said on that point, I agree.

4975. Have we not difficulty in obtaining exhibitors, owing to their frequency?—Possibly, to some extent. Mere frequency, I agree, is a point for comment.

Sir A. K. Rollit.

18 April 1907.

4976. You made a very strong point of that in the report which you signed as a member of the Royal Commission for the Paris Exhibition?—I do not go back, if I can ever help it, on what I have said, and I think I am saying the same, practically, as I may have written or signed there. Everything was prepared for us, and we did not dissent, if the necessity could be avoided.

4977. With respect to the grants, would you advise our continuing to participate in exhibitions if only small grants are given?—Yes. If no grants are given I should do my best. You are an advocate of exhibitions, I read, and I am the same; and I should still do my best to try to get the country represented.

4978. Suppose you cannot make a good show in comparison with other countries?—Then, in any walk of life, I should not do it. If I were not going to do it reasonably well I should not do it at all.

4979. Did the London Chamber approach Belgium as regards participation in the Brussels Exhibition of 1897?—No. My remembrance is that several of us, including, I think, Mr. Dredge, had been connected with the Anewerp Exhibition, and naturally they made the approach to those connected with that exhibition to take up the one in Brussels. That was, I believe, the origin of the matter. They approached us, so far as my recollection extends, but it is years ago.

4980. We hear of an exhibition in Brussels again in 1910. Has the London Chamber taken action with respect to that?—It has had it under consideration for some time.

4981. Has the Chamber stated that it would organise an exhibit from this country?—As far as I remember, the Exhibitions Committee has virtually approved the proposal. That went before the Council, and I think the Council affirmed it, and decided that it would act in connection with the exhibition at Brussels in 1910, if desired. It is part of its routine work to look forward to exhibitions. It has not gone beyond that stage.

4982. In a good many of these exhibitions which have been promoted both by the Chamber of Commerce and by Royal Commissions, where the industrial section has been weak have you not found it the case that the art section has very frequently come to the rescue, and saved the credit of the country in a great measure?—I have been wishful to give every possible credit to the art section at Brussels as I have done to-day, but I do not quite accept that view. We contributed £735 from the Brussels Commission in aid of the art section.

4983. I am not referring to the amount of the contribution?—No, but still there are both sides of the question to be considered. I admit the full value and great success of it at Brussels; but I put that other point forward, too. Art was a section of the Brussels Commission.

4984. Do you regard the Brussels Exhibition of 1897 as a great success commercially, apart from the art section and the section of ship models?—I think that for Belgium, as an industrial and engineering country especially, under Mr. Dredge's arrangements, machinery was well and adequately represented; and that that was the essential thing. With regard to art, I have already said, and I admit, that art was most adequately represented; but, after all, the art section was a committee of the Commission, and we contributed £700 to £800 in aid of the art section, and we were very much gratified by the result of the art section.

4985. I did not want you to say anything for art?—I know; but if you put it one way, I must put it the other way.

4986. I wanted to know whether you consider, apart from art and the collection of ship models, the British section at Brussels was a success?—Yes, certainly, as shown by the awards, and by my own observation. We owed much to Mr. Dredge especially from his engineering connections.

4987. (*Mr. Malcolm Ramsay.*) Might I follow up Sir Isidore's questions and ask you how often you think it would be advisable for this country to be fully represented at exhibitions—at what intervals I mean?—I do not think that you could demark the matter quite in that way. It would depend upon what exhibitions were coming on. I doubt whether you could ever say,

Sir A. K. Rollit.

18 April 1907.

"We will not take part in a great exhibition at Brussels or Milan, or Bucharest, etc., because we took part in one last year at Belgrade." I do not think you could quite go on those lines; but, of course, that would be a factor to be taken into account.

4988. You have given us a list of eight Commissions, I think, in which you have actively assisted as an organiser within the last ten or twelve years, including Brussels, Bordeaux, and Milan, not to speak of the ones in which there were Royal Commissions?—Yes. They are widely divided, and some of them were of a very special character, like Kiel.

4989. Would you have recommended that the Government should participate in all of these?—No, I do not think that they should, nor did they. I think personally—but it in only my opinion—that it was a mistake not to do so in the case of Liège; but some held there were political considerations perhaps the other way in that case, as compared with the time of Brussels.

4990. You are not prepared to specify any stated interval?—I do not think that principle could well be adopted, because an important exhibition might come forward which you could not refuse to participate in, and if you made that rule you would then be put in a wrong position. For instance, a rule was beginning to be set up that a grant should only be made to capitals, and it was forgotten, when that principal was urged against Milan, that Chicago was not a capital, and that other places—*e.g.*, St. Louis, were not capitals, whereas Milan was the industrial capital of Italy. That we had to argue for months.

4991. I suppose official participation would involve a grant of public money?—Not necessarily.

4992. I was approaching the matter from the point of view of Government grants, and in the which to ascertain the sort of expenditure which you think it proper the State should undertake for the purposes of exhibitions?—I can quite conceive the case of an exhibition upon the Commission of which the Government might even be represented, where it did not perhaps call for a grant; but I think that would be exceptional.

4993. Still, you could contemplate that as conceivable?—I could do so.

4994. Would you say that the prestige and the power of negotiation conferred by Government participation were more important than the actual cash which the Government contributes?—Both.

4995. Do you mean that they are both equally important?—Both equally. I do not think that the prestige would be current coin; we should want the coin also. But, still, official sanction is very strongly desired by the country where the exhibition is, and the Government grant, apart from any other considerations of way and means, is also desired for the sake of its emphasising the official sanction; that is their view.

4996. Now, speaking of cases in which there is, or will be, a Government grant, would you confine the expenditure of that money to the expenses of organisation?—No, I would not. I think that it is in the interest of the country—and it is only on that ground that the action of the Government can be considered—that exhibitors should receive some assistance in exhibiting—not wholly, and sometimes not even chiefly, for themselves, but for the sake of putting in evidence in other quarters of the world our national industries.

4997. Would you advise that they should have grants towards the expenses of transport?—I think that would have to rest as an organic detail with the Commission, subject to any reservations the Government might make in making the grant. But there are cases in which I think transport would be a very important point, whether it was sea or land transport, in my opinion; for instance, if you were to go to a distant point like Sydney.

4998. If you look at exhibitions merely from the point of view of the benefit which they confer on industry and commerce, and leave out the political considerations, do you not think it may be said that some trades stand to gain a great deal more from exhibitions than others?—Undoubtedly; but we have in certain and many matters to view the nation as a whole. Some classes get more benefit out of taxes than others, but all pay taxes; and so with regard to other contributions.

4999. Then would you think it justifiable to spend money in a direction where only certain traders can get a direct advantage from it, whereas others would get very little?—You know you have put the most extreme case.
